THE

GARDENERS' CHRONICLE

A Weekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL XLII.—THIRD SERIES.

JULY TO DECEMBER, 1907.

LONDON:

41, WELLINGTON STREET, COVENT GARDEN, W.C.

1907.

INDEX OF CONTENTS.

JULY TO DECEMBER, 1907.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS, NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABIES pectinata, disease in, 265
Abutilon vitifolium in a Bourne-mouth garden, 26
 Accessories, the use of, 397
 Acclimatisation of plants, a conference on, in America, 185
Acer platanoides, the course of flowering in, 111
Aconitum Napellus var. *eminens*, 219
Acrostichum, the genus, 427
 Acts, Insect and other Pests, 298
 Adams, J. (*Elementary Botany*), 186
Æschynanthus, select species of, 389
 Agricultural College, South-Eastern, 32, 234, 313
 Agricultural Education, Committee on, 11, 32, 52; returns, 415
 Agriculture in New Guinea, 234
 Allspice, the, in Trinidad, 396
 Alpine garden, the, 28, 45, 105, 163, 244, 275
 Alpine plants, some rare, 209
 America, *Chrysanthemums* in, 195; *Hippeastrums* in, 241, 258; new grains and other plants in, 281
 American Association of Park Superintendents, 69, 133, 218
 American blight, Apples resisting attacks of, 186
 American blight on Apple-tree roots, 283, 299
 American Gooseberry-mildew attacking the Red Currant, 26, 283; legislation upon the, 51, 406
 American Irises, 6
 American Seed Trade Association, 151
 American system of cultivating *Euphorbia* (*Poinsettia*), 281
Amicia zygomeris, 426
Amphicome Emodi, 74, 276
Anchusa italica, "Dropmore variety," 282, 299
Andromeda Catesbæi, 103
Anemone elongata in Sunnymead gardens, 127; *A. grandiflora* in Mr. Elwes' garden, 134
Angræcum Rothschildianum at Tring, 230
Anthemis Biebersteiniana, 244
 Anthracite coal for heating green-houses, 352, 401
Anthropodium cirrhatum, 235
 Ants as gardeners, 130; on a lawn, to destroy, 219
 Apiary, the, 9, 109, 183
 Apples Charles Ross, 331; Golden Spire, 309; Heinsberg's Nonpareil, 132; Mank's Codlin, 309
 Apples, flowering period of, 431; said to be proof against American blight, 186
 Apple trees, American blight on the roots of, 186, 283, 299; leaf-spot diseases of, 305; mildew on, 166
 Apple trees, planting of, on heavy land, 373
 Aquatic plants, hardy, 124
Aralia Moseri, an improvement on *A. Sieboldii*, 33
Arctotis aureola, 411; *A. decurrens*, the propagation of, 345; *A. × regalis*, 204
Argemone grandiflora, 113
Aristolelia Maqui, seeds of, 377

Arnold Arboretum, the, 449
Arpophyllum giganteum, habitat of, 162
Artemisia lactiflora, 426
Arthropodium cirrhatum, 379
Asparagus, culinary, damaged by caterpillars, 281
Asparagus pastorianus, 307
Aster sericeus, 342
Astilbe Davidii as a garden plant, 172; inferior varieties of, in gardens, 152
 Aston Rowant House, Oxfordshire, 196
Athyrium Filix-fœmina "Kalothrix cristatum," 125
Auricula, the, 405, 438
 Austin, Alfred (*The Garden That I Love*), 330
 Australia, Lemon curing in, 407; Oranges from, 24
 Austria, union of gardeners in, 171

B

Bacteria and root-action, 112, 170
 Bactericide, carbon dioxide as a, 415
 Ballantine, Henry, awarded the Victoria medal of horticulture, 200
 Balsams, the decorative value of, 439
 Bamboos in Leonardslee gardens, 356
 Bananas, bird's nest in a bunch of, 72; as food for cattle, 395; in Costa Rica, 450
 Bank, plant for a dry, 105
 Battersea Park, gardening in, 101
 Bean Scarlet Emperor, 278
 Beans, early varieties of, 195
 Bedding plants, summer, 192
 Bees, the diseases of, 132; the management of, 9, 109, 183
 Beetle, the Narcissus, 407
 Beet, Silver or Spinach, 256, 374
 Behrens, Prof. D. J., appointment of, 131
 Belgian garden, a, 315
 Benevolent Institution, Gardeners' Royal, 10
Berberidopsis corallina, 390
Berberis, a natural hybrid of, 361
Berberis Fremontii, 390; *B. Wilsonæ*, 372
Berkheya purpurea, 342
 Biologists, Economic, Association of, 51
 Birds and the use of gas-tar in water, 352
 Birthday Honours to horticulturists, 345, 362
 Bisset, Peter (*The Book of Water Gardening*), 386
 Black Currant-mite, treatment for, 189
 Black scab disease of Potato, 299, 397, 417
 Blancard Fund, the, 202
 Blencowe, Mr. T., presentation to, 51
Bœnnighausenia albiflora, 292
 Bones for a vine border, 14, 75
 Books, a bogus offer of, 97; a sale of botanical, 51

BOOKS, NOTICES OF:—A Dictionary of Botanical Terms (*A. M. C. Jongkindt Coninck*), 314; Bees for Pleasure and Profit (*G. Gordon Samson*), 127; Botanical Magazine, 32, 110, 202, 265, 330; British Rainfall for 1906 (*Dr. H. R. Mill*), 280; Bulletin de la Société Française d'Horticulture de Londres, 298; Das Buch der Nymphaeaceen oder Seerosengewächse (*F. Henkel*), 107; Die Moderne Teppichgartneria (*W. Hampel*), 108; Elementary Botany (*M. A. Liversidge*), 449; Flower Decoration in the House (*Gertrude Jekyll*), 7; Flowers and Trees of Palestine (*Augusta A. Temple*), 61, 96; Flowers of the Field (*Rev. C. A. Johns*), 107; Forage Crops for Soiling, Silage, Hay, and Pasture (*G. B. Voorhees*), 361; Fruit Recipes (*Ridley M. Fletcher-Berry*), 7; Gardening in Town and Suburb (*Harry H. Thomas*), 386; Grapes and How to Grow Them (*J. Landsell*), 373; Handbook on Bulbs (*S. Arnott*), 111; Hortus Duroverni (*W. Masters*), 173; Icones Selectæ Horti Thensis, 330; Italian Gardens (*George S. Elgood*), 325; Journal of Agricultural Science, 185; Journal of the British Gardeners' Association, 217; Journal of the Royal Horticultural Society, 111; Lectures on Plant Physiology (*Dr. Ludwig Jost*), 179; Les meilleurs Fruits (*Nat. Hort. Soc. of France*), 73; Nos Arbres (*H. Correvon*), 92; Our Trees and How to Know Them (*Francis George Heath*), 298; Publications received, 12, 33, 52, 73, 92, 133, 171, 266, 298, 314, 330, 345, 436; Quarterly Journal of Forestry, 91; Report on Economic Zoology (*Fred. V. Theobald*), 127; Report on the Injurious Insects and Other Animals Observed in the Midland Counties during 1906 (*Walter E. Collinge*), 146; Report on the Phenological Observations for 1906 (*Edward Mawley*), 184; Reports of the South-Eastern Agricultural College, Wye (*E. S. Salmon*), 179; Rock and Alpine Gardening (*H. Hemsley*), 45; Souvenir of Shrewsbury Great Flora Fête (*W. W. Naunton*), 139; Studies in Plant Life (*J. Adams*), 185; The Art and Craft of Garden-making (*T. H. Mawson*), 146; The Book of Fruit Bottling (*Edith Bradley*), 292; The Book of Rock and Water Gardens (*Charles Thonger*), 95; The Book of Water Gardening (*Peter Bisset*), 386; The British Bee-keepers' Guide Book (*T. W. Cowan*), 292; The Garden That I Love (*A. Austin*), 330; The Insect Hunter's Companion (*Rev. Joseph Greene*), 127; The Studio (*Chas. Holme*), 435; The Wild and Cultivated Cotton Plants of the World (*Sir George Watt*), 241; Weather (*Hon. A. Stanhope*), 169

Bordeaux mixture, an economical method of preparing, 150
 Botanic Garden, Maritzburg, 63; New York, 33, 151
 Botany, applied, 328
 Boughton Park, *Hydrangea Hortensia* at, 152
 Bouvardias, the culture of, 307; a select list of, 346
 Bradley, Edith (*The Book of Fruit Bottling*), 292
 Braiswick Nursery, celebrations at, 151
 Bravoa × *Polianthes*, 219
 Brickellia grandiflora, 342
 British timber, value of, 193, 219
 Broad Beans cooked as Scarlet Runners, 54
 Broadway, Mr. W. E., 250
 Brooms, the hardy, 225
 Brussels, a Colonial garden in, 302
 Brussels Botanic Garden, list of plants cultivated in the, 132
 Bud-disease of Lilac, 73
Buddleia Colvillei, 26, 54, 124, 152; *B. globosa*, 26
 Bulb-business in Japan, the, 249
 Bulb garden, the, 179, 198
 Bulb mite, remedies for, 336
Bulbophyllum pavimentatum, 387; *B. Sanderianum*, inflorescence of, 106
 Bulbous plants, the forcing of, 369
 Bulbs, purchasing of, 216, 250; for the London parks, 250
 Burghley House, Stamford, 307
 Burning bush (*Rhus Cotinus*), 252
 Bushey House, Herts, 261

C

CÆSALPINIA japonica, 43
 Cairns, Richard, appointment of, 449
Calceolaria hyssopifolia, 48
 Calcium carbide refuse as a manure, 336
Calophaca wolgarica at Comely Bank Nurseries, 197
 Cambridge, forestry at, 151; scientific research at, 185
 Campanula "China Cup," 197; *C. elatinoïdes* and *C. e. Elatines*, 210; *C. grandis* in the rock-garden, 126; *C. michauxioides*, 45; *C. mirabilis* flowering at Valleyres, Switzerland, 144; *C. petraea* at Belgrove, 197; *C. phytidocalix*, 342; *C. punctata*, 95, 96; *C. Rainieri*, 209; *C. rotundifolia*, var. *Alaskana*, 126; *C. r. var. alpina*, 127; *C. Van Houttei*, 126
 Camphor industry, the, 52
 Canada, a nurseryman's visit to, 171; emigration to, 416; fruit crop in, 281; horticulture in, 126, 410; Tomato culture in, 52
 Canker, the Larch, 353
 Cannas, a trial of, 135, 206
 Carbon dioxide as a bactericide, 415
 Cardoons, the culture of, 374
Carladovica palmata, inflorescence of, 322
 Carnation "Andrew Carnegie," 169; Aristocrat, 429

Carnation, Clove, sports of the, 172, 187, 205, 218
 Carnations at Luton Hoo gardens, 75; at Stanley Park gardens, 74; tree or perpetual-flowering, 251
 Caryopteris Mastacanthus, 408
 Cassava, bitter, the poisonous properties of, 435
 Caterpillars damage Asparagus, 281
 Cattleya Warscewiczii, a remarkable specimen of, 313
 Cedar of Goa, hardy, 299; at Aston Rowant gardens, 252
 Celeriac, the culture of, 373
 Celery, a disease of, 271
 Celosia cristata, the culture of, 362, 378, 401, 452
 Cerasus laurocerasus, timber of, 219

CERTIFICATED FRUITS AND VEGETABLES.—Celeries, varieties of, 453; Damson "Merryweather," 319; Melons: "Advance," 136; Chas. Ross, 154; Diamond Jubilee, 136; Duchess of York, 154; Eastnor Castle, 136; Empress, 136; Perfection, 154; Sutton's Scarlet, 136; Onion Excelsior, 286; Pear Beurré Narghan, 420; Potatoes: Favourite, 154; Longkeeper, 285; The Provost, 285; Strawberry Fillbasket, 77; Tomato Up-to-Date, 286

CERTIFICATED PLANTS.—Ampelopsis Veitchii, var. Lowii, 253; Angraecum Buyssonii, 381; Arachnanthe Rohaniana, 285; Arctotis regalis, 190; Asters Amellus "H. J. Cutbush," 317; Miss Southall, 284; Miss Stafford, 206; Mrs. Davis Evans, 206; Nora Peters, 253; White Queen, 206; Begonia Miss Clibran, 347; Berberis Wilsonæ, 284; Brasso-Cattleyas: Mary, 37; Siren, 420; Brasso-Lælio-Cattleya Rowena, 190; Bulbophyllum longisepalum, 154; Campanula longistyla, 116; C. persicifolia var. Wm. Lawrence, 76; Cannas: Burbank, 206; C. J. B. van der Schoot, 135; Duke of York, 206; Elizabeth Hoss, 135; Gladiator, 135; Hesperide, 206; Mme. Louis Voraz, 190; Venus, 206; William Bofinger, 135; W. Saunders, 135; Uncle Sam, 135; Carnations: Beacon, 317; King Edward VII., 116; Melody, 449; Mrs. T. Couthwaite, 190; Rose Pink Enchantress, 317; Winsor, 317, 449; Catasetum laminatum, 254; Cattleyas: Alicia, 318; Armstrongia magnifica, 285; Fabia gigantea, 318; fulvescens, Westonbirt variety, 318; Germania superba, 117; Hardyana, var. Mme. Valcke, 191; Hardyana, Westonbirt variety, 285; Iris His Majesty, 190; labiata Augusta, 318; labiata Daphne, 285; labiata alba Purity, 318; Macænas, var. Thor, 77; Waldemar, 77; Chrysanthemums: Bessie Evans, 363; Blanche, 402; C. H. Curtis, 253; Clara Vurnum, 317; Clara Wells, 317; Crown Jewel Improved, 334; Doreen, 402; Edith Jameson, 380; Elsie Matthews, 334; E. Nottell, 334; Esme Reed, 284; Etruria, 253; Felton's Favourite, 334; Foxhunter, 346; Frank Payne, 346; Freda Bedford, 334, 346; F. W. Lever, 317; Geo. Mileham, 334; H. J. Jones 1908, 284; La Cygne, 255; Mab Ellis, 363; Marquis of Northampton, 363; Minnie Carpenter, 255; Mrs. G. F. Coster, 317; Mrs. J. Hygate, 363; Mrs. Wakefield, 317; Robjaut, 334; Romance, 317; Splendour, 317; W. J. Higgs, 334; Cirrhopetalum Makoyanum, 381; C. retusiusculum, 420; Cotoneaster applanata, 253; Crinum × H. J. Elwes, 35; C. Mearsii, 35; Cyclamen latifolium

fimbriatum giganteum, 318; Cymbidium Humboldtii, 37; Cypripediums: Beryl, 420; Ernest Read, 381; Fairrieum Black Prince, 420; insigne Gwynedd, 429; Nandii, Low's variety, 285; nitens Læanum, var. Hannibal, 347; niveo-callosum, Cookson's variety, 381; San-ac-deræ superbum, 381; Dahlias: Alice, 190; C. E. Wilkins, 207, 220; Clara, 253; Crimson Prince, 207; Cynthia, 221; Dorothy, 220, 253; Elsa Ellrich, 190; Flame, 207, 220; Harold Peerman, 253; Helium, 253; Ivernina, 207, 220; Mauve Queen, 190, 207; Peggy, 190, 207; Rev. A. Bridge, 207, 220; Saturn, 253; The Bride, 207; Delphiniums: Alake, 35; Mrs. G. Ferguson, 76; Rev. E. Lascelles, 35; Dendrobium regium, 116; Dossinia marmorata, 77; Epidendrum campylostolix, 221; Eucalyptus ficifolia, 116; Eulophia ensata, 191; Fuchsia Coralle, 190; Gaillardia grandiflora "Lady Rolleston," 190; Gladiolus Duke of Richmond, 116; G. Purity, 190; Habenaria Ugandæ, 347; Hedera dentata variegata, 35; Juniperus chinensis nana aurea, 380; Lælio-Cattleyas: Berthe Fournier, var. tigrina, 420; Clive, Lambeau's variety, 37; Epicasta "The Premier," 318; Ortrude, 381; The Duchess, 254; Larkspur Carmine Empress, 206; Lychnis grandiflora, 190; Matricaria inodora Bridal Robe, 116; Miltonia Schröderiana "Heaton variety," 154; M. vexillaria Lambeau's variety, 77; M. v. Lambeauiana, 117; Montanoa bipinnatifida, 418; Montbretias: King Edmund, 220; Lady Hamilton, 220; Lord Nelson, 220; Nepenthes Ruby, 284; Nephrolepis exalta superbissima, 346; Nerines: F. D. Godman, 318; Purple Princess, 346; Nymphaea atro-purpurea, 116; Odonotoda Devossiana, 318; Odontoglossums: John Clarke, 381; Pescatorei ornatum, 254; Pentstemon (strain), 190; Phlox George Stocklein, 253; Polycynis Charlesworthii, 154; Polystichum aculeatum pulcherrimum Druryi, 253; Roses: Goldfinch, 36; Hugo Roller, 76; Joseph Lowe, 36; Lady Helen Vincent, 36, 39; Mrs. Harold Brocklebank, 36; Queen of Spain, 39; Souvenir of Stella Gray, 36; Rubus bambusarum, 153; Scabious, Dobbie's strain, 253; Solidago Golden Wings, 284; Sophro-Cattleya eximia, Fowler's variety, 419; Sophro-Lælias: Antiochus, 221; Gratrixia magnifica, 221; Sophro-Lælio-Cattleyas: Medea, 318; Phyllis, 191; Spiraea Camtschatica rosea, 76; Stanhopea platyceras, 190; Stock "White Wallflower Leaved," 206; Streptocarpus Burdett's strain, 153; Sweet Peas: Elsie Herbert, 36, 56; Evelyn Hemus, 56; Nancy Perkins, 56; Princess Victoria, 36; Rosie Adams, 56; Silas Cole, 56; St. George, 36, 56; The Marquis, 56; Viburnum rhytidophyllum, 220; Vitis leucoides, 253
 Chapman's, Samuel, long service, 416
 Charities, garden, and admission fees to private gardens, 91
 Cherry-laurel timber, 219
 Cheal, Mr. J., visit of, to Canada, 171
 Chelsea Physic Garden, lectures at, 361
 Chemical fumes and tree growth, 103
 Chermes strobilobius, the Larch-gall insect, 353

China, plant collecting in, 344
 Chrysanthemums, 328; American varieties of, 387; Anemone-flowered varieties of, 377; a select list of early-flowering, 293; at Messrs. Lowe & Shawyer's nursery, 267; Australian varieties of, 411; colour variation in, 400; cross-fertilisation of, 282; disease, a new, 213; duplicate blooms of, in exhibits at shows, 452; early, at the Paris show, 387; exhibiting on boards v. vases, 269, 280, 282, 316, 331, 452; exhibits of decorative 411; for market, 256, 384, 424; "F. S. Vallis" at the Paris Show, 387; Incurved, 411; in the present season, 152; in the United States, America, 195; late propagation of, 378; Mme. Paolo Radaelli at the Paris Show, 387; naming varieties at shows, 388, new French varieties of, 377; notes of, 339, 377, 387; out-of-doors, 267, 388; select varieties of, 339; show of, in Paris, 298; cross-fertilisation of single, 267; culture of the "single" type of, 388; some popular varieties of, in France, 387; sporting in, 362; the best new varieties of, 306
 Cirrhopetalum appendiculatum, variety Fascinator, 260; C. maculosum, 106
 Cladrastis tinctoria flowering at Kew, 186
 Clerodendron foetidum, 408
 Clethra alnifolia, 45
 Clog soles, timber used in making, 112
 Clove Carnation, sports of the, 172, 187, 205, 218
 Coal, anthracite, for heating greenhouses, 352, 401
 Cockroaches, to destroy, 417
 Cockscombs, the culture of, 362, 378, 401, 452
 Coconut fibre mats, 33
 Colchicum Bornmuelleri, 323; C. speciosum rubrum splendens, 323
 Cold storage of fruit, 346
 Collinge, Walter E. (*Report on Injurious Insects*), 146
 Colman, Sir Jeremiah, 345, 363
 Colonial notes, 8, 24, 66, 93, 106, 126, 195, 227, 267, 429
 Colonial products, an exhibition of, 335
 Colonies, economic plants in the, 107
 Colour variation in Chrysanthemums, 400
 Comarella multifoliata, 151
 Combretum purpureum, culture of, 246
 Commissions, secret, 11
 Conference on Plant Hardiness and Acclimatisation in America, 185
 Conifer, a rare, 209
 Coninck, A. M. C. Jongkindt (*A Dictionary of Botanical Terms*), 314
 Coniothyrium (disease of Gooseberry), 341
 Convulvulus cneorum, 106
 Cornish garden, a, 228
 Correvo, H. (*Nos Arbres*), 92
 Coryanthes speciosa, 106
 Corydalis cheilanthifolia, 428
 Cosmos sulphureus, 150, 267
 Costus igneus, cultural note on, 214
 Country garden, the, 3, 81, 161, 226, 293, 389
 Cowan, T. W. (*The British Bee-keeper's Guide Book*), 292
 Cricket, gardeners at, 266
 Crisp, Sir Frank, 345, 362
 Crocuses, autumn-flowering, 211, 229; winter-flowering, 396
 Crocus pulchellus, 323
 Cross-fertilisation of Chrysanthemum, 267, 282
 Cuckoo reared in a flower basket, 97
 Cucumber, "Butcher's disease-resisting," 152

Cucumber disease, treatment for, 40
 Cupressus lusitanica, 252, 299
 Currant bushes attacked by Gooseberry-mildew, 283; affected with Gloeosporium disease, 180
 Currant-gall mite, the, 189
 Cuttings, the preparation and treatment of, 67
 Cyclamen, best time to sow seeds of, 134, 172, 188
 Cypripedium bellatulum hybrid, 260; C. Parishii at Forty Hill, Enfield, 162; C. Spicerianum, 230
 Cytisus albus, 91; C. proliferus as a fodder plant, 344
 Cytisus, hardy garden, species of, 225

D

DAHLIA exhibitor, fatality to a, 203
 Dahlias in America, 112
 Dalton Holme, Beverley, 141
 Damson season, the, 267
 Daphne laureola purpurea, 390; D. petraea (syn. D. rupestris), 209
 Darlingtonias and Sarracénias at Leonardlee Gardens, 54
 Death's Head Hawk-moth, the, 176
 Debating societies, question night at, 152, 173, 400; union of, 249, 283, 345
 Defoliating Tomato plants, 172
 Dendrobium aphrodite, 291; D. calceolaria, 4; D. nudum, 386; D. regium, 122
 Destructive Insects and Pests Acts, 51, 298, 313
 Dickson, Mr. George, awarded the Victoria Medal of Horticulture, 201, 218
 Diervilla sessilifolia, 427
 Digitalis purpurea, 213
 Diospyros Kaki, 22, 54
 Diseases, plant, 394
 Disease of the Silver Fir, 265; of Chrysanthemums, 213; a new, of the Gooseberry, 341
 Distribution of Ferns, 308
 Doe, J., presentation to, 250
 Donegal garden, a, 103
 Dracopcephalum heterophyllum, 342
 Dry-rot fungus (Merulius lacrymans), 272
 Duff House for public use, 218
 Durban, town garden at, 32

E

EAST Burnham Park, nursery employees' visit to, 132
 Eastwell Park, Kent, 337, 355
 Economic plants in the British Colonies, 107
 Egypt, horticulture in, 41, 73; the Onion crop in, 112
 Electric light, experiments with, in plant growth, 218, 254
 Elgood, George S. (*Italian Gardens*), 325
 Emigrants for New Zealand, 195
 Epacris, the propagation of, 431
 Epidendrum erubescens, 323; E. laucheanum flowering at Glasnevin, 277
 Eremurus chinensis, 330; E. robustus, culture of, 134
 Ericas, the propagation of, 431
 Erigeron glaucus at Sunnymead gardens, 275
 Eritrichium nanum at Floraire, 24
 Escallonia pterocladon at Edinburgh Botanic Garden, 162; E. rubra in the west of England, 44
 Eucalyptus ficifolia, 376, 418
 Eucryphia cordifolia in Mr. Gumbleton's garden, 259; E. pinnatifolia, a fine specimen of, 188

 Plants, fragrant, 389

PLANTS, NEW OR NOTEWORTHY: - Bulbophyllum Binnendijkii, 161; B. galbinum, 42; B. longisepalum, 210; Campanula longistyla, 193; Crinum amœnum, 62; Dendrobium acuminatum, 210; Dipelta floribunda, 3; Eria rhyncostyloides, 370; Felicia (Agathæa) petiolata, 81; Odontoglossum Ariadne, 101; O. Astræa, 42; O. × Kenchii, 3; Passiflora × Allardii, 274; Rinderia umbellata, 226; Zaluzianskia maritima, 161
 Plants under glass, 8, 29, 48, 69, 83, 108, 128, 149, 182, 199, 214, 231, 247, 263, 278, 311, 327, 343, 359, 375, 392, 413, 432, 446
 Plum, the yellow fruited Mirabelle, 452
 Plums and their value, 232; a second crop of, 361; late-ripening, 273; silver-leaf disease of, 205
 Podocarpus Nageia at Pencarrow gardens, 44
 Podosphæra leucotricha, the Apple mildew, 166
 Poisoning by Mushrooms, 235
 Poisonous properties of Primula obconica, 173, 205
 Polemonium confertum melitum, 94
 Polygonum Baldschuanicum in Switzerland, 24; P. vacciniifolium, 275
 Polypodiums, some, in Trinidad, 252
 Polystichum aculeatum var. pulcherrimum Drueyri, 273
 Populus canescens, 124
 Potash, effect of, on leaf growth, 340
 Potato, black scab or warty disease of, 299, 397, 417
 Potato Highlander, 332; origin of the, 33; species at Reading, 53; supposed mutation in, 97; trials at Reading 184; trials at Wisley, 285; trials in Scotland, 277; tuber in the axil of a leaf, 160; warty disease of, 299, 397, 417; winter rot disease of, 345
 Potatoes, a large crop of, 378; from seed, 265; the species of, 53
 Prevention of Corruption Act 1906, 439, 451
 Primula obconica, the poisonous properties of, 173, 205
 Propagation by cuttings, 67; by layering, 341; of Petrus, 406; of Montbretias, 306; vegetative, of leguminous forage plants, 396

Propagator, the, 67, 148, 341, 431
Pruning of fruit trees, summer, 14,
33, 54, 75, 97, 152, 296, 299, 316
Prunus japonica, 262; *P. spinosa*,
308
Public parks and gardens, 9, 29,
49, 69, 83, 109, 129, 148, 182, 199,
215, 231, 246, 263, 279, 295, 310,
327, 343, 358, 375, 392, 412, 433,
447
Purchasing bulbs, 216, 250

Q

QUEENSLAND, Ginseng in, 436
Quercus Ilex as a hedge plant, 390
Quince, the, 450

R

RAINFALL, British, 280; deficient,

from, at Oxford, 234
School of Horticulture at Wisley,
64
Schwappach, Professor, appoint-
ment of, 12

SCIENTIFIC COMMITTEE:—Acorns,
change of colour in germinating,
206; *Akebia lobata*, fruits of,
453; *Antirrhinum*, peloric flowers
of, 136; Anthracnose on Plums,
174; Aphides on Palm roots,
174; Apple, a seedless, 453;
Apple shoots injured by bind-
ing, 319; Apples, twin, 174;
Aster, a double, 237; Bean
flowers, the colour of, 287;
Beech foliage, variation in, 174;
Beech trees dying, 97; Broom,
curious growth on, 135; Bulbils
on stem of *Lilium candidum*,
270; Cabbage, an abnormal,
16; Cabbage, the Marrow, 332;
Calycanthus, fruits of, 270, 332;
Carnation flowers, rotting, 16;
Carrot, a malformed, 237; Cat-
tleya, malformed, 332; *Cero-
pegia*, a hybrid, 174; Chlorosis
in fruit trees, 98, 135; Chrysan-
themum indicum hybrids, 401,
452; Clover, an improved variety
of, 15; *Coleus* sporting in, 16;
Cotyledon, buds on, 270;
Cribbraria, sporting of, 453;
Crinum augustum exhibited,
135; *Crocus* species, 332; Cup-
shaped leaves of *Saxifraga*, 332;
Currant leaves diseased, 205;
Dianthus, a "Wheat-eared,"
270; Disease of Potato, a, 237;
Dye plants, British, 206; Electri-
cal currents and plant life, 453;
Elm, effect of lightning on, 174;
Ergot on Rye-grass, 401; Fasci-
ation in *Lilium candidum*, 97;
Fig leaves diseased, 205; Fruit-
trees, chlorosis in, 98, 135;
Fungi and Orchids, 401; Fungi,
uncommon, 270; Galls, Cali-
fornian, 453; on Walnut leaf,
205; on Willow, 97; Ger-
mination of seeds in steri-
lised soil, 97; *Glœosporium* ner-
visequum attacking shoots of
Plane, 16; *G. ribis*, a disease of
Currants, 205; Gooseberry-mil-
dew, the European, 205; hybrid
Orchids, 401; *Ithyphallus canis-*
mus, 270; Kale with hypertro-
phied leaves, 332; leaf diseases,
some, 237; leaves, cup-shaped,
332; of *Pelargonium*, 319; light-
ning, effect of, on an Elm tree,
174; *Lilium candidum*, bulbils
on stem of, 270; *Lilium candi-*
dum, fasciation in stem of, 97;
Lueddemannia Pescatorei ex-
hibited, 98; malformed *Cattleya*,
332; Maple, mildew on, 205;
Marrow Cabbage, Chou Moellier,
332; Masters, the late Dr. M. T.,
15; proposed memorial to, 97;
Mendelian laws and colour in
Beans, 205; Mendelian laws and
Sweet Peas, 15; *Microsphaera*
grossulariæ (Gooseberry-mildew),
205; *Miltonia vexillaria*, a double
flower of, 16; Mint rust disease,
205; *Myosotis*, malformation in,
205; *Narcissus*, "yellow-stripe"

disease of, 135; *Neobenthamia*
gracilis exhibited, 174; Orchids
and fungi, 401; Orchids, hybrid,
401; Orchids, hybrid, from
Glasnevin, 319; Orchids, mal-
formed, 362, 401; Palm-roots,
aphides on, 174; Peach disease,
reappearance of a, 174; Peach,
the Blood, 237; Pear, a red-
fleshed, 237; Pear × Quince,
237, 332; *Pelargonium* leaves,
cup-shaped, 319; Plane diseased,
16; Plum, Anthracnose on, 174;
Polyporus hypolateritia, a dis-
ease of Tea plant, 319; Potato
disease, a, 237; Potato diseases,
the propagation of, 205; Pruning,
summer, a discussion on, 299,
453; *Puccinia menthæ*, a disease
of Mint, 205; *Pyrus malus flori-*
bunda, fruits of, 174; Quince ×
Pear, 332, 363; Rye-grass, ergot
on, 401; *Saxifraga* *Cotyledon*,
401; *Saxifraga*, cup-shaped
leaves of, 332; Seeds, the ger-
mination of, in sterilised soil,
97; *Sempervivum spinulosum*, a
malformed inflorescence of, 206;
Septoria lycopersici, 174; Straw-
berry, the Plymouth, 135; Sum-
mer pruning of fruit trees, 299;
Sweet Peas and the Mendelian
laws, 15; Symbiosis in Orchid
roots, 401; Tea-root disease of
Ceylon, 319, 362; Temperature
variations, 453; Tomatos af-
fected by *Septoria lycopersici*,
174; *Ustilina*, a fungus causing
disease in roots of the Tea plant,
362; Vice-chairmen, appoint-
ment of new, 15; Walnut leaves,
galls on, 205; Wheat-ear Dian-
thus, 270; Willow, galls on, 97;
Yellow-stripe disease of *Narcis-*
sus, 135
Science laboratory opened at Wisley
Gardens, 70
Scion and stock, mutual relations
of, 414

THE LIMITATIONS OF GARDENING.

THE pleasures associated with the practice of gardening depend very greatly upon atmospheric conditions. When these are almost perfect—an experience of late years sufficiently rare; when we have days of brilliant sunlight, whose splendid monotony is enlivened at intervals by gentle summer showers, drooping like mercy, as described by Shakespeare, “upon the place beneath”; when fruits, nourished and stimulated by beneficent influences, are seen growing perceptibly day by day; then the heart of the horticulturist rejoices, for nature is his friend. But when—as during the last two months in Scotland—this radiant picture of steadfast growth and perfect evolution is entirely reversed; when the heavens are almost continually darkened, and there is more than an abundance of cold and cheerless rain; when for days there is not a smile of sunshine to brighten the foliage, or revive the drooping flowers; then the penalties of horticulture begin to appear. Calamities, it has been said, seldom come singly, and it is chiefly when suffering from such conditions

of earth and atmosphere, excessive moisture, and winter-like depression, that the “monstrous regiment” of insects, aided materially by rats and voles, begin their operations, seeking assiduously amid our fairest floral treasures what they may devour. Little wonder that before the insidious attacks of such enemies as these the patience of the horticulturist becomes exhausted; that his exercise of the high qualities of faith, and of perseverance in the garden, seems utterly in vain; his thoughts on such occasions, instead of being reverential, are almost profane. In a single night his culinary Peas (though coated carefully with red lead before being hopefully committed to the well-prepared ground), entirely disappear, eaten down by their ravenous, nocturnal foes. Perhaps his saddest reflection is this: that he has not the pleasure of shooting these antagonists, which, as soon as they hear him entering his earthly paradise, like the tent-lifting Arabs in Longfellow's poem, “silently steal away.” I write these words from sad and stern experience, and I feel that thousands of horticulturists at this moment, touched with a feeling for their own garden adversities, could effectively do the same.

Entomology is an extremely attractive subject for the scientific specialist, who revels in the study of insect life; but to the cultivator it is not quite so inspiring. He beholds with emotions akin to despair the tender leaves of his finest Plums and Cherries almost wholly destroyed; his Oriental Lilies decline to “rise to the occasion” when the vernal season comes, because their precious bulbs have, by the secret agencies of pernicious pests, been secretly consumed; and he is utterly impotent, for the prevention of such evils is beyond his utmost power. Nor are his quite involuntary entomological studies more edifying to the ardent rosarian; he cannot contemplate without visible emotion the tender, richly-coloured flower-shoots of his Rose trees, rendered useless by green-flies, whose most notable characteristic is their power of multiplication; he cannot overlook, with all his tenderness, the dissimulation of the caterpillar, as he hides himself by day between two closely-folded leaves; like a burglar, says Dean Hole, who conceals himself in the shrubbery, before making a nocturnal attack upon the silver in the dining-room.

It is manifest, therefore, that the affirmation of Wordsworth, “Nature never did betray the heart that loved her,” is not always expressive of horticultural conviction. Especially in such a season as we have recently experienced, the stern reverse is true. Nevertheless, amid all atmospheric and earth-born tribulation shall we cherish the secret sunlight of cheerfulness and hope; for as one of our greatest moralists (and satirists) has said: “Man never is, but always to be blest.” David R. Williamson, Manse of Kirkmaiden, Wigtownshire.

MONREITH.

IN the south-west of Scotland, in that peninsula of Wigtownshire which terminates in the bold promontory of Burrow Head, lies the beautiful estate of Monreith, for centuries the home of the Maxwells of that ilk, and now the property of the Right Honourable Sir Herbert Maxwell, Bart.

It was with pleasurable anticipations that the writer made his way to Monreith recently, although the weather was of the most unpropitious kind and there seemed no prospect of even a gleam of sunshine.

The mansion of Monreith is one of those comfortable country houses belonging to the period which terminated the eighteenth century, and it is situated some little distance from an old tower which is all that remains of the ancient castle of the family, and in which King James IV. once passed a night. Although the exterior is comparatively plain, it is made picturesque by rambling and climbing plants.

From the library, direct access is provided by a French door and a flight of steps, to the garden front. The old garden is situated at the castle, but gradually the gardens at the present mansion are being extended and beautified in a most charming manner.

Beneath the windows are simple rock-beds filled with the best Alpine flowers, such as the spring-flowering Phlox, Androsace, Corydalis, Campanula, Dianthus, and other choice flowers of the kind. They are, as a whole, doing admirably, and, low as is the elevation, they are generally thriving better than in most gardens. Facing to the south-west, these beds, which consist of low mounds, almost level, with stones here and there, are excellent for the purpose.

Below the terrace, and a little in front of it, a wall garden has been constructed from rough stones found on the estate to take the place of steep, grass-covered terraces.

Above this wall is a border planted with some good Cisti, Veronics, and other shrubs of low growth, while the wall itself is being gradually furnished with flowering plants, and it is of much interest to observe the behaviour of some plants which are not hardy when planted on the level ground. Thus *Onosma taurica*, which died out last winter in the beds, is flourishing on the wall, although it has precisely the same exposure. Another plant of interest in this connection is *Gerbera Jamesoni*, which has survived the past winter planted in this wall, and was coming into flower. In gardens where it is difficult to keep this plant alive during the winter it may well be tried in the same position as at Monreith. *Incarvillea grandiflora*, *Saponaria Boissieri*, and other suitable Alpine plants were observed in this capital example of wall-gardening. The wall-garden is to be extended, and there is a continuation of the grass banks on either side which will afford a variety of position. Among other plants observed on the wall or the rock garden, and close to the house, were some of the best *Lithospermums*, including the species *Gastoni*, *prostratum*, *graminifolium*, &c., a number of *Belladonna Lilies* (rarely seen in the open in this part of Scotland), *Hypericum fragilis*, *H. reptans*, *Cheiranthus mutabilis*, *Ramondias*, and many more.

The flower garden at Monreith is of the most delightful character, and is composed of beds and borders cut in the grass or among the borders of shrubs and trees which surround the mansion and protect it from the strong sea breezes. One can wander among bays in the trees and shrubs and continually observe some new feature of pleasure in the shape of herbaceous plants or shrubs

arranged informally, in large groups as a rule. The collection of hardy plants is an extremely good one. There are bold groups of Funkias; Oriental and other Poppies; Asphodels, Anthericums; Phloxes, Geraniums, Lupins, Ononises (*O. rotundifolia* being very good indeed for the district), Libertias, *Orchis foliosa*, *Cypripediums*, such as *C. spectabile* (not very long lived here); *C. Calceolus*, and others. Large masses of *Trillium grandiflorum* were doing splendidly, and the flowers were probably finer than I have before seen them. The group figured in the *Gardeners' Chronicle*, June 22nd last, p. 412, was especially fine. *Primula japonica*

niums, Irises, and many other things, generally arranged with taste and having a charming effect with their settings of green turf and the beautiful shrub and tree life about and around them. Eremuri are not doing well at Monreith this season.

TREES AND SHRUBS.

One is at a loss to know which of the shrubs to select for mention. For many years Monreith has been noted for these, and the collection is always being added to from new or rare species and varieties as they come into commerce. Rhododendrons were very effective at the time of my visit. There are many

ing their surroundings. Of other shrubs there were noted *Andromedas*; *Ozothamnus rosmarinifolius* (growing splendidly), the tender *Embothrium coccineum*, which I was glad to find here; the beautiful *Edwardsia* or *Sophora tetraphylla*, in flower on the walls and thriving happily; *Chionanthus virginicus*, *Akebia quinata*, *Cordyline australis*, *Cassia fulvida*, *Indigofera Gerardiana*, *Enkianthus japonicus*, *Pittosporums*, *Hydrangea arborea*, *Lepedeza cyrtobotrya*, many good *Berberises*, including a specimen of *B. buxifolia* 13 feet high and 90 feet in circumference, referred to in this journal on June 22nd, p. 412; *Xanthoceras sorbifolia*, and many

FIG. I.—*DIPELTA FLORIBUNDA*, A HARDY SHRUB.

A, lateral petal; B, flower showing abortive bract; C, portion of corolla removed to show stamens and pistil. (See text, page 3.)

was very fine both in the woods and in the borders. Many noble plants of *Phormium*, which flower well, are here. I also saw the beautiful *Rodgersia æsculifolia* and *R. pinnata*, and a number of *Liliums*, such as *L. rubellum*, *L. giganteum*, of which there are many plants of various sizes, but few blooming this year; *L. pomponium rubrum*, *L. pardalinum*, *L. chalcodonium*, apparently slightly attacked with disease; *L. monadelphum*, *L. auratum*, and others, generally in splendid condition. These borders were also furnished with *Spiræas* and *Astilbes*, *Asters*, *Tropæolum polyphyllum*, *Delphi-*

beautiful hybrid *Rhododendrons*, but Sir Herbert Maxwell has more appreciation for the Himalayan and other species, which generally do so well here, that commoner kinds are being largely superseded by these grand shrubs. Great masses of *R. ponticum* which have been in the woods for years past are being cut out and the Himalayan species and other choice shrubs and trees are being planted in their stead. Specimens of such fine *Rhododendrons* as *R. arboreum*, *R. campanulatum*, *R. Falconeri*, *R. cinnabarinum*, finely in flower; *R. barbatum*, and many more were seen in perfect health, and evidently enjoy-

others. A critical examination of the trees of greater size would have occupied a whole day, and I must forbear any reference to them beyond mentioning the great number and variety of these in the vicinity of the mansion.

The old garden at the Castle, now unnecessary in view of the extensions at the mansion, is largely laid out in grass, but at an earlier time the flower garden must have been charming with the old building looking down upon it. Here is a fine row of *Cypresses* raised from seeds brought from Italy by Sir Herbert Maxwell.

THE VEGETABLE AND FRUIT GARDENS

are still near to the Castle, and here I found the usual requirements of an establishment such as Monreith well cared for. As a whole, the crops promised fairly well. An interesting plant here is the progenitor of the celebrated Castle Kennedy Fig. The vegetable garden contains the usual crops, with groups of flowers for cutting, and many seedlings of hardy plants, such as *Sparaxis pendula*, *Phormium tenax*, &c.

The glass is not extensive, but, in keeping with the rest of the gardens, is admirably cared for, under the charge of Mr. S. Gordon, the gardener.

There was much else to be seen in passing through the grounds, a pretty effect being made by the thousands of early-flowering bulbs. Not the least interesting feature is the manner in which plants are placed in bold groups in the woods.

Monreith is deeply interesting to the lover of plants, and its beauties show the impress of the love of nature possessed by Sir Herbert Maxwell, and which is so apparent to every reader of his many works. S. Arnott.

NEW OR NOTEWORTHY PLANTS.

DIPELTA FLORIBUNDA.*

THREE species of the genus *Dipelta* are recorded from China, namely, *D. elegans*, Batalin; *D. yunnanensis*, Franch. and *D. floribunda*, Maxim. An example of the last-named species has recently flowered in the Coombe Wood nursery of Messrs. James Veitch & Sons for the first time in this country.

Dipelta floribunda is a handsome deciduous shrub, allied to *Diervilla*, and was introduced to cultivation through Mr. E. H. Wilson, who sent living roots from Central China to Messrs. Veitch in 1902, and in 1904 a supply of seed collected on Mount Wa, in Western China.

The species was first collected around Hans-chunfoo, Shensi, by Dr. Piatetski, a Russian army surgeon attached to the Sosnovski expedition to China 1874-75, and on his specimens Maximowicz founded the genus.

Wilson in his notes describes it thus:—"A shrub 4 to 15 feet high, flowers white and pink, woods 4,800 feet, Wa Shan."

The plant at Coombe Wood is about 4 feet high, and in habit of growth and general appearance resembles a *Diervilla* (*Weigela*). The branches are covered with a light-coloured bark, which peels off the older portions of the branches; the young bark is reddish brown.

The leaves are opposite and decussate, ovate or ovate-lanceolate, acuminate, 3 to 3½ inches long by 1 to 1½ inches broad, shortly petiolate, covered with a short velvety pubescence on both surfaces and slightly toothed along the upper third of their margins.

The flowers are produced singly in the axils of the leaves or in racemes composed of four flowers terminating short growths which form along the whole length of the previous year's shoot. The slender, hairy pedicels are about ¾ inch long, and bear at the base two small bracts. The calyx is composed of five linear spreading sepals ½ inch long and attached to the sides of the inferior ovary are four bracts, two of which, the anterior and posterior, remain abortive, whilst the two lateral ones develop into large rounded flattened discs (*peltæ*) attached at the centre.

The corolla is tubular, about 1½ inch long, narrowed towards the base, where it is slightly spurred, inflated at the throat, expanding at the mouth into a two-lipped, five-lobed limb; the ex-

terior is rose-pink, passing to white at the mouth; the interior is white, with a yellow reticulation. The stamens are four in number, two of which are long, and two short; the filaments are attached to the corolla tube, the anthers dorsifixed. The style, about ¾ inch in length, is terminated by a simple stigma. Both stamens and pistil are enclosed in the corolla tube. According to the *Index Flora Sinensis*, the fruit is said to be an edible, red berry.

Plants have been growing at Coombe Wood in the open without any protection since 1902, and appear to be perfectly hardy. The dried specimens collected by Wilson show that the plant is extremely floriferous in its native habitat, and no doubt, when distributed, it will form an important addition to our hardy ornamental spring-flowering shrub. H. Spooner.

ODONTOGLOSSUM × KENCHII. (O. KEGELJANI × O. WILCKEANUM, VAR. MOSSIE.)

THIS interesting and beautiful hybrid has been raised by Mr. Christopher Kench, Orchid grower to J. S. Moss, Esq., Wintershill Hall,

FIG. 2.—MAGNOLIA CAMPBELLII FLOWERING IN LEONARDSLEE GARDENS, SUSSEX.

Bishop's Waltham, Hants, and is dedicated to him.

The parents were crossed in 1900, seeds were sown in 1901, and *O. Kenchii* bloomed in May, 1907. This long record is of one of the early attempts, for later crosses will bloom in a shorter period.

To clearly describe the hybrid I must first describe the pollen parent, which is probably not a true *Wilckeanum*, but a cross from *O. crispum* and *O. Wilckeanum*. In form it is much like *O. Wilckeanum albens*, but has a bright yellow ground, with rosy-tinted back; its sepals are marked with the usual blotch and two inferior large spots, also marginal spots. The petals have a few large spots loosely scattered over the median area, and the peculiar "eyebrows" of *O. Wilckeanum albens* arranged round their edges. The lip, which is oblong in form and yellow in colour, has one central large spot, and a few more below it at each side. The seed bearer was a good form of *O. Kegeljani*.

In form, the flowers of the hybrid are almost similar to the pollen parent, the segments being a little more "stalked" at the bases, as in *O. Kegeljani*.

Its ground colour is a rich chrome-yellow, with a rose-tinted back, the rose uniting with the yellow and showing through to the front. The sepals have the blotch of both parents, and some basilar marks around the column; the tips of the lower sepals are much spotted and stained; they also have the marginal spotting, though undeveloped at present. The petals have only a very few minute spots in their median areas, but the "eyebrows" are very distinct in a line of very small spots. The lip is large and oblong, white, slightly yellowish; it has a large horseshoe-shaped brown blotch across its centre, the remaining portion being unspotted. The shell-like shape of *O. Kegeljani's* lip has been overcome by *O. Wilckeanum*. The crest and column are intermediate between the parents.

This plant has not nearly attained its full development, and will be a very beautiful hybrid after acquiring greater strength. It may be termed a "sunset"-coloured flower. *O. Kegeljani* has been much neglected by hybridists, but it only needs a couple of good hybrids to appear, in order to create a sudden demand for it; the shade of yellow in its flowers is very effective, and ought not to be overlooked. De B. Crawshay.

MAGNOLIA CAMPBELLII.

THIS somewhat tender, but handsome species is of very shy-blooming habit in most districts, but especially in the neighbourhood of London; consequently, when flowers obtained from a tree growing in Sir Edmund Loder's garden at Leonardslee, Sussex, were exhibited at a meeting of the Royal Horticultural Society in April last, they created much interest. A photograph of the tree in flower (see fig. 2) has been kindly sent us by Mr. W. A. Cook, the gardener at Leonardslee, and it shows well the shy-flowering character of the species. It is the first occasion on which the tree at Leonardslee has flowered, although it is a specimen nearly 20 feet in height. In some of the warmest counties, however, it flowers with more freedom, and in a mild season a few years since, a plant in Mr. Gumbleton's garden at Belgrove in the county of Cork produced as many as 147 blooms, which opened freely. The individual flowers, one of which we reproduce at fig. 3, are globular in shape, and very delicately scented. The petals are a rich shade of rose-pink on the exterior, and creamy white inside, with marginal colour: the petals are wide and imbricate. It is a Sikkim species, and was figured in the *Botanical Magazine*, 1885, tab. 6793.

THE COUNTRY GARDEN.

ALTHOUGH wild flowers are plentiful outside the garden, yet it seems to me that nowhere is an illustration of wild gardening more suitable, artistic, or beautiful than in a country garden. There are often outlying portions that lend themselves with picturesque adaptability for this purpose, and with careful planting these wild quarters may become, as it were, beautiful "Nature" gardens, and no other portions will compare with them for ingratiating and subtle delight to those who know them. In a wild garden one loses, or should lose if it is to be worthy of its name, the sense of formality and the artificial conditions that are inseparable from the ordinary beds and borders, and gains a charming and distinct feature to act as a foil, and to enhance the charm and beautiful orderliness that is in the more prominent and formal portions of the garden. I do not think that the advantages of various special and distinct features in a garden can be too often insisted upon, and the wild portion may be made one of particular and peculiar value.

* *Dipelta floribunda*, Maxim., in *Mél. Biol.* X. (1877), p. 78.

So far as conditions go, I am inclined to think that a sparsely-wooded plot of ground is of all things to be desired; and, if there be fairly wide spaces that the sun can reach, so much larger will be the range of plants that can be grown. In planning, and in planting a wild garden, some people are too ready to consider the requirements of woodland flowering plants, and to forget the claims of plants that are sun-lovers and rock-lovers. They colonise bulbous plants, and forget how beautiful are the Rock-roses (*Cistus*) and the Toadflax (*Linaria*), and Lady's Bedstraw (*Galium*) in the wild garden where the site is open, and where, at the same time, they can be made to look in harmony and keeping with other subjects of the wild portion.

We certainly cannot afford to neglect flowering trees and shrubs here. To take but a few of our native varieties, the curious growth of Whitethorn is, quite apart from the beauty of its blossom, most picturesque. The wild Guelder Rose is charming enough at its flowering season, but every whit as pleasing when it looks like a burning bush of crimson foliage. A wild Crab Tree is a spring joy not easily forgettable; and the Spindle Wood (*Euonymus europæus*), inconspicuous so far as its blossom is concerned, yet produces seed vessels that present an unique combination of colouring, for the "arillus" is coloured brilliant orange in a setting of intense rose colour; scattered specimens of Broom and Gorze have their own value, and there are Honeysuckles and Sweet Briars!

I once saw an attempt at a wild garden that was pitiful, not because there were but few plants, but because the maker of it had been content, in the majority of cases, with just a plant or two of the different sorts. Here, an isolated stem arose of Solomon's Seal, there a single Foxglove, or a lonely Fern. No wild quarter was ever properly planted in that fashion. Nature preaches generosity, lavishness, profusion, and in planting a wild garden, it is one of the elements of success to plant with breadth and prodigality. Drifts of Wood Anemones, wide stretches of wild Hyacinths, blue masses of Violets, and these with Foxgloves, Heather, Primroses, and many another.

I am thinking, to-day, only of native plants, though a number of aliens are eminently suitable to combine and use in harmony with our own wildings, and some of these I shall hope to mention in a future article.

There are few plants more decorative in the wild garden than *Doronicum Pardalianches*. It is the latest of all the *Doronicums* to flower—this native species—so that we may count it a summer flower, and I need hardly say that it is far more difficult to have an effective summer garden where there is considerable shade to contend with, than it is during the spring. But *D. Pardalianches* will flourish under partial shade, and it has the virtue of flowering over a very long period. To all makers and lovers of wild gardens it is indispensable. It grows and flourishes almost anywhere, and the clear, bright, yellow flowers are remarkably pleasing. This plant is a wilding, and therefore we must not expect from it flowers of the size or even texture of such garden varieties as *D. plantaginum excelsum*. Let us take it for what it is—a beautiful English flower, attaining a height of 3 feet, and flowering from the middle of May well on into July.

Where there will not be the danger of it smothering other plants, a free hand can be used in planting *Asperula odorata*—the Wood-ruffe. This will grow, and not only grow but flower, under the densest shade—even the shade of a copse of Horse Chestnut trees, but I certainly would not establish it anywhere near Wood Anemones, or even Primroses, so rampant does it grow. But, where other good plants are absent, and as a splendid check to the growth of ordinary weeds, it is invaluable, and, in its flowering season, daintily beautiful to a degree. *Practical Gardener*.

ORCHID NOTES AND GLEANINGS.

ORNITHIDIUM MINIATUM.

A PLANT of this singular dimorphic species in the interesting group of rare Orchids arranged by Sir Trevor Lawrence, Bart. (gr. Mr. W. H. White), in front of the chair occupied by the Hon. Walter Rothschild, in presiding at the Anniversary Festival of The Gardeners' Royal Benevolent Institution at the Hotel Metropole on June 26, attracted much attention by reason of its extraordinary growth, or rather its two distinct kinds of growth. The basal or non-flowering part had ordinary pseudo-bulbs and leaves, as in many *Oncidiums*, from which arose leafy growths a foot or more in height and without pseudo-bulbs, the numerous bright red flowers being produced from the bases of the leaves of the upper part of the shoot. So remarkable is the difference between the two kinds of growths that they were taken by some to be of two distinct plants potted together.

Two pretty specimens of the orange-scarlet *Dendrobium Jerdonianum*, the singular little

sent by D. Campbell Brown, Esq., Bank of Scotland House, Oban, who flowered it, and many other pretty species out of a selection sent him by a friend in Burmah.

The variety known as *D. moschatum*, the largest form, is sent by Mr. J. Barnard, Mostyn Hall Gardens, Mostyn, N. Wales. The inflorescence is nearly one foot in length, and bears ten flowers, each nearly 3 inches across, and of a pleasing nankeen-yellow colour, slightly tinged with carmine on the sepals and bearing two reddish claret blotches at the base of the downy labellum. The variety *cupreum* has flowered with Mr. H. A. Tracy, Amyand Park Road, Twickenham. Its flowers are slightly smaller than those of *moschatum*, and of a coppery-orange tint, the blotches on the lip being reddish-purple. It is allied to *D. pulchellum*, Roxb. (*Dalhousianum*), the pseudo-bulbs being often 4 to 5 feet in height. The varieties are of easy cultivation if the plants are kept in a warm, moist house while the new pseudo-bulbs are forming, and rested in a cool and dry atmosphere after the completion of growth.

FIG. 3.—FLOWER OF *MAGNOLIA CAMPBELLII*: COLOUR RICH ROSY-PINK, WITH CREAM-COLOURED INTERIOR. (For text see page 3.)

Odontoglossum stellatum, *Cirrhopetalum gracilimum*, *Bulbophyllum Lobbii*, a pretty white *Octomeria*, *Cryptophoranthus Dayanus*, with its many singular flowers; *Barkeria spectabilis*, *Hartwegia purpurea*, *Epidendrum ochraceum* and many other singular species, including several of the lesser *Masdevallias* with insect-like flowers, were also in the arrangement

DENDROBIUM CALCEOLARIA (SYN. CALCEOLUS).

FLOWERS of this pretty and variable species have been sent by several correspondents, three of the spikes representing the extreme variations which often appear under other specific names. In size and colour they are perfectly distinct for garden purposes, yet no botanical feature is present which would warrant their separation, and all have an odour like new-mown Hay, always remarked in this pretty Burman species, and which is very pronounced in the whole plant when dried.

The typical form which has flowers rather smaller than the others, and of a lighter shade of yellow, with deeper purplish markings in the calceolate labellum is

THE ROSARY.

CULTURAL NOTES FOR JULY.

JULY and August are the two most important months in the year for the propagation of Roses out-of-doors by budding, and, after the showers lately experienced, such damp conditions with warm sunshine cannot fail to produce a vigorous growth in both stocks and flowering plants. Successful budding depends in a measure on the scions being selected from well-matured flowering wood, and in like manner the shoots to be budded should be well ripened, and the bark of both should open freely. The strongest growths near the top of standard Briars should now be in a suitable condition for budding. Morning and evening are the best times for performing the operation, and if the buds are well bound with suitable material they will not readily perish. If the standard stocks are not quite ready, make a start with the seedling Briars, and, in doing so, be careful to insert the buds several inches below the ground line, and as nearly as is possible on the roots. This will largely prevent suckers springing up from the base of the stock.

Rooted Briar cuttings are also very useful as stocks, but I find they do not carry so many fibrous roots as the seedlings, nor are they quite

such good growers. To return to the standards, be careful not to shorten back in any degree the shoot or stem that is budded until there is a complete union between the scion and the stock. The bud should be inserted on the upper side of the shoot, and as near to the main stem as is possible: the effect of this will be that a more compact "head" will be formed. In budding standard Roses I favour a longitudinal incision only, in preference to the T-shaped cut, as the shoots are not so liable to break from wind or other causes. It may be found that in some cases the bark does not run freely, owing to some check in the growth, or from its being hide-bound. If such is the case, the best plan is to cut an inch or two off the end of the shoot to induce lateral growths to form later and thus cause the sap to be more active. Budding on the Manetti, multiflora, and other stocks can be proceeded with later. At

pests, such as red spider and aphids, are sure to make an appearance. These must be kept in check by an occasional syringing of clear water or an approved insecticide. All climbing Roses of the Rambler type should have their old flowering shoots cut away when blooming is over, to make room for the young, healthy growth proceeding from the base of the plants. This practice is also applicable in a less degree to the Tea and Noisette section of climbers, but the pruning should not be done so severely in their case. If they are in pots, a weak solution of guano or Clay's Fertiliser will stimulate and strengthen the new growths. Roses on their own roots and grafted Roses in pots plunged outside will only require such attention as staking, watering, &c., until the autumn, as pointed out in previous notes. All the Tea and Hybrid Tea Roses that have been forced should be allowed a similar rest to those planted out under glass, and

on the former and H.P.s on the latter stock. This procedure gives a clear gain of a season, besides the securing of some of the choicer and rarer varieties at a comparatively trifling cost. J. D. G.

ROSA RUGOSA ROSERAI DE L'HAY.

THIS semi-double, deep brick-red-coloured variety, which was raised by M. Graverian in 1902 and put into commerce by Cochet, resembles the varieties raised by Dr. Muller. The female parent was *R. rugosa rubra*. The plant is of very strong growth, and it blooms abundantly from the end of the month of May until the autumn. The blooms are 3-4 inches in diameter. As a hedge plant in the park, or alongside a path, or as a single specimen or group on turf, it would have a good effect. The flowers bear a resemblance to *R. rugosa Germanica*, but they are handsomer and of darker tint.

(Photograph by F. Mason Good.)

FIG. 4.—ROSE MADAME PLANTIER; AN EXCELLENT WHITE-FLOWERED VARIETY FOR PERGOLAS.

the time of writing these notes there is an abundant rainfall, and this will keep the sap active for a considerable time, but before the next notes are written hot, dry weather may prevail, and, if to a degree sufficient to rapidly dry the ground, or the bark of the stocks, measures must be taken to give them both a thorough soaking, and the ground a mulching of some kind a few days previous to inserting the buds. When budding, keep the ends of the shoots furnishing the scions in a can of water, and soak the bast or other tying material in water before using it. When binding the bud, take care to cover the incision thoroughly, but leave the bud itself free.

Roses that are planted out in houses must be given plenty of ventilation, and all ventilators and doors should be left open night and day. Withhold water at the roots entirely for a period of from six to eight weeks. Owing to the conditions under which the plants are grown, insect

be given water just sufficient to keep them from flagging until they are pruned. When they begin to break into growth, they should be re-potted into fresh soil. Now and onwards is a good time for persons intending to purchase Roses for autumn delivery to visit the Rose shows or large Rose nurseries. The Roses at the Temple Show formed a fine display. Amongst the best climbers were Minnehaha, Hiawatha, Kathleen, Waltham Rambler, and Dorothy Perkins. The new white Rambler Snowstorm and the Polyantha Mlle. Lavavasseur were also very effective varieties. Amongst H.P.s, Rev. D. R. Williamson and Dr. Gordon occupied high positions. There will be a good opportunity of purchasing later, at a reasonable price, strong plants of new and choice varieties in pots while the budding season is on. Each plant should have two or three well-ripened shoots that can be worked on the De la Griffierie or Manetti stocks during August: Teas

R. RUGOSA CALOCARPA.

THIS variety was raised by Bruant in 1894 from a cross made between *R. rugosa* with a variety of the Bengal Rose. The plant is an abundant bloomer, with pure rose-coloured blossoms, which are succeeded by an enormous crop of fruits which hang on the bush for a great length of time. It is admirably adapted for forming a hedge, or an ornamental specimen. *Rosen-Zeitung*, June, 1907.

ROSE MADAME PLANTIER.

OF all the newer varieties of climbing or pillar Roses, few surpass in beauty this old favourite, which is greatly admired for its pure white flowers. A reference to our illustration at fig. 4 will show better than we can describe the exceptional wealth of flowers which this Rose produces when afforded a position suitable to its requirements.

AMERICAN IRISES.

(Concluded from page 417.)

I. HARTWEGII.—This plant will challenge the cultivator's best skill and finally disappear. It is a very attractive plant, with slender leaves of a greyish tint produced in dense thickets. The flowers are 4 inches across, coloured pale yellow with lanceolate falls, horizontally poised. The standards are erect and nearly as large as the falls. The plant is capable of lingering for a few years in a pot under cool house treatment, but is quite an intractable plant in the open garden.

I. LACUSTRIS.—A small-flowered species, with broadly fan-shaped leaf clusters 6 inches high, and a succession of lilac-crested flowers that are somewhat smaller than *Iris cristata* but similarly coloured. It is pretty but very difficult to manage. It is essentially a rock plant.

I. LONGIPETALA.—This species and its variations afford a type of *Iris* that is equal to the best for cultivation in the flower border. The root-stock is a vigorous rhizome that branches freely. The leaves are 2 feet long, narrow, erect, and pointed at the tips. The flowers are borne in threes on slender, erect, rarely flexuose stems, and they are as elegant as they are beautiful. The fall petals are horizontally poised, broadly spatulate or lanceolate, and 6 inches long. The standards are shorter and narrower, and are erectly held, and the margins of both are undulating. The colour is mainly lilac, deeper as regards the standards, but the falls are paler and have a most elaborate veining of deep lilac over every part of the surfaces. There is a slight orange suffusion at the bend of the blade and some yellow down the claw. A very lovely species which must be seen to be fully appreciated.

The variety *montana* is smaller in all its parts, and the leaves are shorter. This plant is the *I. longipetala* of gardens, and the variety *superba*, also of gardens, is typical of *longipetala*. There are several forms in cultivation, but none is worthy of a distinct name. Ordinary soil and the treatment of common border plants suffices to keep this lovely *Iris* in good health.

I. MACROSIPHON.—A rare species of surpassing beauty and very variable. The leaf growth is that of *I. bracteata*, and the flowers differ only in their colour scheme and in the greater length of the falls. The stems average 9 inches in height; the flowers exceed 6 inches in diameter and vary in colour from pale to deep purple-violet in some varieties, and from lilac to buff-yellow in others. All have the characteristic long, drooping falls. It is a very difficult plant to grow successfully in a plant border, but would succeed wedged between stones on the rockery where ample drainage is possible. The variety *flava* is a pale yellow selection.

I. MISSOURIENSIS (I. TOLMIEANA).—This species is a useful and attractive plant of proved garden worth, and one that can be recommended for planting in borders. The leaves form glossy thickets, and are about 18 inches high. The flower-spikes just overtop these in early May, and produce a quantity of blooms agreeing in shape with those of *I. longipetala montana*. The falls are horizontally poised, and are coloured mainly with lilac. The general aspect of the flower is that of a poor, short-petalled bloom of *I. longipetala*, with a whitish signal patch in the paler varieties and yellow in the deeper-coloured forms. This species embraces at least 10 forms that differ considerably from each other; some are so close to certain types of *I. longipetala* that the only guide to their specific difference is their periods of flowering, which, in the case of *I. missouriensis*, is a fortnight the earlier.

I. TOLLONG is a hybrid between *I. missouriensis* and *I. longipetala*. Its flowers partake of the characters of the latter parent, but are smaller, more freely produced, and they precede *I. longipetala* in flowering by ten days.

I. PRISMATICA (I. GRACILIS).—For several years I had under cultivation a charming miniature *Iris* under this name. It has leaves just a foot high, slender, and very numerous. The flowers are coloured a clear violet as regards the falls, standards, and style branches, but the blade of the falls is contracted and coloured orange, lined with blue. *Iris graminea* is akin to this plant in habit and colour scheme, but whereas the leaves of *I. graminea* hide its flowers, the reverse is the case in *I. prismatica*, for the foliage is hidden by its flowers. A desire to increase this plant by division of the clumps proved disastrous, for the plants all died. It is a very charming *Iris*, not markedly showy individually, but the flowers are exquisitely formed and coloured.

I. PURDYI.—This is a vigorous plant of recent introduction, and one whose flowers resemble those of *I. versicolor* in shape, but are coloured a rich blue and are singularly true to colour. The leaves are slender, grass-like, erect, and are arranged in fan-shaped clusters of from 10 to 12. The stems exceed 1 foot in height, and bear several flowers each. The falls are coloured pale blue with violet margins, and a patch of white occurs at the bend of the blade. The standards are half the size of the falls, and the whole flower averages 4 inches in diameter. It is a very showy plant, easy of culture, and suitable for the plant border.

I. SETOSA (I. BRACHYCUSPIS), a native of Eastern Siberia, has one Canadian offshoot in its variety *canadensis*. The type plant has all the characters of the American group, and may fittingly be known and described with them. It has broad, deeply green leaves, produced in sturdy fan-shaped clusters; curious flexuose stems a foot high, that bear three to four flowers each, in which the standards are greatly reduced. The broadly spoon-shaped falls are drooping, and as large as a crown piece; they are coloured a rich wine purple, while the style branches have a purple-coloured median line on a greyish ground colour. The species grows well in any soil of good tilth, but it resents disturbance at its roots. The Canadian form has narrower falls, and the colour scheme is altogether paler, with a larger signal patch of white. I have not had the type from Canada.

I. TENAX.—Perhaps the most tractable, as it is the most beautiful, of all the American *Iris*es. The leaves grow in graceful tufts, and are 2 feet or more long. The rhizomes cross and recross in the manner of Twitch and take complete possession of the soil. The flowers are borne on slender and nearly straight stems, 2 feet long, and are coloured rosy-lilac, pale lilac, or silvery grey with lilac shading. The falls are sub-erect with recurving tips, and are generally one or two shades deeper in colour than the standards. The margins of all the petals are daintily waved, and there is a large signal patch of white elegantly veined with rosy-purple. This species is very variable in colour, but the form of the flower is practically the same in all. This *Iris* will grow well anywhere; the only soil it will not succeed in is one of wet clay.

I. TRIDENTATA (I. tricuspid, I. tripetala, I. Douglasii pygmaea, I. Hookeri).—A free-habited plant that grows well by the waterside or in some other damp spot. It has short tufts of deep green, and very broad leaves that are

practically evergreen. The flowers are produced in three's, from branching, well-leaved stems that just overtop the foliage, and they are coloured blue, with cloudy markings of purple on the falls. There are practically no standards, for these are reduced to tiny colourless processes. The blade is orbicular in shape, 2 inches across, and the bend of the blade and the claw is lined with purple, white, and yellow. The style branches are coloured pale amethystine-blue and they are much depressed. It is a floriferous, showy, and attractive plant, suitable for the flower border. *Iris Hookeri*, considered synonymous with *I. tridentata*, is a variety of the latter; the vegetative system of the variety is much stronger, and approaches in habit *Iris siberica orientalis*, but with no standards.

I. VERNA.—A very pretty plant that needs a marsh or a cool recess at the margin of a rock-pool for its accommodation. It has a running rhizome, greyish-green leaves and deep blue fragrant flowers, which measure about 4 inches high and possess a very remarkable throat of orange colour. It is one of the gems of the world's flora, and holds a position among grassy *Iris*es similar to that held by *Gentiana verna* among Alpine plants. It is an old plant, but still popular, and is likely to continue so as long as gardens exist.

I. VERSICOLOR.—A very variable species, whose flowers are not unknown to the English cottager. By a singular inversion of the circumstances, the variety *virginica* is recognised in gardens as the species, and *I. versicolor* is labelled as a variety of *virginica*. It is the commonest *Iris* of the New World, and extends over many of the States. The leaves are broad, handsome, and arranged in dense thickets; the flowers are produced just above the foliage on branched stems 2 feet high, each stem yielding a dozen or more flowers. These are coloured a rich wine-purple, shading to carmine at the bend of the blade, from whence a conspicuous shaft of white runs nearly to the tips. The erect standards are half the size of the falls, and they are coloured a pale claret-red. The style branches are white, suffused with pale purple. There are hundreds of forms; in fact, collected seeds yield almost as many varieties as plants: some are bad, many are good. A few have distinct names, but their seedlings may surpass them. The following are the best known varieties:—

I. V. VAR. VIRGINICA (CAURINA).—A purple-blue selection, with very large flowers: quite common in gardens.

I. V. VAR. KERMESINA.—A glorified form of the type: of a rich wine colour, heavily marked with white at the throat.

I. V. VAR. PULCHELLA.—A small habited plant, with deep violet-coloured flowers. All are free-growing plants that one can group by the waterside, in the flower border, or plant freely in the wild garden. They produce very beautiful flowers in plenty, but the easy-growing character of the plants has admitted of their being used in the most informal parts of the garden, where they are often compelled to battle with grasses for their living.

There is much to admire in American *Iris*es, and, although some are "weedy," and others difficult to manage successfully, those that are good and easy to cultivate give unlimited pleasure. Of all the *Iris*es it is my pleasure to know, those from America appeal to the artistic sense the most; they have not the stature of *Iris aurea* or *I. Monnieri*, neither have they the huge flowers of *I. laevigata*, but they have refinement, beauty of form, and artistic colour schemes that equal, if they do not surpass, any other *Iris*es in these respects. *George B. Mallett.*

LAYERING STRAWBERRIES FOR FORCING.

THE first essential for success in the forcing of Strawberries is to have strong, healthy runners, for which purpose it is advisable that a few rows of plants be grown in some open convenient position expressly for providing layers. I have for many years past forced large quantities of Strawberries, and have adopted various means for obtaining strong, thoroughly-matured crowns with more or less success. At Burghley, where the late Mr. R. Gilbert forced some thousands of plants annually, the plants were layered direct into small pots that were filled with good loam to within half an inch of their rims. The plants were afterwards transferred to 32-pots, and this was done as early in the season as possible. The results were excellent, and the practice is a common one with many growers of early Strawberries. At Longford, where Strawberries are also extensively forced, I found the runners were layered direct into their fruiting pots, and this system furnished equally good results. I have repeatedly tried the two methods, and have found that the latter system saves much labour and gives equally good plants, which thus receive no check after they have been pegged to the soil.

Last season my plants had exceptionally plump and firm crowns. They were runners from a bed in which the rows were 3 feet apart, the plants being placed 1 foot apart in the rows. The flower trusses were removed as they appeared, and the stolons were pegged direct in the fruiting pots, which were well provided with drainage and filled to within half an inch of their rims with a moderately moist and suitable compost, pressed firm. The young plants grew rapidly, and soon filled the pots with strong, healthy roots, and by the end of the season they had formed fine crowns which showed no signs of mildew, nor were the leaves spotted by disease. By the first week in July I hope to have a goodly number of our current season's plants layered, and, as far as possible, these will be layered in their fruiting pots. The pots and well-drained, and the soil should consist of a mixture of moderately heavy loam, wood ashes, a little decayed manure, and a sprinkling of soot. When filling the pots, the soil should be made firm. After the plants have formed sufficient roots they should be severed from their parents, and be stood on a layer of cool ashes in a position where the sun can reach them. During dry weather ample water, with an occasional application of liquid manure, should be supplied the roots, and the foliage should be lightly syringed. All runners and weeds should be kept in check. The variety Royal Sovereign forms the bulk of our crop, for although other varieties have been tried here, this kind, all points considered, suits us the best. *H. Markham, Wrotham Park, Barnet.*

NOTICES OF BOOKS.

FRUIT RECIPES.*

IN this comprehensive work the reader finds in condensed form almost everything that the cook, housewife, and, to some degree, the manufacturer of preserved fruit products, needs to know in reference to the preparation of fruit for the table—as sauces, jams, preserves, jellies, marmalade, pies, tarts, puddings, creams, soufflés, pickled, brandied, and spiced; as wine, chutney, as vinegar, and the thousand and one ways in which civilised mankind prepares fruit for consumption.

* By Riley M. Fletcher-Berry, The Orchard of Palms, Orlando, Florida, U.S.A. Published by Messrs. Archibald Constable & Co., Ltd., London; 4to., 340 pp. Price 7s. 6d. net. Illustrated.

Not alone do the fruits of temperate climates come under notice, but also those of the hottest parts of the world in regard to their preparation as food and table delicacies. The author also relates their contents in potash salts, proteids, carbohydrates, including sugar and starches, phosphates, acids, and water, and their uses in the economy of the human body in health and disease.

The author states in the preface that "Each fruit has a special, and some of the general values; some of them meant only as accessories to other foods, as a rule stimulants and purifiers, containing chiefly the carbohydrates, and must be balanced by fats, nitrogen, or protein, and fruits containing more cellulose. Some fruits require very little 'balancing,' being substantial and nearly perfect in themselves, as Figs, Prunes, and the Cocoonut, which last, when fresh, should be ranked rather with fruits than nuts. Of such are the Banana and the Persimmon, the Grape and the Apple." "Facts concerning the values of fruits have been widely scattered, hidden behind masses of figures, or buried in scientific works. Most of my recipes are original or long since adopted and adapted by family habit or traditions of cooking of friends Scotch, English, German, and American." The usefulness of the work cannot be over-estimated, "for the results of these investigations reach people who might never be reached in any other way, and yet influence those who have every other opportunity and scientific authority at hand, helping to simplify everyday affairs."

Most of the recipes are such as apply to American fruits or to those exotic ones that can be successfully cultivated in America. We may mention a few of the more important fruits of which recipes for preparation for the table are given, viz., Peaches (including the curious Chinese Peen-to), Pineapples, Persimmons, Mangosteen, Sapodilla, Californian Olives, Prunes, Tamarind, Stringy Mango, Northern Papaw, Loquat, Pomegranate, Apple, Pear, Quince, Currant, and Cherries. The Citrus genus is, perhaps, treated most comprehensively.

At the end of the volume are found Remington's Analyses of Fruits, also those of Wood and Bache, and several others. The book is provided with a copious index.

FLOWER DECORATION IN THE HOUSE.*

THIS book would be useful, if only for its charming illustrations of vase bouquets made of very varied materials, and which, to the number of 57, are distributed throughout its pages. It occurs to the reader that the authoress, in her distaste for the formal and the regular in arranging flowers and foliage, has adopted the fanciful methods of the Japanese, who excel in the arrangement of floral decorations in the house and in the garden. It may be hoped that these methods, with modifications, will at no distant date displace the old-fashioned style in our country. We want that which is elegant and artistic, but which, unlike the styles in vogue on the Continent, will be free from the ribbons, mirrors, and other fantastic accessories so common in some forms of decoration. The book contains descriptive matter abounding in judicious remarks that show an intimate acquaintance with the subject, and a wide knowledge of plants; of harmonies in colour and form; and of the uses of foliage and of berried plants. Many valuable hints are given, as, for instance, "no Hellebore leaves should be cut off until they are quite brown". . . "but it is a good plan to have a reserve of the wild Hellebore (*H. foetidus*) grown for the purpose of

* By Gertrude Jekyll. Published by "Country Life," Ltd., 21, Tavistock Street, Covent Garden, W.C., and George Newnes, Ltd., 3-12, Southampton Street, Covent Garden, W.C.; 98pp., quarto; price, 6s. net.

providing leaves." And, further, Christmas Roses are said to be "handsome with leaves of the Megaseas, the best of these being those of the cordifolia section." An effective illustration is one showing a vase filled lightly with Christmas Roses (*Helleborus niger*), *Pernettya* shoots loaded with berries, and *Viburnum tinus*, together with light fronds of the hardy Fern *Scolopendrium vulgare*, the Fern fronds being arranged fanwise. Among other hardy subjects, the Sweet Bay (*Laurus nobilis*), about the leaves of which the authoress is eloquent, also those of *Arbutus*, not forgetting its fruit, so useful in the winter bouquet; the evergreen Oak, whose leaves are at their best in winter, and which associate well with white *Narcissus* blooms at that season are mentioned.

For the months of January and February, we are bidden to remember the fragrant blossoms of the Winter Sweet (*Chimonanthus fragrans*). In March, attention is drawn to Lenten Roses—garden varieties of *Helleborus atro-rubens*, *H. colchicus*, *H. olympicus*, and *H. orientalis*. The colours of their flowers are not bright, but they appeal to the artist's sense of colour, and they interest and please. We are told that the stalk-ends should be "slit up about 2 inches, the better to imbibe water," as, should the stalks of wild Arum leaves. It may be said here that some white *Richardia* spathes, placed among, and ranging high above the leaves of wild Arum, form an effective illustration. Among the many handsome plants blooming in March, *Magnolia conspicua* and *Prunus Pissardi* are mentioned. The purplish red leaves of *P. Pissardi* have several uses in decorative work, and the shoots should be cut and placed in water in a warm greenhouse, where the leaf-buds will open prettily, and become ready for use in the house. Prunings of the Peach can be treated in the same manner some weeks earlier.

In this fashion the reader is taken through the entire year, so that the uses and the beauties of numerous species of plants are commented upon, and many of them shown in vases, basins, &c. In June are shown Iris blooms set off with the leaves of the Globe Artichoke, and apparently with good effects.

The Rose is naturally referred to at considerable length in July, and a variety of methods described for displaying the blooms in mixtures with other flowers or by themselves. The Rambler Roses, the Polyantha varieties, and single-flowered species as *Rosa macrantha*, are also mentioned.

Miss Jekyll's idea of showing Hybrid Perpetual Roses in a shallow bowl of water is the best that can be adopted. The flower-stalks must be cut short, and some contrivance is necessary for holding up the blooms. Those persons who rightly set high value on floral decorations in the home will not err in obtaining this valuable volume for study.

MARKET GARDENING ON LONG ISLAND.—The market gardens of the towns of Newtown, Jamaica, Hempstead, and Oyster Bay, on Long Island, have for years played an important part in supplying the Manhattan and Brooklyn markets with early Potatoes, Cabbages, Peas, Sweet-corn, Beans, Tomatos, Asparagus, Onions, Rhubarb, Beets, &c. The fertile townships of Southold, Riverhead, and the Hamptons on this island still hold their pre-eminence as the finest market gardens in the U.S.A., and an average per year of not fewer than 2,500,000 bushels of Potatoes, and 200,000 barrels of Cauliflower, 40,000 bushels of Lima Beans, tens of thousands of bundles of Asparagus, large quantities of Onions, and other vegetables; 200 to 300 tons of seeds, such as Cabbage, Cauliflower, Tomatos, &c., are sent to the New York City and New England markets. *H. J. J. Review.*

COLONIAL NOTES.

MORAEA IRIDIROIDES.

In the *Gardeners' Chronicle* for May 11, just to hand, I notice an article on *Moraea iridioides* (Linn.), and of its so-called improved variety. It may be of some interest to your readers to know more of this variety. In 1881 I was living in Inanda, 20 miles from Durban, and about 2,000 feet above sea level, I knew *Moraea iridioides* quite well, and in that year, or in the previous one, I found what I took to be a new species, the leaves and flowering stems being much longer, the habit different, and the flowers larger and more brightly coloured. I sent a dried specimen to Kew, and it appears in the *Flora Capensis* as my No. 1099. In February, 1882, I left Inanda to take charge of these gardens, bringing a plant of the *Moraea* with me. This plant and seedlings from it have been growing here for more than 25 years; they have had no special attention and have scarcely been manured. The oldest, if not the original, clump is now 3 to 4 feet in diameter, the leaves and flowering stems more than 3 feet long and quite erect. During most of the season flowers are borne in abundance, and a dried flower which I have just measured is 4 inches in diameter; the colour is as described in the article by Mrs. Richmond. Seeds of this plant have been distributed to all our correspondents—that is to most, if not all, of the leading Botanic Gardens in the Empire and elsewhere. The plants are not now in bloom as it is mid-winter here, but when flowers are obtainable, I will have a coloured drawing of one of them made natural size which shall be forwarded to the Editor. J. Medley Wood, Director, Natal Botanic Gardens. [We shall be pleased to receive the drawing.—Ed.]

The Week's Work.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq., Cobham Park, Surrey.

Tomatos.—Plants which were set out at the foot of walls in the latter end of May, and in the open garden early last month, having made new growth, will now require further tying, and to have the side shoots pinched out, keeping the plants as single cordons. Take every care to prevent the roots suffering from drought, especially those plants growing against walls, in positions that do not always get the full benefit of the rains. Where ripe Tomatos are required early in the year, seed should now be sown of any approved varieties of similar type to Winter Beauty. Shardlow and Sunrise may also be safely recommended. Sunrise, although not ripening quite so early, has free-setting qualities even during the dull days of winter. The flesh of the fruits is firm and of deep colour, just as in mid-summer.

Turnips.—As Turnip crops are soon over after they become ready for use, especially during the early part of the summer and on light soils, seeds must, therefore, be sown frequently and in small quantities. During July and the early part of August, however, seeds should be sown in greater variety and in larger quantities, because from these sowings the autumn and winter supplies will be obtained.

French Beans.—Varieties such as Canadian Wonder, also the Dwarf Butter Bean, may be sown on a warm border, or a position where it will be possible to afford them protection at night in the autumn. Plants from this sowing will yield supplies late in the season, when those in exposed situations have been cut off by early frosts.

Salads.—Seeds of Lettuce and other summer salads should be sown at this season on a north border; this position is particularly necessary if the soil of the garden is of a light and sandy nature. Sow the seeds at regular intervals in small quantities. Watering of such crops must not be neglected if the weather is dry, but if the ground was liberally supplied with manure, watering may not be required.

Clipping of hedges.—Now that the season's growth is nearly finished, the work of clipping hedges may be commenced. All the rubbish and weeds that may have accumulated should be removed, and burnt. If the box edgings were not clipped during the past month, this work should be proceeded with at once.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Coleus thyrsoides.—The young plants intended for winter-flowering should now be given a final shift, using receptacles of a size suitable for the purpose in view. A compost of two parts turfy-loam and one part leaf-soil and sand should be used as a potting medium. Do not continue the pinching of the shoots too late in the season, for this will cause the flower-spikes to be small. When the plants are established in their new pots increase the amount of ventilation to promote a robust growth, and do not crowd the plants together, but leave plenty of room between them, for their tissue is of a soft nature and easily becomes drawn and weak.

Moschosma riparium.—Plants required for decorative purposes in winter should also be repotted into their flowering-pots without delay, and after they have recovered from the disturbance at their roots, they may be placed out-of-doors for the next two or three months, but they must be placed in the plant house again before the cold weather or heavy autumnal rains set in.

Liliums.—As the earlier flowering batches of these plants come into bloom, they should be moved from the house in which they have been gently forced, to a cool and shaded house or conservatory, where the blooms will last in a good condition much longer than in a close and warm atmosphere. Any further top-dressings necessary for plants of later batches should now be applied and a stake afforded each plant as required. A selection of the latest plants should be placed out-of-doors in a position sheltered from strong winds. These will furnish flowers late in the autumn. Of the various forms of *Lilium auratum*, L. a. *Alexandrae* and L. a. *platyphyllum* are to be recommended. L. *speciosum* (*lancifolium*) has also several good garden varieties, of which the best are L. s. *album Krætzleri* and L. s. *Melpomene*.

Azalea indica.—Plants that were forced early into flower, and which were replaced in heat to complete their growths, have now matured their buds sufficiently to allow the plants to be gradually hardened and placed out-of-doors. It is possible, select a position that is partially shaded during the hottest parts of the day. Plunge the pots in ashes to keep the roots at an equable temperature and to prevent them from drying quickly. See that the soil is neither in a condition of extreme wetness nor excessively dry. If, by misadventure, a plant becomes quite dry, immerse the pot in water and stand the plant in the shade for a time. Syringe the plants thoroughly every fine evening, using occasionally some clear, diluted soot water. This will serve to ward off thrips and other insect pests, and will also furnish a manurial stimulant to the roots.

Hard-wooded plants such as *Acacias*, *Ericas*, *Epacris*, *Libonias*, and *Camellias* in pots and tubs, are all benefited by being placed in the open at this season of the year. Their foliage can be more readily cleansed when out-of-doors, and the plants are usually much harder and healthier when the time comes round for housing them again in September.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Calanthes.—The deciduous species are now making active growth. Extra care in watering is necessary for these plants that are not yet well-established, particularly those of the C. *Regnieri* section. So long as the weather continues dull, even the best rooted plants must be watered with discretion, as the compost will not dry through so quickly as it otherwise would, and if kept in a saturated condition, without sunshine, the bulbs and leaves will probably become spotted. It is a good plan to look over the plants occasionally, and place the best rooted examples together, giving them sufficient room so that plenty of light may reach to the base of each growth. Where a number of young roots appear on the surface of the compost, a thin layer of fibrous loam may be placed lightly over them, into which the roots will quickly penetrate. In preparing the loam it should be broken up into small lumps, and then have most of the fine soil removed by sifting it through a fine-meshed sieve. Keep the plants as near to the roof glass as is convenient, in order to

obtain stout bulbs and strong flower-spikes, and as the season advances, gradually accustom the most forward plants to a greater degree of light. Very little syringing or damping between the pots need be done until the weather is brighter.

Pleiones.—These are suspended well up to the light in the intermediate house, and are in full growth. If the plants are vigorous, they should be watered abundantly at the root till the foliage shows the colours of maturity, when the quantity of water should be gradually lessened. P. *humilis* and P. *Hookeræ* grow best when suspended close to a roof ventilator in the cool house; these must also be afforded enough water to keep them wet.

In the *Odontoglossum house* such charming plants as *Cochlidia Noezliana*, C. *vulcanica*, C. *sanguinea*, and C. *stricta* do best when suspended well up to the light in shallow pans, and during their period of growth require plenty of water at the root. At the re-commencement of growth the plants may be re-potted, using thorough drainage, and a mixture of peat and sphagnum-moss in equal parts, pressing this moderately firm around the plants. The dwarf growing *Promenæa citrina*, also P. *stapelioides*, and P. *Rollissonii* will succeed under similar treatment. *Aërides japonicum* and *Angræcum falcatum* should be grown in small teak baskets, providing crocks and sphagnum-moss for them to root into. Suspend the plants in a shady part of the cool house, and keep the roots moderately moist at all times. The flower-spike of the *Aërides* hangs down outside the basket, and emits a sweet, delicate odour; the pure white flowers of the *Angræcum* are also deliciously scented.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Lawns.—The weather has been very favourable to the growth of the seedling grasses on new lawns. Notwithstanding the exercise of every care in the harvesting of seed, many weeds always come up with the grasses. The presence of small-growing, annual weeds is immaterial, but all the perennial weeds must now be carefully removed. This being done, roll the lawn with a roller of medium weight, and after the elapse of a few days cut the grass with a very sharp scythe. When the grass roots have obtained a good hold of the soil, future mowings may be done with the lawn-mower, provided it is in good order, but the knives must not be set to cut so low as is customary for mowing old-established lawns.

Vases.—The plants growing in vases are more likely to suffer from lack of moisture at the roots during showery weather than when the atmosphere is dry, and watering is therefore done at regular intervals. The foliage of the plants throws off the greater proportion of the rain, and, unless the rainfall is very heavy, only enough to moisten the surface of the soil will enter the vases. It is necessary to make sure that the whole of the soil is sufficiently moist for the plants' well-being. Most vase-plants will now require some manurial assistance. It is a good plan to feed them with artificial manure and diluted animal liquid alternately; when using the latter rinse the outsides of the vases with clear water immediately after the manure has been applied.

Early *Chrysanthemums.*—All the weak shoots should be removed so as to allow sufficient room for the stronger ones to develop properly. Place neat stakes to the plants, and tie them up as they grow. Neglect in this particular often means ruin to the plants when sudden winds spring up. Frequently hoe between the plants.

Campanula pyramidalis.—The seedlings which were recently pricked off will require another shift. After they have recovered from the check thus caused, transfer the boxes containing them to cooler quarters. A position in the nursery garden should be prepared for them, as they will soon be large enough to plant out of doors. The flower-spikes of the older plants may now require longer stakes.

Humea elegans.—Seeds may now be sown in boxes of fine soil and placed in a cool pit. As the seedlings germinate, they should be potted in small pots and kept in the pit. Towards the end of the autumn, let the young plants be brought into a cool house. Abundance of fresh air and careful watering are most essential in the cultivation of these plants.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq.,
Norwood, Alloa, Clackmannanshire.

Fruit trees in pots, including Plums, Cherries, Nectarines, &c., which were started in an early Peach house, will now be cleared of their fruits. The trees should be placed in a cooler house to harden them before placing them out-of-doors, where they should be plunged to the pot rims in coal ashes in a fairly open position, but one that is sheltered from strong winds. Never allow them to suffer from want of moisture at their roots; syringe the foliage occasionally to keep the plants clean and healthy. Give liquid manure occasionally to assist in building up strong wood and buds, from which next year's crop will be derived.

Later fruiting trees in pots, such as Apples and Pears, will require especial care in the matter of watering, and generally they will require watering at their roots twice daily, for on no account must the leaves be allowed to flag. Give manure water once a week, syringe the foliage daily, and fumigate the house in which they are growing occasionally. Tie up any branches carrying fruits, and do not overtax the plant by permitting a heavy crop. Afford an abundance of ventilation by leaving the ventilators open both day and night.

Melons.—Plants on which the fruits are swelling must be given an abundant supply of tepid water at their roots to prevent the foliage flagging. The water should never be applied close to the "collar" of the plants, but 6 inches distant from the stems. Water about the "neck" of the plants is often the cause of the dreaded canker and corking diseases that are so troublesome to many growers. Maintain a good bottom heat at nighttime, and especially after the borders have been well watered. Support the fruits to the trellis by suitable ties, and remove any of the young growths that are not required, but allow a few superfluous shoots to grow at the top of the plant to encourage root action. Admit air by the top ventilator only, and keep the house moist, but as soon as the fruits begin to develop colour, air may be admitted by both the top and the bottom ventilators, maintaining a dry atmosphere at a temperature of 85° by day and 70° at night.

Late Melons.—As soon as the fruits are cut from the early-fruiting plants, another batch of plants can be accommodated in the same pit for fruiting in September. The young plants should be in readiness and well rooted in 6-inch pots. It is best to entirely remove all the old soil and to cleanse the house thoroughly, using a mixture of one ounce of soft soap and one wineglassful of paraffin in a pail of hot water, thoroughly mixed before using. Make up the borders very firm with the new soil as previously advised, and place it in the form of a ridge. Plant the Melons 18 inches apart on the ridge, stake and tie them, and when all is finished give a good watering with tepid water. Keep the atmosphere of the house close and damp, and spray the plants overhead both morning and evening. Admit a little air at nighttime to prevent the plants becoming drawn during hot weather.

PUBLIC PARKS AND GARDENS.

By W. W. PLETIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Notice boards are unfortunately a prominent feature in most of our public parks, as printed notices are often needed to direct visitors to various parts of the grounds and to warn them against the infringement of the by-laws. Few objects in a park give occasion for so much adverse criticism as do the usual inartistic type of notice boards with their monotonous reminders. The appearance of an entrance to many a pleasure ground is greatly marred by the number of different notices exhibited at it. Even these do not appear to be enough for the purpose, as one can scarcely get away from notices of some kind or another in any part of a park. While park officials are generally aware of the fact that these boards do not add to the beauty of their surroundings and do their best to limit the number of them, they know too well that notices are essential for the protection of park property and the maintenance of proper order and conduct among certain classes of visitors. The stereotyped notice "Visitors are warned that they must not pluck the flowers in the park" may appear to be an absurd and needless warning to

place in any public garden, yet it is the one most frequently required. Well-educated and apparently intelligent women are frequently detected stealing flowers and plants in parks in every part of the country, and when questioned invariably declare that they did not think they were doing any harm. The absence of notices is one of the first excuses a culprit makes use of when caught infringing a by-law.

Notice of by-laws.—The notice which invariably occupies the most prominent position at the main entrance to a park is a large copy of the general by-laws. As this contains so much reading matter it is quite impracticable to have it inscribed upon zinc or linoleum by a sign writer, so it has to be printed on paper and afterwards pasted upon the board.

Printed notices.—The fact of these notices being printed on paper makes it difficult to maintain them in a clean and readable condition. We have tried all kinds of methods of dealing with them, but the result has always been the same. Although the paper is sized and coated with the best outside oak varnish, they are in use for a few months only before they become unsightly and require replacing. The humidity of our climate seems to have a very bad effect on the paper used for printing purposes. We have tried zinc sheets between the paper and the wood of the notice board, and have also used a covering of glass, but all to no purpose; and we have at last been compelled to adopt what, I believe, is a common practice of having a duplicate set of boards always in readiness to take the place of others as they become unrepresentable. Whoever may discover a cheap method of treating paper in such a manner that it can be kept in good condition in the open air for any lengthened period will undoubtedly earn the gratitude of everyone who has to deal with this question.

Ordinary park notices can now be had ready printed on enamelled iron plates, and they are very much neater and cleaner in appearance than the old wooden ones. So long as the enamelled surface does not chip, these plates last for years without so much as needing a coat of varnish. With the exception of these and the by-laws, the notices generally required in a park can be printed by an ordinary painter with the aid of stencil plates. It may seem paradoxical to say so, but it is well to have notices as unobtrusive as possible. Dark coloured boards—say, black or dark green—with white lettering are preferable to those painted white with dark lettering.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton,
East Devon.

Ripening fruits must be protected from the birds, or they will destroy a large portion of the crops of Currants, Gooseberries, Cherries, &c. The Strawberry crop is maturing very slowly, and many of the fruits have rotted on the ground. No Strawberry plantation should be retained after the fourth season of cropping. The most satisfactory method of renewing the Strawberry beds is to plant a given number of rows each year, and destroy a similar number of the old ones as soon as the fruits are harvested. In netting fruit trees on walls, forked sticks placed at convenient distances and about 6 inches in length will keep the net away from the face of the wall. Place the forked end of the stick outwards to hold the net in position.

The fruit room should have a thorough cleansing. Limewash the walls and scrub the woodwork with soapy water. Keep the structure fully ventilated, so that all may be sweet and clean by the time the first fruits are gathered.

General observations.—Now that the superfluous lateral growths have been shortened on trained trees, one can the better estimate the amount of the crop on each tree, and manurial aid can be given accordingly, feeding only those that are carrying fair crops of fruit. A second thinning of the fruits is necessary in the case of some varieties of Plums and Apples, and, in a few instances, of Pears: this should be done without delay, as extra fruits cause an unnecessary strain upon the tree. There has been no great amount of heat to dry the soil, except in the case of trees occupying warm sites against walls, and the need for mulchings has therefore not been

great; but mulching has this advantage in wet weather, the manurial properties get washed down to the roots of the trees. The rains have lessened the labour of syringing the foliage compared with that of last season, but what has been saved in this direction is more than lost in the constant use of the hoe and rake necessary for the removal of weeds.

Grapes out-of-doors.—One sometimes meets with a vine in the open that is carrying a fair number of bunches. To thoroughly ripen these a warm summer is essential, and it is necessary to thin the berries and set aside any leaves that unduly shade the bunches. Keep all subsequent growths pinched at the first joint; secure each shoot to the trellis, and assist the roots with a stimulant when watering is found to be necessary. In a season like the present one mildew causes much damage: on its first appearance dust the foliage and fruits with flowers of sulphur, which can be removed again by syringing 24 hours after its application. It may also be added dryness at the roots is a frequent cause of mildew, so that extremes either way favour the spread of the fungus.

THE APIARY.

By CHLOIS.

The busiest season of the year is now with us. The supers have been placed on the hives, and these will need close attention. When the sections or shallow frames are about two-thirds full another set must be placed below the first super, as a delay in this respect will cause the bees to swarm. This process is termed "tiering." It is best performed about midday, when the bees are abroad gathering nectar, for there will then be fewer bees to disturb at home. Care must be taken not to spill the honey when moving the frames, for carelessness in this respect may be an incentive to robbing.

Preparation for swarming.—Hives should be fitted up to receive swarms, if the beekeeper be desirous of extending his apiary. The frames in the brood chamber should be fitted with "starters," that is a strip of comb about an inch or so in depth. Too much care cannot be taken in making these "starters" secure in the top bar. Failure in this respect may cause the whole to slip later, and then the bees will build comb in all directions. Sections fitted with full sheets of foundation, or, better still, shallow frames with drawn-out comb, should be put in the hives, for by these means all the honey will be readily harvested by the beekeeper, and the practice will leave plenty of space at the bottom parts of the hive for brood-rearing. Bees in their first season rarely build drone comb. They always fill themselves with honey before swarming, and this they convert into wax, for in a condition of nature, they commence house-keeping in an empty space such as a hollow tree. Further, when no full sheets of foundation are placed in the brood chamber the bees are practically compelled to store in the supers.

To prevent swarming.—Some time ago an experimental friend of mine placed an extra brood chamber below the one in use in a hive, took out the queen from the frames above and placed her on the added frames, and prevented her from returning by a sheet of "queen excluder." As the brood hatched out of the old brood frames the bees filled them with honey. A stronger colony it would be hard to imagine, but the queen was a good one, and in her second season.

Artificial increase of stocks.—Those persons who are desirous of increasing their stocks artificially may do so with every reasonable hope of success. The present time is the most successful for queen-rearing.

Casts.—It is useless to keep "casts." Take out the queen or queens (for casts often contain several queens, I have seen as many as five) and destroy them if they are not required, and place the workers in the hives from which the bees issued.

Extractor.—See that the extractor is cleaned, fitted up and in perfect order so that no time may be lost in emptying the shallow frames when they are full.

No honey should be extracted from combs which are not sealed, because the honey under these conditions is watery, and has not that full flavour which is found in fully ripened, that is, sealed, honey.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER, 41, Wellington Street, Covent Garden, W.C.**

Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR, 41, Wellington Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 6—

Soc. Franç. d'Hort. de Londres meet.
German Gard. Soc. meet.

TUESDAY, JULY 9—

Roy. Hort. Soc. Summer Exh. at Holland Park (2 days).
Wolverhampton Fl. Fête (3 days).
Roy. Scottish Arbor. Soc. Exh. in Edinburgh (4 days).
Cambridge Fl. Sh.

WEDNESDAY, JULY 10—

Tunbridge Wells Fl. Sh.
Croydon Fl. Sh.
Brixton, Streatham and Clapham Hort. Soc. Sh. (provisional).
Bath Rose Sh. (2 days).
Southend-on-Sea Fl. Sh.
Newcastle-upon-Tyne Fl. Sh. (3 days).
Lee, Blackheath & District Fl. Sh. (2 days).
Hereford & West of England Rose Sh.

THURSDAY, JULY 11—

Addlestone, Chertsey and Ottershaw Fl. Sh.
Potters Bar & District Rose Sh.

SATURDAY, JULY 13—Woodbridge Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.3°.

ACTUAL TEMPERATURES:—

LONDON:—Wednesday, July 3 (6 P.M.): Max. 58°, Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 4 (10 A.M.): Bar., 29.6; Temp., 59°; Weather—Overcast.

PROVINCES:—Wednesday, July 3 (6 P.M.): Max. 57°, Oxford; Min. 52°, Ireland W. coast.

SALES FOR THE ENSUING WEEK.

WEDNESDAY, THURSDAY AND FRIDAY—

First portion of the "Woodlands" collection of Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Gardeners' Benevolent.

As we were able to announce in our last issue, the Gardeners' Royal Benevolent Institution has this year raised a sum of nearly £2,500 by means of the annual festival dinner. It being the first occasion on which the event has been so successful there is every reason for congratulation, although the circumstances are not so favourable as to warrant a feeling of entire satisfaction. This would only be possible if the Executive Committee were placed in such a position that it could safely advise the subscribers to elect as pensioners all deserving candidates who have applied for relief. That this is not the case at present was very clearly demonstrated by the honorary treasurer and chairman, Mr. Harry J. Veitch, whose excellent speech contained statistics and information that clearly affected the feelings of those present.

The Hon. Walter Rothschild, M.P., who presided at the dinner, made a sympathetic speech, in which he remarked upon the duty of garden proprietors, to help this

Institution in making some provision for those gardeners who in their declining years may need assistance. The study of flowers and fruits, he said, conduces to some of the most charming amenities of life, and in such studies, as also in the enjoyment of the products of the garden, the gardeners were their willing and enthusiastic ministers. Having related that the Institution was established in 1838, Mr. Rothschild said since that year it had distributed a sum of £113,000. There are now 227 persons receiving permanent relief, and, in addition, considerable sums are distributed each year by the Victoria Era and the Samaritan Funds. All the expenses of management are defrayed by the dividends and interests arising from the invested funds. Mr. Rothschild thought it very satisfactory that so large a sum as £1,500 is raised annually from subscribers, but, notwithstanding this fact, there remains a sum of £2,500 to be raised each year by other means. Similar societies are more numerous than formerly, and it is not found that the number of supporters of such charities increases in equal proportion, but, said Mr. Rothschild, he earnestly hoped that the 29 candidates now before the Committee would not be allowed to wait for longer than candidates had done in former years.

In responding for the Institution, Mr. Harry J. Veitch stated some particulars that ought to be made known to all gardeners who at the present time can afford to support this charity, but who may in future years need assistance from its funds. In the first place, however, he thanked the chairman for his presence there that evening, and for the help he had afforded the Institution, remarking that the Hon. Walter Rothschild was the fifth member of the family who had attended the annual festivals. Proceeding to speak of the Institution, Mr. Veitch said he had been intimately connected with it for more than twenty years, and he could assure his hearers that it is doing excellent work. At the commencement there were only two pensioners, now there are 227 receiving permanent relief, including 126 men and 101 women. The oldest pensioner is a woman aged 95 years, who was elected on to the funds in 1885, in succession to her husband, who had paid £35 to the Institution in annual subscriptions. Husband and wife together have received relief amounting to £395. The pensioner who has been longest on the books is also a woman, and her age is 89 years. Her husband had previously been helped to the extent of £304, and the widow herself has received £344, making a total of £648. The two widows mentioned are still drawing their pensions. At the election in January last, 20 pensioners were elected, their average age being 70 years, and among these were several candidates who had been in good circumstances, proving, as Mr. Veitch remarked, that poverty affects all classes, and it is frequently caused by circumstances over which those who suffer the consequences have little control. The Institution does not, as a rule, afford permanent relief to candidates under 60 years of age, but exceptions are made in specially necessitous instances; thus, in one case, a pensioner who is 54 years of age is suffering from paralysis, and another 55 years is totally blind.

That the help afforded the pensioners is appreciated by the recipients, Mr. Veitch showed, by reading, as he has on many former occasions, a few extracts from letters received by the Committee from those at present enjoying relief. Nothing could be more conclusive than the evidence thus afforded of the amount of misery and want that is ameliorated by the pensions from the Institution, the details so disclosed being sufficiently pathetic to affect all who are not callously indifferent to the sufferings of others. After reference had been made to the continued benevolence of Mr. N. N. Sherwood and other friends, and to the excellent work which is done by the local auxiliaries, Mr. Veitch, referring to the future, pointed out that there are now 30 candidates awaiting election, and that the Committee had never yet been able to elect more than 20 pensioners at one time. If these 30 cases were placed on the funds, it would involve an annual expenditure of £588, and it must be further noted that the Institution would incur an obligation for the remainder of each candidate's life. It is impossible for the Committee to undertake this responsibility at present, and it is feared there will be many disappointed candidates at the election in 1908 unless the income of the Institution can, in the meantime, be increased to a considerable extent. As showing how much easier the lives of the pensioners become when they are partially relieved of anxiety concerning the necessities of existence, Mr. Veitch said that one pensioner, when elected, was over 70 years of age, and his medical attendant had stated that it was impossible for him to live for many months, yet he lived to the age of 103 years. The pensioners have, on many occasions, shown that they are perfectly honest in the acceptance of help, one of them having actually contributed towards the funds when circumstances had again placed him in a more favourable position. Only last year a pensioner wrote to the Committee renouncing the pension, because he thought that his circumstances were no longer so necessitous as those of some candidates still awaiting relief. Mr. Veitch closed a most effective speech with the exhortation, "Let us leave an example that those who must fill our places sooner or later may emulate—and surpass."

Mr. Stuart M. Samuel, M.P., proposed the toast of "Horticulture in all its Branches," making a humorous speech, to which the Right Hon. Colonel Lockwood, M.P., responded.

The Secretary, Mr. G. J. Ingram, subsequently announced the donations and subscriptions. These included, amongst others, an annual subscription of five guineas from H.R.H. the Prince of Wales, 100 guineas from the Chairman, 100 guineas from Messrs. N. N. Rothschild and Sons, £225 from Norman C. Cookson, Esq., £225 from Messrs. Sander and Sons, £200 from Messrs. Sutton and Sons (also £50 to the Samaritan Fund); from the friends connected with Covent Garden, etc., per Mr. Geo. Monro's list, £137 11s., and Mr. R. F. Felton's list £120.

It is encouraging to know that so deserving an Institution has such good friends, many of whom come forward year after year and afford help to the utmost limit of their power.

Photo by E. J. Wallis.

ROSE-TIME AT KEW.

OUR SUPPLEMENTARY ILLUSTRATION depicts a portion of the Rose Garden near to the Palm House in the Royal Gardens, Kew. The variety in the foreground of the illustration is Dupuy Jamain, a vigorous Hybrid Perpetual Rose, having rich, cerise-coloured flowers. Next is a bed of standard plants of the variety Baroness Rothschild, a rose-coloured flower shaded with white. The large round bed near which an artist is seated contains the Hybrid Tea variety Caroline Testout, which is considered by many cultivators to be the finest Rose ever raised. Caroline Testout is a Rose that may always be seen at exhibitions of this flower, and as a garden Rose it has few equals. The other round bed in the distance contains Mildred Grant, a variety remarkable for the large size of its flowers; these are blush-white, tinted with pink. At Kew it is the practice to plant Violas to carpet the Rose beds during the first year after the Roses are planted, and occasionally the Violas are repeated in the second year. The third and fifth beds on the left in the illustration are planted in this manner. When Violas are thus employed it is necessary to study the colours of the flowers of both the Rose and Viola for each particular bed, and in some instances the young foliage of the Rose has to be borne in mind. One of the best effects this spring was obtained by growing Viola Duchess of Sutherland, lavender blue flowers, as a groundwork to the Rose Marianne Pfitzer, the young foliage of which has a decided bronze tint.

THE HOLLAND PARK SHOW.—The Royal Horticultural Society will hold its summer show in the park adjoining Holland House, Kensington, on Tuesday and Wednesday next. The Fruit, Floral, and Orchid Committees will meet at 11 o'clock a.m., and the exhibition will be opened at 12.30 p.m. The special silver cup given annually by N. N. SHERWOOD, Esq., will be awarded to the best collection of herbaceous and bulbous plants. Members of the various committees and other invited guests will be entertained by the council at luncheon at 1 p.m. By kind permission of MARY Countess of ILCHESTER, the beautiful private gardens will be open to the public, who will be charged a small admission fee for the benefit of the gardening charities. We hope that the weather will be brighter than it is at the time of writing, and that the exhibition will be attended with marked success.

BRITISH GARDENERS' ASSOCIATION.—We are informed that a meeting of the Executive Council of this Association was held at the Royal Horticultural Hall on June 25, Mr. W. H. DIVERS in the chair. A vote of condolence was passed with Mrs. MASTERS and family on the death of the late Dr. MASTERS who had taken a keen interest in the association from the beginning. Mr. CHAS. FOSTER, University College Gardens, Reading, was elected chairman for the ensuing year, and Mr. DIVERS vice-chairman, the last-named being accorded a hearty vote of thanks for his services during the past year. Fifteen new members and one apprentice were elected. Messrs. WATSON & CASTLE were elected to the Publication Committee. The question of having a paid secretary was again discussed, but no definite action was taken.

THE SOCIETY OF ARTS will hold a conversazione, by arrangement with the council of the Royal Botanic Society, in the gardens of that society, Inner Circle, Regent's Park, on Tuesday evening, July 9, from 9 p.m. to 12 o'clock.

EXAMINATION IN HORTICULTURE.—The Report of the Annual Examination in the Principles and Practice of Horticulture, held on April 10 last, by the Horticultural Society, has just been published; 150 candidates entered. Three hundred marks were allotted as a maximum. Twenty candidates, or nearly 14 per cent. of the whole

number, were placed in the first class. Fifty-nine, or about 40 per cent. of the whole, were placed in the second class. Sixty-three, or a little over 44 per cent., were placed in the third class. It is noticeable that the successes of the first class are nearly double those of 1906—13.8 per cent. (1907), 7 per cent. (1906)—while the second class has decreased from 50 to 40 per cent. The third class is nearly stationary. The examiners in their report make the following remarks:—"With regard to the papers on the Principles of Horticulture, many of the answers were extremely good, but too many candidates gave an account of assimilation in error for respiration; and in replying to the question in the divisions, gave merely the distinctions between the classes of Dicotyledons and Monocotyledons, which was not asked for. It is to be regretted that Darwin's mistake as to the 'injuriousness' of self-fertilisation still holds its ground, though it has been shown to be not true to nature thirty years ago. With regard to the Practice of Horticulture, with a few exceptions the candidates answered the questions fairly well. None of them obtained the maximum number of marks. Many candidates started well and obtained the maximum number of marks in the first or second questions, but fell off towards the third and fourth. There are about 26 minutes allowed for each question, and if the eight questions were apportioned into 26 minutes each, a more uniform degree of merit would be obtained. Allusion has been made in previous years to the candidates introducing irrelevant matter into their answers, but there is not much reason for comment on this point in the present examination. The main cause of failure has been the spending of too much time on the first questions and failing for want of time towards the end. In two or three instances three questions were answered well, and then a very poor attempt indeed made at a fourth, evidently owing to want of time."

THE KING'S BIRTHDAY HONOURS.—It is satisfactory to find that the importance of science is acknowledged in the recent list of Birthday honours, and that Professor RAY LANKESTER, LL.D., F.R.S., has been created a Knight Commander of the Bath. There are several names more or less intimately known in horticultural circles. Among these may be mentioned Mr. WILLIAM HENRY DUNN, Sheriff of the City of London and a member of the governing body at the Royal Botanic Society, who receives a knighthood. The list of appointments to the Imperial Service Order include the names of Mr. CHAS. JORDAN, superintendent of St. James's, Green, and Hyde Parks, and Kensington gardens; and Mr. CHARLES EUSTACE PILLANS, horticultural assistant Department of Agriculture in the Cape of Good Hope Colony. Many of our readers know Mr. JORDAN intimately, and will receive the news of the honour now conferred upon him with pleasure.

SIR JOSEPH HOOKER, G.C.S.I., C.B., F.R.S., &c.—Our readers will join us in congratulating Sir JOSEPH DALTON HOOKER, on the attainment of his ninetieth birthday on Sunday last, June 30, and in his appointment on that day by H.M. the KING to the Order of Merit. An excellent portrait of Sir JOSEPH HOOKER was published in a supplementary illustration to our issue for January 7, 1905.

HUNGARIAN FRUITS FOR THE ENGLISH MARKET.—Our cultivators of hardy fruits are promised further competition in the shape of preserved Plums, Apricots, Peaches, Tomatos, etc., in the course of a short space of time. The secretary of the Royal Hungarian Museum in London has already entered into communication with important manufacturers and wholesale merchants with the objects of ascertaining their wishes, sorts of fruit preferred, and value.

SECRET COMMISSIONS.—We are informed that at a meeting of the Council of the Secret Commissions and Bribery Prevention League, held on July 2 at the London Chamber of Commerce, Sir EDWARD FRY was elected as first president, and the Archbishop of CANTERBURY, Earl FORTESCUE, Lord AVEBURY, Sir W. H. HOLLAND, Sir W. MATHER, and Mr. DAVID HOWARD were elected vice-presidents. Mr. DAVID HOWARD, who presided, was able to report that the League had made considerable progress, and was obtaining an increasingly influential membership. Mr. R. M. LEONARD has been appointed secretary. The offices of the League have been removed to 3, Oxford Court, Cannon Street, London, E.C.

FRANCO-BRITISH EXHIBITION, 1908.—A deputation of the French Agricultural and Horticultural Committee of this proposed international exhibition arrived in London on June 30. The deputation consists of the president, M. VIGER, Senator, and formerly Minister of Agriculture; M. TRUFFAUT, vice-president of the French National Society of Horticulture; M. SENER, formerly president of the Agricultural Machinery Society; M. CHATENAY, general secretary of the French National Society of Horticulture; M. GUILLAUME, architect to the Committee; and M. MARTEL, who is attached to the Department of the Minister of Agriculture. The deputation is visiting London with the object of completing all the details for the collective participation of French agriculturists and horticulturists in the Franco-British exhibition which will be held next year. A special committee, composed of agriculturists and horticulturists of England and France, will undertake the organisation of the agricultural and horticultural sections of the exhibition.

AGRICULTURAL EDUCATION.—The Departmental Committee, of which Lord REAY is Chairman, held meetings on the 18th, 19th, and 20th inst., Lord BARNARD presiding in the absence of the Chairman at the Hague Conference. The following witnesses attended and were examined:—Mr. W. A. SIMMONS, estate agent, Reading; Miss EDITH BRADLEY, late Warden, Studley College, Warwickshire; the VICE-CHANCELLOR and Professor WEISS, Manchester University; Mr. H. HAMEL-SMITH, late resident in the West Indies; Mr. C. N. P. PHIPPS, Chairman of the Agricultural Education Committee of the Wiltshire County Council; Mr. W. McCracken, agent to Lord CREWE; Mr. C. H. EADY, land agent, Lockinge, near Wantage; Professor T. W. CAVE, F.R.C.V.S., South-Eastern Agricultural College, Wye; Miss MILLER, Farnham; Sir JOHN MACFADYEAN, Royal Veterinary College; Mr. J. PETER, Berkeley, Gloucester; Rev. J. B. MCLELLAN, Principal of the Royal Agricultural College, Cirencester; Mr. W. P. WRIGHT, Lecturer in Horticulture, Kent County Council.

— At further meetings on June 25, 26 and 27, the following witnesses attended and were examined: Mr. W. J. GRANT, Director of Agricultural Education, Monmouthshire; Sir JOHN COCKBURN, K.C.M.G.; Mr. P. ALLTOFT, Instructor in Agricultural Processes; Mr. CHAS. SHEATHER, F.R.C.V.S., Master of the Farriers' Company; Mr. GEORGE LANGRIDGE, late President of the 'Surveyors' Institution; Mr. W. GOARING, Horticultural Instructor, East Sussex; Professor CAMPBELL, Department of Agriculture and Technical Instruction for Ireland; Mr. JAS. MACDONALD, Secretary, Highland and Agricultural Society of Scotland; Mr. W. H. DUNN, Chairman of the Berkshire County Council; Mr. J. C. DREWITT, West Sussex County Council; and representatives of the Dauntsey Agricultural School, Wiltshire, and of the Swanley Horticultural College, Kent.

FLOWERS IN SEASON.—Mr. AMOS PERRY, Hardy Plant Nursery, Enfield, sends a hybrid *Heuchera* with white flowers, named Perry's White. The variety has red or pink stamens, and a very large inflorescence.

EUROPE AND THE FAR EAST.—Mr. A. UNGER, of the firm of Messrs. L. BOEHMER & Co., Yokohama, Japan, writes us as follows:—"This is to inform you that we received to-day (May 28) your papers dated April 27 and May 4. They reached us by the 'Empress of China,' and made the trip from London in 22 days, a record mail, which we think will be interesting to your readers, as it proves that the communication between Europe and the Far East is being improved, especially now that a connection has been made via Siberia. It is possible for us to leave Yokohama, and arrive 18 days later in London."

THE KEIFER PEAR.—It is stated by a market orchardist in *The Canadian Horticulturist* for June that it "is not in so good demand as it used to be," and he is, therefore, grafting *Duchess d'Angouleme* on his trees of Keifer, and in the last two years he has grafted 2,000 trees with this variety. The *Duchess* is more free from blight than almost any variety of Pear, bears regularly, and ships well to Europe.

HAY CROPS AND THE ABSENCE OF SUN.—In view of the unsettled character of the weather, and of the consequent difficulty in securing the hay crop, the Board of Agriculture draw the attention of farmers and others to the system of ensilage as a means of conserving crops of Grass and Clover. Copies of leaflet No. 9, which describes this process, may be obtained post free and free of charge upon ap-

plate, and it may be purchased smooth or ribbed as may be desired. The wire causes only the smallest shade on the plants beneath the roof. The extra cost of the article is inconsiderable, and reckoning the durability of wired glass, it is said to be the cheaper in the end. The raising of the warmth of the interior of a wired-glass-covered house is rather longer in point of time by sun-heat; on the other hand, the house parts with its heat more slowly, and those dangerous and sudden changes of temperature experienced in ordinary houses are avoided.

Publications Received.—*Flower Show Fixtures for 1907*, from Messrs. Austin & McAslan, Glasgow: a folded card containing the dates of horticultural exhibitions, chiefly those which will be held in Scotland.—*Report (Annual) of the Botanic Garden Syndicate*, being a report of the work done in the Cambridge Botanic Garden.—*Field, Paths and Green Lanes*,

FIG. 5.—A PERGOLA OF ROSES IN THE ROYAL GARDENS, KEW. (See p. 13.)

[Photograph by C. P. Raffill.]

THE GERMAN ARBORICULTURAL SOCIETY.—Professor SCHWAPPACH, master forester, has been appointed vice-president of this society (*Deutschen Dendrologischen Gesellschaft*) in the place of Prof. PRITZER, deceased.

ANDRE LAURENT.—We note the death, at Limoges, at the age of 82 years, of this famous raiser of new varieties of Lilac, Clematis, and fruits.

PROFESSOR DR. KARL MULLER.—We regret to announce the death, on the 13th inst., of this professor of botany at the Horticultural Institution, Dahlem, and Dean of the Technical High School at Charlottenburg, at the age of 51 years. The deceased was for many years Dean of the Berlin Agricultural High School.

plication to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

WIRED GLASS IN THE ERECTION OF GLASS-HOUSES.—This material for roof-glazing is coming much into use in Germany. It is described as possessing many advantages over ordinary glass, either rough or ribbed plate, and polished glass, in its capability of withstanding hail, wind pressure, blows, and atmospheric influences, most important facts for gardeners. The wire network is incorporated with the glass whilst the latter is in a fluid state; and the transparency of the material is not influenced thereby, it being as transparent as ordinary rough

Edition V., by Louis J. Jennings. Published by John Murray.—*Summer Holidays*, by Percy Lindley. This is a handbook issued by the Great Eastern Railway Company, and describes some of the more interesting features in the less known districts of East Anglia, and in the country between the Cromer coast and the Norfolk Broads. It is an attractive little book, and is freely illustrated, many of the illustrations being reproduced in colours.

KEW NOTES.

GARDEN ROSES.

[SEE FIG. 5 AND SUPPLEMENTARY ILLUSTRATION.]

WHEN the *Rhododendrons* have passed their best at about the middle of the month of June the *Roses* claim more attention perhaps than any

other subject grown in the open-air at Kew. During the month of July the larger number of visitors who walk amongst the beds is sometimes evident in the bare patches to be seen on the lawns where the grass has been much trodden.

Few of the persons who admire the beautiful Roses have any idea of the amount of labour expended to obtain these results. To name only one item will suffice. The soil in which they grow has all been obtained from a distance. A few inches below the surface of the ground at Kew the soil, except in one or two restricted areas, is practically pure sand. This has been dug out to a depth of about 2 feet and replaced with the top-spit from old pasture land now being built on at Hounslow, Willesden, &c.

In gardens where there is ample space for the growing of Roses, as at Kew, it is better to restrict each bed to one variety. The effect

the newer Hugh Dickson (both good as standards), Merveille de Lyon, Ulrich Brunner, Victor Hugo, Mrs. John Laing, and its blush sport Mrs. H. W. Sanford.

The Hybrid Tea Roses being more robust in growth, and quite as free-flowering and fragrant as the tea-scented varieties, their great popularity is not surprising. During recent years they have been planted largely at Kew. Especially worthy of mention are Augustine Guinoisseau, Captain Christy, Caroline Testout (good both as a standard and bush), Clara Watson, Frau Karl Druschki, which is the best white Rose for any purpose; Gloire Lyonnaise, Grace Darling, Gustave Regis, Killarney, La France, Madame Abel Chatenay, a very distinct and pleasing Rose, especially in the bud; Madame Ravary (orange yellow), Marquise Litta, Mrs. W. J. Grant (syn. Belle Siebrecht), and Viscountess Folkestone.

to respond most readily at Kew to this treatment are Clio, Dawn, Frau Karl Druschki, Gloire de Dijon, and William Allen Richardson. Another Hybrid Tea which resents hard pruning is Grüss an Teplitz. If allowed to grow naturally, merely cutting out the old wood when the bushes become too thick, this Rose is a gem for massing on the outskirts of the Rose garden and in the pleasure grounds.

Climbing and rambling Roses are also well represented on the Pergola (see fig. 5) near the Rockery, in the Rose Dell near the Pagoda, and in numerous beds in various parts of the grounds. Many are at present in flower, while others, only now in bud, will prolong the flowering season for some time to come. *D. D.* [An excellent Hybrid Perpetual Rose is Pride of Waltham, of which an illustration is given at fig. 6. It has a good habit of growth, and the flowers are of large size, with petals of much substance; colour, pale pink, shading to rose.—*Ed.*]

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

STRAWBERRY KENTISH FAVOURITE.—By a rather limited vote an Award of Merit was granted to this Strawberry by the Fruit Committee of the Royal Horticultural Society at the meeting held on June 25 because it was claimed for the variety that it was very early in fruiting. It was also agreed to ask for plants to be sent to Wisley Gardens later on for trial there in comparison not only with Royal Sovereign, but also with other well-known varieties. It is most important that the Royal Horticultural Society's gardens should be used to the utmost for trials of this description, especially as the soil and position of these gardens suits Strawberries, as well as many other plants. *A. Dean.*

STRAWBERRY, THE LAXTON.—Although this variable Strawberry has been condemned by some growers as useless, and in certain seasons and districts it has undoubtedly proved disappointing, compared with the promise of its early years, yet very favourable results are still obtained at times. This season, for instance, I have had a good crop of extremely fine fruits from plants in a rich, deep loam, and so satisfactory has the variety proved that it will be still kept on trial. Gathering was commenced about the same time as from Royal Sovereign, the fruits were nearly as large, of handsome conical shape, rich in colour, and of capital flavour for an early variety; much superior in that respect to the variety mentioned, distinctly suggestive of King of the Earlies and Vicomtesse H. de Thury, though these are two of The Laxton's remotest ancestors. I have never remarked before the characters of Sir Joseph Laxton so strongly developed as in this year; in some of the fruits before they were fully ripe these were most conspicuous as regards form and colour, and it was not easy to distinguish the two varieties by the fruit alone. It was one of the main points the raisers had in view, namely the production of an early Sir J. Laxton on account of the valuable firmness of the latter's fruit. The extraordinary variability of some Strawberries in different seasons and distinct soils is most puzzling, and is a subject that would be well worth careful investigation. Heavy losses are occasionally experienced by purchasing largely of varieties that have grown exceedingly successful in some districts and in particular years. This makes growers for market very cautious about investing in novelties, and consequently very slow advance is made. The mistake to my mind is that most growers wait until the varieties are obtainable in large numbers instead of testing the most promising novelties for themselves on a moderate scale, using them as soon as they are sent out. *Lewis Castle.*

SAXIFRAGA AIZOON ROSEA.—An error has crept into my note (see p. 418) on this plant. At the eighth line from the end, "the purplish colour of the petals" should read "the purplish colour of the peduncles." This colouring of the stems is very pronounced, and gives an added beauty to a very desirable plant. By raising seedlings from this plant, flowers of a deeper or richer tone of colour may probably be obtained. *E. Jenkins.*

FIG. 6.—ROSE PRIDE OF WALTHAM, COLOUR PALE ROSE.

obtained from a dozen or fifty Rose plants of one variety in a bed is more pleasing than when a number of sorts are planted in the same bed. It is better to limit the number of varieties grown than to cultivate a large collection and thus spoil the effect. The varieties grown at Kew are selected as far as possible for their free-flowering qualities and good habit.

Most of what may be termed the garden Roses are grown on either side of the path on the outskirts of the Italian Garden, and at either end of the Palm House. The Hybrid Perpetual varieties found to succeed the best at Kew include such well-known varieties as Alfred Colomb, Baroness Rothschild, Camille Bernardin, Captain Hayward (a perfect bedding Rose), Countess of Oxford, Duke of Edinburgh, General Jacqueminot, Margaret Dickson, and

Tea Roses, being of more moderate growth, are grown at Kew in rather smaller beds on the inside of the path previously mentioned. Some of the best sorts are Anna Olivier, Corallina (rosy-red), one of the best Tea Roses of recent introduction; G. Nabonnand, Hon. Edith Gifford, Jean Pernet, Madame Lambard, Maman Cochet, and Princesse de Sagan.

Several varieties of extra vigorous growth are grown on the pegging-down system, that is, instead of the usual practice of shortening back all the growths, the vigorous young shoots are bent down and fixed in this position by the use of pegs. Only the weak shoots and the older wood are cut out in spring. Many more flowers are obtained from a bed of Roses treated in this manner than it is possible to get from plants pruned in the ordinary way. The varieties found

SUMMER PRUNING OF FRUIT TREES.—I should have imagined that the results following the summer pruning of fruit trees in the open were sufficient to show the benefits of the practice. Mr. Castle (see p. 424, vol. xli.) asks for proof that by summer pruning ordinary woodbuds become converted into fruit buds the following year. Their formation in the form of imperfect fruit spurs the following year certainly furnishes ample proof. The initial change or process of conversion seen in these basal woodbuds after the pruning the first year, must be followed by the completion of the conversion the second year into perfect fruit buds before the actual results can be seen, and in such results is the practice of summer pruning fully justified. When these wood shoots, ordinarily pinched, or cut back at some period of growth during the summer, are not so treated, but are left to make their full season's wood growth, they are, as is common practice in such cases, cut back to one or two buds in the winter. Not fruit buds or spurs, but mere wood shoots are again formed, and so the process of wood production goes on. That is not fruit production or proper culture. If the hypothesis in relation to the practice of summer pruning be wrong, then all our practice is folly. It is odd that whilst in relation to wall trees, espaliers, or cordons, no one seems to question the value or necessity of summer pruning, the present discussion is apparently made to relate to bush or pyramid trees only. At least, I assume so much. There is one thing which it would be interesting to learn, and the results of the experience of the many able cultivators of fruit who annually report on the condition of the season's fruit crops would be specially helpful to that end if they would state whether in reference to, say, Apples and Pears, the trees which, not the one year alone, but habitually, give the best crops are those on which summer pruning is practised or not. A trial of the practice of summer pruning fruit trees might well be the subject of experiment at Wisley, as opposed to mere thinning on, say, 12 trees of any one or more varieties. Of course, different results might be obtained in diverse soils and situations. Still, it is an experiment which should be conducted. It does not follow that because a practice is not only common, but very widely regarded as essential, it is therefore absolutely right. It may be wrong, but proof that it is wrong is needed, and so far little seems to have been forthcoming. The greater number of the replies printed in these pages were favourable to the practice. Many of the subjects discussed in lectures and papers to-day have much less practical value to gardening than has that relating to the merits of summer pruning and non-summer pruning of fruit trees. *A. Dean.*

—During the summers of 1905 and 1906 an espalier tree of Winter Nelis Pear, trained on a south wall, was selected by me for an experiment in summer pruning. The first season the shoots were allowed to grow until July 20, when they were cut back in the usual manner. The result was a moderate formation of fruit spurs or flower-buds. At the commencement of June, 1906, the side shoots were pinched back with the thumb and finger, which treatment was continued throughout the summer. The result of this treatment, so far as the production of fruit spurs is concerned, was highly satisfactory, for the tree this season was covered with blossom. I am firmly convinced that the judicious stopping of the shoots acts as a material aid in the production of fruit spurs. *C. R., Herts.*

SWEET PEA COUNTESS SPENCER.—This variety seems to be producing more surprises this season in the shape of progeny with new colours. I am sending you a few of those at present in flower in my garden, all of which show the true characteristics of the Countess Spencer type, viz., the large wavy standard, large wings enfolding the keel, and the straight and open keel. The variety Countess Spencer resulted from a cross effected between Prima Donna and an unfixed seedling in 1899. The raiser was Mr. Silas Cole, Althorp Park Gardens, and seeds were put in commerce before the variety was fixed. This, and the fact that some seeds of another variety were accidentally mixed with it, would account for the appearance of these so-called sports. There can be no doubt that these sports are the result of cross-

fertilisation, and until recently I imagined that they must all be the result of Mr. Cole's crosses, but I am now of the opinion that, owing to this flower possessing an open keel and protruding stigma, cross-pollination may be effected by other than human agency. The Countess Spencer type of flower is not so readily self-fertilised and consequently is the more easily cross-fertilised than the older type of flower. *Hugh Aldersey, Aldersey Hall, Cheshire.* [Exceptionally well-cultivated flowers of the Countess Spencer type accompanied this note.—ED.]

THE CULTIVATION OF GLADIOLUS.—In dry, light, or sandy soils, in addition to well-decayed stable dung being dug into the soil previous to planting, abundant moisture should be afforded in the absence of heavy rains during the active season of growth. The quantity of moisture should, however, be lessened or discontinued before the flowers appear, a short period of ripening being beneficial if not too severe; this causing greater firmness in the tissues and thereby flowers of better quality and durability. Excessive succulence is not beneficial to plant, flower, or corm. *F. M.*

THE WEATHER OUTLOOK.—"Winter lingering chills the lap of May," wrote Oliver Goldsmith 150 years ago, or thereabouts. Had Goldsmith lived in these days, he might easily have extended his poetical remarks to the whole of the month of June. As regards Plums, Pears, and Apples, I mention them in their order of flowering. There may be a few fruitful trees here and there, especially in favoured localities, but, from what I learn, these fruits throughout the country are practically a general failure. A redeeming point may, however, be found hereabouts in both black and red Currants, and, if seasonable summer weather should set in quickly, there may also be some Strawberries. Last year the Oaks in this district suffered severely from the leaf-devouring larvæ of the moth *Tortrix viridana*; there were but few Acorns. This year the trees are again being quite denuded of their leaves by the same plague. The present season is one rampant with weeds of all sorts. Crops, such as Barley and Wheat, have, in many instances, a starved appearance, and the fields are overgrown with Charlock (*Sinapis arvensis*). With a view to killing the flower to prevent the ripening of the seeds, I saw some fields being sprayed with a chemical mixture; in another some men were engaged with knives cutting off the flower-heads for the same end. Grass is everywhere abundant, but is spoiling for the want of cutting, which is being delayed by the wet. Turnips, Mangolds, Beet, and Carrots all stand in need of warm sunshine. Last year at this time the crops were suffering from drought, when springs and streams ran low. This year they are all running full. Notwithstanding the fruitless state of some of our orchards, all shrubs and herbaceous plants have done well in this rainy season. My Laburnum Adamii has flowered splendidly, considering it is a young tree. It has now five well-developed branches of *Cytisus purpurea*, and more are forming. It also has 55 handsome racemes of *Laburnum vulgare*—some on the lower part of the tree, some in the middle, and some quite at the top, besides some hundreds of the curious bronzy-coloured flowers of *L. Adamii*. *W. Miller, Berkswell, June 25.*

A ROCK GARDEN AT BASTON MANOR.—I recently visited the gardens at Baston Manor, Hayes, where many of the plants seen are direct introductions from their natural habitats, having been collected and sent home by the late Capt. Torrens during his travels abroad. They have been planted as nearly as possible under the same conditions as they formerly enjoyed. The centre of interest is the rock garden, and here many interesting plants were noted in flower, including a large number of Saxifragas. *Veronica rupestris* and *Gypsophila prostrata* made a pretty display. *Iberis sempervirens* and *I. gibraltarica*, *Aster alpinus* and *Erigeron* species were all seen in their best condition of flowering, whilst *Aubrietias* in several of the best varieties formed a bank of colour. *Saponaria ocyroides* has flowers a pretty shade of pink. The deep purple coloured flowers of *Ramondia Nathaliae* showed well against the white of the *Iberis*. Other plants in flower at

the time of my visit included *Lithospermum prostratum*, *Lychnis viscaria*, *Achillea aurea*, *Erodium geranioides*, *Coronilla minerva*, *Gnaphalium aureum*, *Cheiranthus mutabilis*, *Pyrethrum argenteum*, *Haberlea rhodopensis*, *Geranium sanguineum*, *Achillea* species, *Ramondias*, and a host of other pretty flowering plants. *Adiantum pedatum* in large clumps was very pretty. Among other plants in this beautiful garden may be mentioned the Japanese Tree Pæonies, and climbing Roses. *A. H.*

BONES FOR A VINE BORDER.—I have lately had occasion to move a portion of a vine border that was formed more than 20 years ago, and in which a liberal quantity of half-inch bones had been introduced. They did not seem to have decayed, nor had the vine roots embraced them in a single instance. Every person who writes on vines and the composition of a vine-border invariably recommends half-inch bones as one of the ingredients. I fail to see what good purpose this expensive article serves in a compost for vines. *W. P. R.*

HARDY AND YELLOW RHODODENDRONS.—In reference to Sir Herbert Maxwell's criticism of my opinion of the hardness of *R. arboreum* (p. 374) I may say that we have tried, at Bagshot, many of the Himalayan species he mentions, and have found none of them to be perfectly hardy, *R. barbatum* being the most promising. In speaking of the hardness of many plants, however, it is almost impossible to say which are hardy or otherwise unless they are tested, but I have noticed that in districts which are subject to late spring frosts many plants cannot be grown to such perfection as in places where a low May temperature is rare. I consider this district to be one of the coldest south of the Thames, especially during the spring, 6° to 10° of frost having been registered here about the middle of May for the past four or five years in succession. I agree with Sir Herbert Maxwell that the Rhododendrons he mentions are worth growing, but I should advise anyone to test them first, as it is not so much the amount of cold that causes the injury as it is the time of year when it is experienced. Mr. Ryan takes me to task for stating that no hardy yellow hybrid Rhododendron has yet been raised, and cites a plant that, from his description, is *R. campylocarpum*, a true species from Sikkim, and which I mentioned as one of the plants from which a yellow hybrid might in time be used. *R. campylocarpum* we have found to be tender here. *R. Smithii aureum* is certainly a dull, yellow-flowered plant, but this is a semi-deciduous hybrid raised from a seedling Rhododendron and *Azalea sinensis*. It is not a very handsome plant nor one that is likely to become very popular. *J. Clark, Bagshot, Surrey.*

ROSE.—I am sending some single, Apricot-pink coloured Roses. I have never had this variety before; it has appeared as a climbing Rose for the first time in my collection. I cannot account for its appearance, unless it be a sport of the Carmine Pillar Rose, of which I have a number of plants. It may perhaps be a reversion to some ancestral form of the Carmine Pillar Rose. Is this variety known elsewhere? If so, how did it originate? *E. Bonavia, M.D., Westwood, Richmond Road, Worthing, June 27, 1907.* [We do not recognise the variety from the specimen received, of which the petals were already falling. It does not, however, appear to be of the same type as Carmine Pillar.—ED.]

RHODODENDRON PURITY.

No hardy shrubs are more handsome in their season of flowering than the Rhododendrons, whilst the plants being evergreen are objects of beauty at other seasons of the year, and especially in winter, when their fine, bold foliage affords a touch of colour to the shrubbery, and furnishes a pleasing contrast to the deciduous shrubs around them.

Our illustration (see fig. 7) is a plant of the variety Purity growing in a Donegal garden. The snowy-white trusses of flowers, each with a faint yellow "eye" are very distinct in appearance. The variety is amongst the best of the light flowered forms, and is a favourite in gardens.

MARKET GARDENING.

TOMATOS.

CONSTERNATION was written on the faces of the many market growers of Tomatos when for mid-June the record low price of 3s. 6d. per dozen pounds was returned for their fruits. Beyond the large supply from the Channel Islands, there was no apparent cause for this low price. Trade was bad certainly, due, the shopkeepers affirm, to the inclement season.

Against this the fact must be recorded that the present weather is against a quick ripening of the fruits inside the plant houses. As I write (at the end of June), prices have gone up 1d. per pound, which is a good thing for the growers, fuel being so dear.

Points to be strictly observed in marketing if best returns are sought are honest packing, with full weight, and all fruits should be coloured. The prices ruling at the Borough and the Brentford markets are similar to those of Covent Garden, which may be said to rule prices generally.

accommodated for a large portion of the year are small in berries and have no "bloom," showing the absolute need for special treatment in order to obtain the best results. Gros Maroc has been seen all through the month of June, but beyond its good appearance, this is not a Grape of high quality thus early in the year.

Black Alicante always commands a certain trade, and the samples are very good for this early season.

Muscat of Alexandria, at prices of 1s. to 5s. per pound, correctly represents the difference in the value of the samples.

Very few high-class bunches are to be seen. The Guernsey-grown bunches are now of better colour, but they are very small.

Canon Hall Muscat from Guernsey is seen, but is not remarkable in quality. In addition to the above kinds of Grapes, there are some Gros Colmar from Worthing, but not of much worth. Belgium growers are also sending a few Black Hambros.

Trade is about the average for the season, and with the "small fruit" season at hand, prices will not improve. *Stephen Castle.*

[Photograph by Miss Wallace.]

FIG. 7.—RHODODENDRON PURITY, FLOWERS WHITE WITH A YELLOW "EYE."

This refers also to the farther Manchester centre, for the prices are telephoned from each market, and should they be high at the cotton centre, Covent Garden supplies are transferred to Manchester by the truck load.

The glass area devoted to the market culture of Tomatos is this season in excess of that of any previous year, and thus it is not likely that high prices will be maintained before the advent of the outdoor crop.

Plants in cold houses are not doing well; sun is greatly wanted.

GRAPES IN JUNE.

THE consumption of fruit is always greater in hot weather, and the present unseasonable weather is checking the demand for both indoor and hardy fruits. Strawberries are now in season, and Cherries from Kent are in; consequently, there is a less demand for Grapes. Black Hambro is generally realising from 10d. to 1s. 6d. per pound, but I know of more than one grower who is realising 2s. 6d. per pound for his bunches. There always is a demand for good bunches weighing 1 lb. and over, bunches that can be used with effect on the dessert table. The bulk of this variety that comes from the Channel Islands, while good in colour and size of berries, is particularly small in the bunch. Bunches from vineries in which plants are

F.R.S. The announcement was received with great pleasure by the committee.

Sweet Peas and the Mendelian Laws.—Mr. R. H. BIFFEN showed a very interesting series of Sweet Peas to illustrate the discoveries so far made in regard to the laws of inheritance as exhibited in these plants. The great majority of crosses and so on had been made by Mrs. BIFFEN. The following were included in the series.

(1.) Cream crossed with white gave all white (i.e., white dominant over cream). In the second generation from these whites self fertilised, white and cream varieties were produced in the proportion of three white to one cream. The cream breeds true in the following generation, but only one in three of the whites is pure, the remaining two again producing creams.

(2.) White crossed with white in the first generation gave a Sweet Pea approaching Painted Lady in type. The seeds of this, by self fertilisation, gave Painted Lady and white in the proportion of nine of the former to seven of the latter, showing that one white parent carries a certain factor, the other, another, which meeting produce the red colour. In the third generation the whites breed true and one of the reds.

(3.) White \times blue in the first generation gave purple, and in the following generation purple, blue, white, and Painted Lady. The parents thus carry the two red-producing factors whose existence is demonstrated in the cross between the two white Peas mentioned above. Where these meet in the presence of the blue colour, purple is formed, but in its absence Painted Lady. Seeds of the purple varieties may reproduce the whole colour series again, those of the Painted Lady, white and Painted Lady only. The white varieties breed true, but blue may throw white.

(4.) Cream with purple Picotee edge \times Mont Blanc (white) gave purple and in the second generation cream, white, cream with Picotee edge, white with blue edge, Painted Lady and purple. The character producing the Picotee is dominant over the non-Picotee. The parents carry the factors for red demonstrated in the case of the cross between the two white varieties, which on meeting give Painted Lady. In addition to these characters there are yellow and white, the former being recessive to the latter. Non-Picotees breed true to this character. Picotees breed true in the proportion of one to three. Thus a Picotee white may throw Picotee white, Picotee cream, plain white and plain cream, but a plain cream will breed true from the outset.

(5.) Eric Hinton (pink, with waved standard) \times Hon. F. Bouverie (pink, with buff tinge due to the presence of yellow chromoplasts, standard not waved). In the first cross the colour of the flowers was deep rose, similar to Prince of Wales, and all had flat standards, in the second the flowers were yellow, pink, and buff with flat standards, and yellow and pink with waved standards. Waved forms had not so far occurred in buff colours.

(6.) Bouverie (pink and cream) \times Navy Blue gave in the first generation purple. In the following generation segregation into purple, pink, pink with cream, cream and tinged white occurred, and each of these types may or may not be flaked.

(7.) If this be compared with the results obtained by crossing another pink with Navy Blue, the same colours are produced, but no flaking occurs owing to the absence of the determining factor in one of the parents.

The series demonstrated the possibility of predicting the colour of the offspring in the second generation of any particular cross with great certainty, and showed the facility with which any particular two characters may be combined in any plant. In answer to questions, Mr. BIFFEN said that it was impossible to say beforehand in the case of two whites whether or not they carried the colour-producing factors. This could only be determined by experimental crossing. Several members remarked upon the desirability of trying the effect of crossing the wild Sweet Pea of Sicily with some of those known at present. A hearty vote of thanks was accorded to Mr. BIFFEN for his exhibit and explanatory remarks.

Improved Clover.—Rev. Professor HENSLAW showed on behalf of Mr. A. G. LEIGHTON, of Newcastle, Staffs, specimens of Mr. LEIGHTON'S

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JUNE 25.—*Present:* Mr. E. A. Bowles, M.A. (in the chair), Prof. G. Henslow, Prof. G. Boulger, Rev. W. Wilks, Messrs. Cuthbertson, Odell, Güssow, Shea, Worsdell, Worsley, Bennett-Poe, Douglas, Masee, Pickering, Holmes, and Chittenden. Visitors, Mr. and Mrs. Biffen.

The late Dr. Masters.—The Chairman read the following letter from Mrs. MAXWELL MASTERS:—"Mrs. MAXWELL MASTERS and her daughters wish to thank the members of the Scientific Committee for their very kind and much valued sympathy with them in their irreparable loss. The Scientific Committee and its work were always of the deepest interest to its chairman, and the fortnightly meetings formed one of the most agreeable interludes in his busy life."

New Vice-Chairmen.—Rev. W. WILKS announced that the Council had that day resolved to appoint Messrs. J. T. BENNETT-POE and E. A. BOWLES to fill the vacant places caused by the loss the committee and the society had sustained through the lamented death of Dr. M. T. MASTERS, F.R.S., and Professor MICHAEL FOSTER,

Improved Clover. Mr. LEIGHTON wrote: "The form which I have produced assumes a more permanent character than the commercial plant. This qualification of permanency was the condition required; for that derived from commercial seed appeared to run through the cycle of life during one summer; this having been brought about by the system of producing seed for sale during the first year, the consequence being an annual tendency which by this continued selection becomes fixed and hereditary. I find that the period of life may be shortened in *Trifolium medium*, which brings with it more seeding capabilities combined with succulency and size of foliage. In like manner I find that *T. pratense* can be made more permanent, and this permanency brings with it a more procumbent habit, less succulency and size." The matter of Clover standing over the first winter becomes a question of national importance; farmers appeared to have a good plant at autumn, but the following spring all the Clover had gone. This was attributed to Clover sickness, but the fungus which is said to produce the trouble accompanies the death of most annuals, therefore we may rightly say, Clover sickness was merely a fungus which accompanied the death of the plant.

The experiment conducted at Harpur Adams College, Newport, proves the truth of our investigations. A six-acre field was divided into three sections of two acres each.

Two acres, plot 1: ordinary commercial seed from seedsmen No. 1.

Two acres, plot 2: seed of plants referred to above.

Two acres, plot 3: ordinary commercial seed from seedsmen No. 2.

At harvest, the first autumn after sowing, when the cereals were cut, and for some weeks after on plots Nos. 1 and 3, a good amount of Clover was present. On plot No. 2, although the plant could be seen, it was small (not advanced in growth), but during December, January, and February, plots 1 and 3 appeared to lose plants with a black mould prevalent upon the plant. No. 2, as growing weather came along, showed evidence of great vitality, and produced a magnificent crop of red Clover. In the other plots, although the same quantity of seed was used, Clover almost entirely died out during the winter months. Several members demurred to the statement that the fungus (*Sclerotinia trifoliorum*), which so frequently appears connected with dying Clover, accompanied the death of most annuals, and the committee desired to hear the result of other experiments upon the plants. A hearty vote of thanks was accorded to Mr. LEIGHTON.

Abnormal Cabbage.—W. MARSHALL, Esq., sent a Cabbage from the leaves of which numerous cup-shaped growths had arisen, many upon long stalks taking their origin in the midrib of the leaf. The monstrous condition of Mignonette referred to by Professor J. HENSLOW (*Trans. Camb. Phil. Soc.*, vol. v.) appears to present a similar phenomenon.

Carnation flowers rotting.—Flowers of Carnation were received which had rotted at the base of the petals, and had large black masses (*Sclerotia*) among the decayed portions. The trouble was due to the growth of the fungus *Botrytis cinerea*, which had found congenial conditions for its development between the closely packed petals of the flower.

Double *Miltonia vexillaria*.—In reference to this flower shown at the last meeting from Baron SCHRODER, Mr. WORSDELL reported that it was a good case of true doubling in which the column was split up, the stamens and carpels had become petaloid so as to form three or four extra whorls of petals (labella on one side of the flower, ordinary petals on the other side), while the outer whorls of the flower were quite normal.

Sporting *Coleus*.—Mr. DIVERS showed a large *Coleus* having branches bearing at least five variations in the markings and colouration of the leaf different from those appearing in the first formed shoot. It is rare that so many sports are to be seen upon one plant.

Plane diseased.—Shoots of Plane (*P. acerifolia*) were shown from Romsey by Mr. ODELL which looked as though they had been injured by frost, but which had been attacked by the fungus *Gloeosporium nervisequum*, and this had caused the destruction of the shoots.

LINNEAN SOCIETY.

JUNE 20.—The President read a letter congratulating Sir J. D. Hooker on his sixty-five years of Fellowship of the Linnean Society, and the approaching completion of his ninetieth year, which was signed by the Fellows present.

An acknowledgment from the principal secretary of H.M. the King of Sweden, in reply to the telegram sent on June 6 on the occasion of his golden wedding, was read by the general secretary.

Mr. W. C. Worsdell, F.L.S., exhibited some remarkable cases of carpeloidy of the inner stamens of *Papaver commutatum*, selected from a bed of plants at Kew so labelled, with one specimen of *P. orientale* showing the same peculiarity of separate carpels surrounding the capsule.

The first paper was by the late Dr. Maxwell T. Masters, F.R.S., "On the Distribution of Conifers in China and neighbouring countries," which was briefly explained by Dr. Rendle.

Mr. J. Stanley Gardiner then laid before the meeting a group of papers on the collections of H.M.S. "Sealark."

A paper by Mr. and Mrs. Clement Reid, "On the Pre-Glacial Flora of Britain," was read in title.

Mr. E. A. N. Arber's paper on Triassic species of *Zamites* and *Pterophyllum*, in the absence of the author and at his request, was read in title.

Dr. Rendle gave an account of the plants collected on Mt. Ruwenzori by Dr. A. F. R. Wollaston (1906); from the paper by Messrs. E. G. Baker, S. L. Moore, and A. B. Rendle.

The plants from the Ruwenzori range were collected from two camps—one at about 3,500 feet above sea-level on the south-east slopes of the range between the mountains proper and Lake Ruisamba; the other at 6,500 feet in the Mubuku Valley on the east side of the range. Expeditions were made to intermediate and higher altitudes, the highest camp being at about 12,500 feet, whence plants were collected up to the snow-level at about 14,500 feet on the east side. The time of year was January to July. Dr. Wollaston gives notes on the vegetation at different altitudes from 3,000 to 15,000 feet, and has brought back some photographs showing the nature of the country and different aspects of the vegetation. The plants at the lower elevations include some common tropical weeds, with a fair percentage of more localised species and some novelties. Cultivation ceases above 7,000 feet, and at from 7,000 to 8,000 feet is found the largest forest of the range: a large *Dombeya* is noticeable, and one of the finest trees is a *Podocarpus*. Above 8,000 feet the forest thins out, and is gradually replaced by a belt of small tree-heaths and *Podocarpus*. The Bamboo-zone begins on the east side at about 8,500 and continues up to 10,000 feet. The big tree-heaths begin at about 9,500 feet, at which level a number of terrestrial Orchids were found, with numerous Ferns. From 10,000 to 11,000 feet moss is plentiful on the ground and trees forming cushions 2 feet deep: here were found two tree-Lobelias. In the next thousand feet *Helichrysums*, Lobelias, tree-heaths, and tree-Senecios are the most conspicuous plants. The heaths cease at about 12,500 feet, but the Senecios continue almost to 14,000 feet. Another Lobelia appears at about 12,500 feet, and is found on the steepest slopes almost to the snow-line. *Helichrysums*, sometimes forming bushes 4 or 5 feet high, grow luxuriantly. A small *Arabis* was found at 14,000 feet, and a rush, a grass (a new species of *Poa*), and mosses were found growing up to the level of permanent snow.

Mr. E. G. Baker, Prof. Dendy, Mr. N. E. Brown, and Mr. J. Stanley Gardiner joined in the discussion which followed.

RICHMOND HORTICULTURAL.

JUNE 26.—The above society's annual exhibition of plants, Roses, and other cut flowers, table decorations, bouquets, fruit, and vegetables was held in the Old Deer Park, Richmond, on this date. The society embraces the districts of Richmond, Twickenham, Isleworth, Mortlake, East Sheen, Kew, Petersham, Ham, Barnes, and Roehampton. The exhibits were arranged in three large marquees and one smaller tent, and an inspection of the exhibits could be made under comfortable conditions.

GROUPS AND PLANTS.

For a group of plants occupying an area not

exceeding 100 square feet there was good competition; the plants consisting of ornamental foliage and flowering subjects. The first prize was taken by Sir C. SWINFEN EADY, Oatlands Lodge, Weybridge (gr. Mr. J. Lock), with a display that was not crowded, yet rich in colour and variety. The plants included *Liliums*, *Dendrobiums*, *Oncidiums*, *Francoa*, *Ixoras*, *Carnations*, *Clerodendrons*, *Humeas*, *Gloxinias*, *Cannas*, *Caladiums*, and some fine double-flowered *Clarkias*; 2nd, Mr. W. VAUSE, Nurseryman, of Leamington, Warwickshire.

Mr. VAUSE was the winning exhibitor in a class for six Palms, with tall (10 to 12 feet), fairly well-grown plants, but rather lacking in robustness, and showing the effects of wear.

In the class for a smaller group (the area filled not exceeding 60 square feet), the best exhibit was shown by C. M. BARTLETT, Esq., Uplands, East Sheen (gr. Mr. Hicks), the plants employed consisted chiefly of *Hydrangea Hortensis*, *Clerodendron fallax*, some tall *Codiaeums* and diverse small foliage plants, together with a central Palm and an edging of *Panicum* and *Caladiums*; 2nd, Lady WAECHTER, The Terrace, House, Richmond (gr. Mr. H. Burford), with a group in which *Lilium longiflorum*, *Carnations*, *Gloxinias*, pink Roses, *Caladiums*, with rather tall Palms as a background, formed the major part.

The class for a basket of mixed flowering and foliage plants brought three contestants, and the first prize was taken by Mr. Jas. Lock, gr. to Sir SWINFEN EADY; *Clarkias*, *Crassulas*, and *Oncidiums* were the chief flowering subjects used, and *Adiantums*, *Codiaeums*, and *Caladiums*, the foliage plants.

The best six exotic Orchids were shown by H. LITTLE, Esq., Baronshalt, Twickenham (gr. Mr. A. Howard). The exhibit included some well-flowered *Laelio-Cattleya* G. S. Ball, a *Cypripedium superciliale*, with 12 blooms, *Cattleya Mendellii*, with a fine strong truss of five blossoms, *Laelia grandis tenebrosa*, and others. Mr. W. VAUSE was awarded the third prize.

Groups of *Streptocarpus* were shown in bloom by three exhibitors, and the first prize was taken by Mr. T. J. Wheeler, gr. to W. A. STEARNS, Esq., The Lodge, Englefield Green, with plants of large size, having finely coloured flowers in distinct shades; 2nd, G. ATKINS, Esq., East Sheen (gr. Mr. W. J. Hill).

Excellent *Caladiums* were shown by Mr. H. HICKS in large, well-coloured plants, and he was awarded the first prize in a class for six of these plants.

The first prize for six plants of *Coleus* was taken by Mr. H. HICKS with large, compact examples; 2nd, Mr. T. COOPER, whose plants were equal in colour and development to those in the first prize exhibit, but less regular in size.

The schedule provided a class for six fine foliage plants distinct. S. H. PHILLIPS, Esq., Teddington Hall (gr. Mr. Clarke), showed the best examples, amongst which were fine *Asplenium viviparum*, *Neottia nidus avis*, and *Adiantum concinnum*.

In a class confined to gentlemen's gardeners for six *Adiantum* Ferns, Mr. W. H. CLARKE, gr., Teddington Hall, was first for capital specimens that varied from 2 feet to 4 feet in diameter; Mr. A. Allum, gr. to LIONEL WARD, Esq., Petersham House, won the second prize with smaller specimens. The best single-flowered tuberous-rooting Begonias were displayed by G. ATKINS, Esq., Manaton, East Sheen (gr. Mr. G. Hutt); 2nd, Mr. REDWOOD; and the best double-flowered varieties by Mr. T. J. WHEELER. The best *Gloxinias* came from Mr. A. MEATON, Agill House Gardens, Richmond; 2nd, Mr. Hy. BURFOOT.

ROSES.

The principal class was that for 48 blooms distinct, shown in triplets. The 1st prize included the Gunnersbury Challenge Cup, as well as a considerable money prize. It was taken by Messrs. F. CANT & Co., Colchester, for excellent examples of such varieties as Mrs. Ed. Mawley, Marchioness of Devonshire, Medea, J. B. Clark, General Jacqueminot, M. Paul Lede, Aimée Cochet, Cleopatra, Liberty, &c.; 2nd, B. R. CANT & SONS, Colchester, for very fresh-looking blooms of generally lesser size than the foregoing. Very fine were Helen Keller, Gabrielle Luizette, Marie Verdier, Yvonne Vascherot, Ulrich Brünner, and Le Progrès.

The best 12 blooms of one variety were shown by Messrs. D. PRIOR & SON with Mrs. Sharnan

Crawford of an even size, a capital boxful; 2nd, Rev. J. H. PEMBERTON, Havering-atte-Bower, Essex, with an almost equally fine lot of Frau Karl Druschki.

Messrs. PRIOR & SON were also first in the 24 blooms class, shown in triplets, and first for 12 blooms shown in triplets. The best 12 Teas of one variety came from Messrs. F. CANT & Co., the variety being Mrs. Ed. Mawley; 2nd, Messrs. D. PRIOR & SON, with white Maman Cochet.

A class was provided for local rosarians, and the first prize for 12 blooms was taken by Rev. W. H. OXLEY, Petersham, and he was followed by LIONEL WARDE, Esq., Petersham House.

FRUIT.

A collection of 6 dishes, distinct.—As on many previous occasions, Sir SWINFEN EADY, Oatlands Lodge, Weybridge (gr. Mr. Lock) was first. He staged Hero of Lockinge Melon, Nectarine Dryden, Peach Early York, Grapes Foster's Seedling and Madresfield Court; 2nd, Mr. T. F. CONWAY, Ham House Gardens, his best dishes being Peregrine Peach, Early Rivers Nectarine, and a Melon.

The winner of the first prize for three bunches of Black Grapes was Mr. J. G. WESTON with Black Hamburg; 2nd, Mr. J. LOCK, with Madresfield Court.

The first prize for white Grapes was taken by Mr. J. G. WESTON, Eastwell Park Gardens, Kent, for large bunches of Foster's Seedlings.

The exhibits of Nectarines, Peaches, and Strawberries were generally of fine quality and large size.

VEGETABLES AND ROOTS.

Considering the unfavourable season, these productions were of great excellence, especially the tubers of early Potatoes. Cauliflowers, Onions, Peas, Horn and Intermediate Carrots, Turnips, Saladings, and Cabbages, which were all well shown.

In the class open to gentlemen's gardeners for a collection in competition for Messrs. J. Carter & Co.'s special prizes, Mr. J. T. Conway (gr. to Earl DYSART, Ham House, Petersham) was 1st, with Quite Content Peas, Record Onion, Snowball Cauliflower, Egyptian Beet, May Queen Potato, and Jersey Turnip. Mr. Conway also won Messrs. Webb & Son's special prize for a collection of vegetables, and the Society's 1st prize for a collection of vegetables. In the last-named he showed Asparagus, Market Favourite Carrot, Reliance Globe Beet, New Commander Cucumber (20 inches long), Viceroy Tomato, and Kinver Monarch Cauliflower.

NON-COMPETITIVE EXHIBITS.

In the marquee in which the plants were staged were a number of exhibits from nurseriesmen.

Messrs. W. CUTBUSH & SONS, Highgate, contributed Pæonies, Lilliums, Pyrethrums, Delphiniums, Eremurus robustus, Aquelegias, Campanulas, &c., of fine quality. (Silver Medal.) A number of hardy shrubs, mostly with variegated foliage, was shown by Mr. L. R. RUSSELL, of the Richmond Nurseries, Ivies forming a prominent feature. (Silver-Gilt Medal.) Mr. W. THOMPSON, Sheen Nurseries, arranged a large circular group of plants, consisting of Hydrangeas, Acers, Palms, Hoteia japonica, Begonias, &c. (Silver-Gilt Medal.) A group of 12 feet in diameter was contributed by Mr. H. E. FORDHAM, Nurseryman, Twickenham, consisting of Gloxinias arranged in a setting of Adiantum Ferns. (Silver Medal.) A group of pot Roses, about 150 in number, were shown by Messrs. J. VEITCH & SONS, LTD., Chelsea. These were arranged in a semi-circle, and had R. polyantha and other climbing varieties as a background. (Silver Medal.) Messrs. W. PAUL, Waltham Cross, exhibited largely climbing Roses in pots, cut Roses in baskets, including some of the novelty, Warrior, a bright crimson variety, an improvement upon Papa Gontier. There were many very superior blooms of new H. Tea varieties. (Gold Medal.) Messrs. W. FROMOW & SONS, Nurserymen, Chiswick, staged a good group of Acers in variety, a well-bloomed plant of Raphiolepis ovata, and a capital lot of small plants of Kalmia latifolia. Mr. CHAS. W. BREADMORE, Winchester, staged a splendid collection of Sweet Peas. Messrs. T. WARE & Co., LTD., Feltham, staged an extensive collection of flowers of hardy perennials. (Gold Medal.) Messrs. J. PEED & SON, West Norwood, Lon-

don, S.E., showed Carnations, Roses, and hardy plants in variety. Mr. M. PRICHARD, Christchurch, Hants, showed extensively hardy perennials as cut flowers, among which were abundant blooms of Water Lilies, herbaceous Pæonies, &c. The Misses E. & M. KIPPING, Hutton, Essex, showed a small collection of hardy plants.

COLCHESTER ROSE AND HORTICULTURAL.

JUNE 26.—The summer exhibition of this society was held on this date in the Castle Park grounds, Colchester, an ideal spot for a flower show, and situated nearly in the centre of the town. Fortunately the weather was favourable. The Rose is the most prominent flower at this society's show, and some splendid blooms were staged, but in less numbers than usual. Considering the unfavourable season, the quality of the exhibits was good and the competition in the various classes was very close. Herbaceous flowers were very fine, especially the 24 bunches of these flowers from Messrs. R. WALLACE & Co.'s nursery, and the same firm showed a realistic piece of rockwork in a dell at the entrance to one of the tents, with Water Lilies. Fruit and vegetables were also good in quality, and the amateur and cottager classes were strongly contested.

Roses.—An important class was that for 48 blooms of distinct varieties. The 1st prize was won by Messrs. F. CANT & Co., Colchester, with magnificent blooms remarkable for their perfect shape and colour. 2nd, Messrs. B. R. CANT & SONS, Colchester; and 3rd, Messrs. D. PRIOR & SONS, Colchester.

Messrs. F. CANT & Co. also won the premier prize in the class for 18 Tea or Noisette Roses with exquisite flowers. 2nd, Messrs. PRIOR. In the class for 24 garden or decorative varieties of Roses, Messrs. B. R. CANT & SONS were awarded the 1st prize; 2nd, Messrs. F. CANT & Co. This last-named class provided some charming exhibits.

In the amateur classes for Roses, the chief was for 18 distinct varieties, and some grand flowers were shown. The premier prize was won by a successful amateur, Mr. O. G. ORPEN, Hill Side, West Bergholt, Colchester. 2nd, Mr. W. LEGGETT, Colchester. In the chief class for Tea Roses, the Rev. F. R. BURNSIDE, Great Stambury Rectory, Rochford, Essex, was 1st with grand blooms of Cleopatra; Mr. ORPEN followed, his variety being Souvenir de P. Notting, a little less developed than the premier flowers. 3rd, Mr. LEGGETT. In the smaller class for 12 blooms of a Tea Rose, Mr. ROLTS and Dr. PALLETT won in the order named. Classes were provided that were open to residents of the borough of Colchester only, the chief winners being Mrs. ELLIS, Major BUCKLE, Messrs. G. W. FINCHAM, DIGBY-OSBORNE, and Major KEMBLE.

Table decoration.—Decorated dinner tables were a great feature, and Roses were largely used for their adornment, especially beautiful being the single Roses; the tables in which Sweet Peas were used were also charming in appearance. There were 11 tables in all, and Mrs. O. G. ORPEN won the premier award with a delightful arrangement of single Roses. 2nd, Mrs. A. HITCHCOCK, who also used Roses. Miss A. F. HARWOOD was 1st in the class for a decorated stand or epergne. Miss KING showed the best basket of flowers, and Mrs. ORPEN the best bowl of Sweet Peas.

Medals were offered for the best Roses in their several divisions. Messrs. B. R. CANT & SONS secured the medal offered in the large class with flowers of Mrs. E. Mawley.

Mr. O. G. ORPEN took the medal for any variety other than Tea, with splendid trusses of Hugh Dickson; and the Rev. F. R. BURNSIDE had the best Tea in grand flowers of Cleopatra.

Herbaceous cut flowers.—Messrs. R. WALLACE & Co., Colchester, won easily in the class for 24 bunches, having splendid flowers that were well staged. 2nd, Mr. HARWOOD. In the smaller class for 12 bunches the Hon. W. LOWTHER, Campsea Ash, Wickham Market, Suffolk (gr. Mr. A. Andrews) had excellent bunches. 2nd, Mr. R. DOW. The best Pæonies were shown by Messrs. BUNTING & SONS, Colchester, and R. WALLACE & Co. in the order named.

The classes for Sweet Peas were strongly contested. Messrs. SALTmarsh & SON, High Street, Chelmsford, and Messrs. KING & Co., Coggeshall, were the principal winners in the large class, having fine flowers.

Fruit.—There was only one collection staged in the class for six dishes, and this was excellent. Hon. W. LOWTHER (gr. Mr. A. Andrews) was the exhibitor, and he had good Grapes, Melons, Peaches, Nectarines, and Strawberries. The same exhibitor was also 1st in the classes for Peaches, Nectarines and Melons. In the Strawberry classes were seen fine fruits of Leader, but in most of the classes Royal Sovereign was staged. Grapes were not of special merit: the Hon. W. LOWTHER had the best stand.

Vegetables were numerous displayed. Asparagus is always a feature at Colchester, and this year it was again very fine, Mr. A. J. HARWOOD having grand growths. Some splendid Potatoes, Peas, and collections of salads were also staged. Messrs. BOUND, STROWGLER, and MUMFORD were the principal winners in the vegetable classes.

Non-competitive exhibits were staged by Messrs. DOBBIE & Co., Rothesay (Sweet Peas), Messrs. ABBOTT, Ardleigh (Ranunculus), Messrs. R. WALLACE & Co. (hardy plants and cut flowers), Messrs. JOHN K. KING & SONS, Coggeshall; Messrs. ERNEST W. KING & Co., Coggeshall; Messrs. F. SMITH & Co., Woodbridge, and J. WILLIAMS, Ealing.

ROYAL AGRICULTURAL: LINCOLN HORTICULTURAL SECTION.

JUNE 25-29.—The Royal Agricultural Society held its annual exhibition at Lincoln on these dates, and in connection with the agricultural show proper a special and distinct horticultural section was provided in two large tents, under the secretaryship and general management of Mr. Peter Blair, who is to be congratulated on the success attending the undertaking.

The show proved a great attraction, and visitors came in crowds to inspect the flowers and the many beautiful plants exhibited.

The only prizes offered in competition were for groups of plants arranged for effect. Six groups were staged down the centre of the tent, thus giving a fine uniform appearance throughout. The 1st prize was won by Mr. W. HOLMES, Chesterfield, who used large Palms in the centre, and around were intermixed Codiaëums (Crotons), climbing Roses, and other flowering and foliage plants. The plants were well grown, and very tastefully arranged. Mr. SHARP, Huddersfield, was 2nd, with similar plants; 3rd, Mr. BLACKER, Selby.

Facing the entrance of the tent was a very fine group of foliage and flowering plants, exhibited by Messrs. JAS. VEITCH & SONS, Chelsea, to which a Large Gold Medal was awarded. The exhibit contained a choice selection of Cattleyas, Lælias, and other Orchids; an assortment of Cannas in flower; well-bloomed specimens of Exacum macranthum, a group of Kalanchoe flammea, backed up by Palms, Marantas, Crotons, and other foliage plants, with Nepenthes and other plants at intervals, the whole being most tastefully arranged. A collection of Carnations from the same firm was staged, and the new border variety, Leander, with flowers a shade of salmon, was especially prominent. Messrs. VEITCH & SONS also displayed a group of new Chinese climbing plants, including Vitis Henryana, V. Thomsonii, and Actinidia chinensis.

Messrs. CUTBUSH & SONS, Highgate, had a large collection of plants and cut flowers, amongst which were groups of Calla Elliottiana, Erica ventricosa magnifica, and E. Cavendishii; Carnations, Roses, a large number of herbaceous flowers, and a fine Codiaëum (Croton) named Rustic. (Gold Medal.)

Messrs. R. H. BATH, LTD., Wisbech, staged a beautiful display of Carnations, chiefly of the American or winter-flowering type, such as Mrs. Burnett (rose pink), Enchantress (flesh colour), Floriana (pink), Britannia (scarlet), Mikado (heliotrope), Lady Bountiful (white), Harlowarden (dark crimson), &c. Messrs. BATH also exhibited a fine lot of herbaceous Pæonies, Sweet Peas, and Roses. (Gold Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park,

Enfield, staged a choice collection of Carnations in the best varieties, including a plant of "Malmaison" Princess of Wales that was carrying 73 flowers. Amongst Orchids staged by this firm was a white Cattleya Mossiæ named King of Siam, also good specimens of the pretty Oncidium macranthum. (Gold Medal.)

Messrs. JAMES BACKHOUSE & SON, York, exhibited Roses, Carnations, Azalea rosæflora, Hydrangeas, Liliun Harrisii, and a fine new variety of Iris germanica labelled Lord of June. (Gold Medal.)

Mr. A. F. DUTTON, Iver, Bucks, staged a group of Carnations, chiefly of the American type. (Silver Medal.)

Mr. W. ARTINDALE, Sheffield, had a large collection of hardy herbaceous flowers, consisting of Irises Papavers, Pæonies, Pyrethrums, Allium Ostrowskianum (pink), Liliun rubellum, and others. (Gold Medal.)

Messrs. W. & J. BROWN, Stamford, displayed garden flowers of such kinds as Eremuri, Liliun Szovitzianum, Clematis integrifolia, Thalictrum Delavayii (a very pretty new herbaceous plant with pink flowers), Roses, Verbenas, Geraniums, &c. (Gold Medal.)

Messrs. DAVIS exhibited Begonias as cut flowers. (Gold Medal.)

Mr. W. SYDENHAM, Tamworth, staged Pansies, hardy flowers, &c. (Gold Medal.)

Messrs. HARKNESS & SONS, Bedale, Yorks, staged a large collection of hardy herbaceous flowers in great variety. Verbascum "Caledonia" (brown) was especially noticed. (Gold Medal.)

Messrs. GIBSON & Co. had very fine specimens of Aquilegia cœrulea and Geranium ibericum in an exhibit of herbaceous flowers that contained many other good varieties. (Gold Medal.)

Mr. GEO. MOUNT, Canterbury, staged a grand collection of Roses, both cut as flowers and as plants in pots. Amongst the cut specimens the varieties Mrs. J. Laing, Richmond, and Frau Karl Druschki were especially good. Climbing plants of Crimson Rambler, Dorothy Perkins, Blush Rambler, and others were trained above the main exhibit of flowers. (Gold Medal.)

Messrs. HILL & SON, Barrowfield Nurseries, Lower Edmonton, exhibited choice and rare Ferns. (Gold Medal.)

Messrs. BLACKMORE & LANGDON, Tiverton Hill, Bath, gained a Gold Medal for an exhibit of tuberous-rooting Begonias.

Mr. WATERS, Balcombe, showed Carnations, some of his best varieties being Elliott's Queen, Pride of Exmouth, Helen Goddard, Cecilia, and Fair Maid. (Gold Medal.)

Mr. JOHN ROBSON, Bowden, Manchester, displayed a pleasing group of Orchids, chiefly of Cattleyas, Cypripediums, Masdevallias, and Odontoglossum Alexandræ. Several of the Cattleyas were large, well-flowered specimens. (Gold Medal.)

Messrs. HEATH & SON, Cheltenham, exhibited Carnations in pots, grouped naturally on the grass. (Gold Medal.)

Messrs. WARE, Feltham, were awarded a Gold Medal for an exhibit of Begonias and Pæonies.

Messrs. BAKER, Wolverhampton, showed seasonable herbaceous flowers, and for which a Gold Medal was awarded.

Messrs. GILBERT & SON, Bourne, Lincolnshire, had a large exhibit of Anemones in variety. Those named Rosette and fulgens "The Queen" were especially pleasing. The same firm showed a collection of Sweet Peas. (Gold Medal.)

Messrs. ARTINDALE, Sheffield, exhibited floral designs. (Gold Medal.)

Messrs. R. PENNELL & SON, Lincoln, were awarded a Gold Medal for shrubs plunged in a natural style in the open.

The only exhibit of vegetables was a collection of upwards of 80 varieties from Lord ALDENHAM, Elstree (gr. Mr. Ed. Beckett). This was a most interesting and choice exhibit. (Gold Medal.)

Mr. BRADLEY displayed Roses of fine quality. (Gold Medal.)

Silver Medals were awarded to Messrs. BURCH, Peterborough, for Roses; Mr. JARMAN, Chard, for Roses; Messrs. BOYES & Co., Leicester, for Roses; Messrs. HOBBS, LTD., Dereham, Norfolk, for Roses; Messrs. COOLING & SON, Bath, for Carnations and Roses; and Mr. J. ILLMAN, Lincoln, for Carnations.

In the agricultural section of the show, Messrs. SUTTON & SONS, Reading, exhibited a collection

of grasses, roots, flowers, and other subjects of interest to the agriculturist and horticulturist. Messrs. DICKSON & ROBINSON, Cathedral Street, Manchester, showed grasses, forage plants, roots, flowers, plants, and seeds.

ROYAL METEOROLOGICAL.

JUNE 19.—The second of the afternoon meetings for the present session was held on the above date at the Society's rooms, 70, Victoria Street, Westminster, Dr. H. R. Mill (President) in the chair.

Mr. F. Campbell Bayard read a paper on "Weather and Crops, 1891-1906," in which he gave an analysis of the agricultural and horticultural tables which are included in the annual "Phenological Reports." He had sorted out the various crops into "good," "average," or "bad," for each district, and against each he had placed the temperature, rain and sunshine for the four seasons, and whether these statistics were above or below the average. In the paper Mr. Bayard gave tables showing the general results with regard to Wheat, Barley, Oats, Beans, Peas, Potatoes, Turnips, Mangolds, Hay, Clover, Apples, Pears, Plums, Raspberries, Currants, Gooseberries, and Strawberries.

A paper by Dr. C. P. Hooker on "The Relation of the Rainfall to the Depth of Water in a Well," was also read. The author gave the weekly measurements of the depth of water in a well 101 feet deep at Further Barton, Cirencester, compared with the weekly rainfall for the years 1903-1906. The results were very interesting, as they included the remarkably wet year 1903, and the dry summer and autumn of 1906.

SCOTTISH PANSY.

JUNE 22.—This society was instituted in 1844, and the jubilee of its formation was celebrated in 1894, but from various causes the annual shows were discontinued that same year. An effort has recently been made, under the presidency of Mr. James Grieve, of Redbraes Nursery, with his son, James C. Grieve, as secretary and treasurer, to revive the show, and by so doing to create greater interest in the cultivation of Pansies and Violas. Judging from the excellence of the show held on the foregoing date in the Free Gardeners' Hall, Picardy Place, Edinburgh, the efforts of the promoters have been very successful. Pansies and Violas furnish flowers of all shades of colour, and, being of dwarf habit, they lend themselves to purposes of decoration unsurpassed by any other class of plant. Interest in the show by exhibitors and visitors was gratifying and encouraging to the committee. The number of entries totalled 250. Messrs. DOBBIE & Co., Rothesay, staged an excellent non-competitive exhibit of these flowers. Mr. J. SMELLIE, Bushby, Messrs. A. LISTER & SON, Rothesay, and Mr. J. PAUL, Killearn, were prominent prize-winners in the nurserymen's classes; while in the amateurs' classes Mr. ROBERT DUNSMORE, Avonbridge; Mr. C. W. FRAME, Broxburn; Mr. W. WALLACE, Strathloanhead, were successful exhibitors. Mr. McKAY, Gargunnoch, won the 1st prize for 18 blooms of show Pansies in distinct varieties. Mr. PAUL showed the best 24 blooms of Fancy Pansies, and Mr. SMELLIE the best 12 blooms of these flowers. Mr. PAUL, Mr. McKAY, and Mr. SMELLIE were also successful in other classes. A special prize offered for any Fancy Pansy or Viola showing a break or novelty in colour was won by Mr. DOBBIE, Rothesay, with the variety Mrs. J. C. Grieve. The best bloom of a Fancy Pansy exhibited was the variety Miss Neil, shown by Mr. SMELLIE; and the best show Pansy was shown by Mr. C. W. FRAME in the variety George Mitchell. P. Z.

NATIONAL ROSE.

JULY 4.—The annual exhibition of the National Rose Society is being held as these pages are passing through the press. In most respects the display is up to the average merit. Hybrid Tea and Tea varieties furnish the finest blooms, but the largest flowers are seldom in perfect condition.

The nurserymen make a good competition in the larger classes, and in most of the amateurs' classes exhibitors are exceedingly numerous.

Forty blooms, distinct (trebles).—The 1st prize has been won by Messrs. B. R. CANT & SONS,

Colchester. In this competition the following are as fine blooms as could be desired, although all are not of the largest size:—Catherine Mermet, C. J. Graham, Duke of Edinburgh, La France, Tom Wood, Mme. Melaine Soupert, Mamie, and Lady Mary Fitzwilliam are among the finest shown. 2nd, Messrs. D. PRIOR & SON, Colchester, with a stand of fine blooms, some showing the effects of the weather.

Twenty-four blooms, distinct.—Mr. J. MATTOCK has a very fine stand of blooms, which are generally of large size and unblemished appearance, Ulrich Brunner, Marie Baumann, Aimie Cochet, Mildred Grant, Duke of Wellington being among the best. 2nd, Hy. DREW, Esq., who has fine blooms, the varieties Horace Vernet, A. K. Williams, Louis van Houtte, Rev. A. Cheales, Hugh Dickson, and G. Piganneau being the best flowers.

Twenty-four Teas and Noisettes (single blooms).—The 1st prize has been won by Mr. G. PRINCE, Longworth Nurseries, Oxford, with even-sized blooms, very good being those of Princess Beatrice, Medea, Maman Cochet, Mrs. E. Mawley, Golden Gate, and Madame Cusin. 2nd, Messrs. F. CANT & Co., Colchester, with smaller blooms.

Twelve Tea and Noisette blooms.—Messrs. J. BURRELL & Co. have been awarded the 1st prize for a very superior stand of flowers, Mrs. E. Mawley, Empress Alexandra of Russia, White Maman Cochet, Cleopatra, and Catherine Mermet being the finer varieties.

REPRESENTATIVE GROUPS.

In the nurserymen's class for a representative group of Roses, arranged on a space not exceeding 100 square feet, Mr. G. MOUNT, Canterbury, has won the 1st prize. Fine standards of the varieties Liberty, Hiawatha, Richmond, Frau Karl Druschki, W. J. Grant, Capt. Hayward, Alberic Barbier, Gardenia, &c., are prominent in the group. Immense numbers of Tea, Hybrid Tea, Polyantha, and climbing varieties make up the bulk of the exhibit.

A similar group of miscellaneous Roses is shown by Messrs. SPOONER & SONS, Woking, Surrey, who have obtained 2nd prize.

The most important class for groups of Roses is Class 16, and each exhibit is arranged on an area not exceeding 250 square feet. Messrs. HOBBS, LTD., Dereham, Norfolk, have been awarded the 1st prize for an exhibit composed chiefly of the showier varieties of the Rambler classes. The varieties Lady Ashton, Richmond, General McArthur, Margaret Dickson, La France, and Caroline Testout were very good. Messrs. PAUL & SON, The Old Nurseries, Chess-hunt, has obtained the 2nd prize for a group in the form of a half-circle, and containing Tea, Hybrid Tea, Hybrid Perpetual, Moss, Rambler, and other varieties. In some instances plants, and in others large bouquets of cut blooms were shown.

The prizes for 72 single blooms, and those offered in other important classes had not been awarded at the moment of going to press.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received and acknowledged in these columns. This box was last opened on May 23, and the secretary, Mr. Wynne, has handed us a receipt for the sum of £2 2s.]

Mr. J. H. PUCKERING, for the past 4 years Gardener to R. C. A. BECK, Esq., Bookham Lodge, Cobham, Surrey, as Gardener to J. B. MERCER, Esq., at the same place.

Mr. HERBERT ARNOLD, for the past 74 years Gardener to Mrs. D. EVANS, Dalewood, Mickleham, Surrey, as Gardener to C. B. SMITH, Esq., Denham Mount, Denham, Bucks.

Mr. COLIN ADAMS, for the past 64 years Head Gardener to the late F. ELKINGTON, Esq., Sion Hill, Wolverley, near Kidderminster, as Head Gardener to A. H. HARMAN, Esq., Lower Greyswood, Haslemere, Surrey. (Thanks for 1s., which has been placed in the R.G.O.F. box.)

Mr. R. FRASER, for the past 4 years Gardener to JULIUS G. MOSENTHAL, Esq., Staple Hall, Bletchley, Bucks, as Gardener to Sir BASIL MONTGOMERY, Kinross House, Kinross, N.B.

Mr. W. BROOMFIELD, for the past 4 years Gardener to Major D. P. CHAPMAN, Clare House, East Malling, Maidstone, Kent, as Gardener to B. V. MELVILLE, Esq., at the same place.

Mr. HUBERT BRAY, for the past 7 years Foreman in the Gardens at Langley Park, Slough, as Gardener to Lady HAWKE, Wighill Park, Tadcaster, Yorks.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending June 29, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was again cold and unseasonable, with a generally cloudy sky and frequent falls of rain. A thunderstorm, with heavy hail, occurred on Monday at Dublin, and on Saturday thunderstorms (locally of great severity) were experienced in many parts of England and at some Scottish stations. Snow was observed at Harrogate during Monday evening, while the electrical disturbances of Saturday were accompanied by hail in several places.

The temperature continued below the average, the deficit ranging from about 3.5° in England E. and the English Channel to about 6.5° in England N.W., Ireland N., and Scotland E. The highest of the maxima were recorded, as a rule, between Wednesday and Friday, and ranged from 70° in the Midland Counties to 63° in Scotland E. and Ireland N. The maxima were below 60° on one or more days at nearly every reporting station. The lowest of the minima, which were registered on rather irregular dates, ranged from 32° in Scotland E. (at Balmoral) to 40° in England E., and to 47° in the English Channel. The grass thermometer fell to 32°, or below in some Scottish localities, and also at Llangamarch Wells, Armagh, and Birmingham, the lowest reading being 27° at Balmoral.

The mean temperature of the sea.—The mean temperature showed an increase on most parts of the coasts, but at several of the Irish stations there was a decrease. The actual values ranged from about 58° at Margate and Eastbourne, and 56° at Newquay to about 51° on the east coast of Scotland, 49.4° at Lamlash and Burnmouth, and to 49.1° at Lerwick.

The rainfall was above the average in all districts except the English Channel, the excess being large in many parts of the Kingdom. As much as 1.37 inch resulted from the thunderstorm of Saturday at Fulbeck, and an inch or more was also measured in some parts of the metropolitan area. Early in the week some heavy falls were experienced in the N.W.; at Prestwick on Monday as much as 1.01 inch was collected in the gauge.

The bright sunshine was less than the average generally, but slightly exceeded it in England N.E. and Scotland E. The percentage of the possible duration ranged from 37 or 36 in the districts just named to 24 in England S.W., 25 in the Channel Islands, and to 22 in England S.

THE WEATHER IN WEST HERTS.

Week ending July 3.

Still cold and wet but not so windy. During June there were only two days which were unseasonably warm, and on two nights during the past week the exposed thermometer registered a temperature only 4° above the freezing point, which is a very low reading for the time of year. The ground still remains very cold, and is as much as 4° colder at 2 feet deep and 6° colder at 1 foot deep, than is seasonable. Rain fell on nine of the last ten days, but the amounts on each occasion were small. For a fortnight no rainwater at all has come through the percolation gauge on which short grass is growing and only a few drops each day through the bare soil gauge. The sun shone on an average for less than 8½ hours a day, or for only about half the usual duration at this season. The wind has not been so generally high as during the previous weeks, but from whatever quarter it came the air remained cold for the time of year. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 11 per cent. E. M., Berkhamsted, July 3, 1907.

SCHEDULES RECEIVED.

WEST LONDON HORTICULTURAL SOCIETY'S exhibition, to be held on October 31, in the Town Hall, Hammersmith.

SALTAIRE SHIPLEY AND DISTRICT ROSE SOCIETY'S exhibition, to be held in Saltaire Park, on Tuesday, July 16, 1907.

HEREFORD AND WEST OF ENGLAND ROSE SOCIETY'S 41st annual exhibition, to be held in the Shire Hall, Hereford, on Wednesday, July 10, 1907.

The schedule of the Rose show of THE ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER AND THE WHITE CITY contains several classes for decorative and single Roses which will be a novelty at the Manchester show. Prizes will also be given for groups of Roses and for arches of Climbing Roses. The show is to be held at The White City, late the Royal Botanical Gardens, on July 23.

CATALOGUES RECEIVED.

JOHN COWAN, Gateacre Nurseries, Gateacre, near Liverpool.—The "Bonis Hall" collection of Orchids.

GEORGE BUNYARD & Co., Ltd., the Royal Nurseries, Maidstone.—Strawberries, Grape Vines, Figs, &c.

FOREIGN.

M. HERB, Naples, Italy.—Bulbs and Seeds for Autumn sowing.

DAMMANN & Co., San Giovanni a Teduccio, near Naples, Italy.—Bulbs and Flower-roots.

DEBATING SOCIETY.

CARDIFF GARDENERS'.—A meeting of this association took place on June 19, when a purse of gold, &c., was presented to Mr. John Julian, on his resignation as hon. sec., a position which he has filled for the last 10 years. Mr. E. H. Battram, of Abercynon, made the presentation, and said that Mr. Julian had carried out the secretarial duties in an efficient manner. Mr. Julian thanked the members for their kind thought and the tangible manner in which they had shown their appreciation of his services. A. F. W.

MARKETS.

COVENT GARDEN, July 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

REMARKS.—The supplies of English Peaches and Nectarines are larger, but there is not a good demand for these fruits owing principally to the large quantities of Strawberries on the market. Prices of English Tomatoes have further advanced, and are selling freely. Strawberries are now very plentiful, but they are of poor flavour and quality owing to a continued absence of sunshine. The last consignment of Australian Apples for this season has arrived. P. L., Covent Garden, July 3, 1907.

POTATOES.

Kent's 7. 6d. to 10s.; Bedford's, 7s. to 8s.; Jersey's, 7. 6d. to 8s.; St. Malo's, 8s.; Cherbourg's, 7s.; Tenerife's, 6. 6d. to 7s.; old Potatoes, 7s. 6d. to 8s. A fair quantity of new English Potatoes are on the market. It is expected that supplies from Jersey will finish this week. A. B., Covent Garden, July 3, 1907.

COVENT GARDEN FLOWER MARKET.

At the end of last week there was a slight advance in the prices of some cut flowers. *Lilium longiflorum* was dearer, but I find this morning these flowers are cheaper again. *L. lancifolium* of the best quality is not over plentiful. Good blooms of *L. tigrinum* are making higher prices than those of *L. longiflorum*. Callas may realise fair prices one morning but the next day they are not wanted. The market has received Sweet Peas from under glass for the past two months, and, now those from the open are in, the public is tired of them. Roses vary considerably; a few of the best quality blooms make good prices. Carnations are over-plentiful and are sold by hawkers in the streets for very little money. Paeonias are seen in large quantities; a few of the pure white, bluish, and pink coloured varieties sell well, but the old double crimson flowers are disposed of for very low figures. Poppies are abundant; the improved Iceland varieties sell best, but the Shirley Poppies are also good. Herbaceous Pyrethrums are abundant; the single crimson and the double white kinds are the most appreciated. *Gypsophila elegans* is arriving in whole van loads. Eucharis, Stephanotis, *Lapageria alba*, white Pelargonium, Tuberoses, &c., are all well supplied, but flowers with short stems have depreciated in value. There is no lack of cut foliage of all description.

POT PLANTS.

Several growers have cleared their stocks of some subjects for the season, and special orders may be difficult to execute, but up to the present supplies have been abundant. Zonal Pelargoniums have fallen in value, but good Ivy-leaved varieties have been in demand. Show or Regal varieties are still over-plentiful. *Crassula coccinea* is very good; *C. jasminea* and hybrid varieties are also on sale. *Hydrangea Hortensia* can be had in plants of all sizes up to those 3 feet high, and with about a dozen good heads of bloom. *Verbena "Miss Willmott,"* Fuchsias, yellow and white Marguerites, yellow Calceolarias, and Mignonette are prominent flowering plants seen on the stands. *Chrysanthemum segetum* forms a good pot plant, but it is over-plentiful. Some growers of Rambler Roses have cleared their saleable stocks for the season. Good prices have been generally maintained; shapely and well-flowered plants of the variety Dorothy Perkins have realised two guineas a pair. Ferns are well supplied in all sizes. Palms vary but little, they are generally procurable in all sizes. Some well-grown plants of *Pandanus* are seen. *Ficus elastica* is good, but the demand for this old favourite parlour plant has fallen off considerably. *Aralia Sieboldi* and the variety Moseri are selling at advanced prices. *Asparagus Sprengeri* is now extensively used for florists' work. *A. H., Covent Garden, Wednesday, July 3, 1907.*

TRADE NOTICES.

MESSRS. A. T. SIMS, LTD.

A company with this title has been registered with a capital of £5,000 in £1 shares, for the purpose of acquiring the Kingsfield Nursery business lately carried on by Mr. A. T. Sims, at Sewardstone Road, Chingford. There will be no initial public issue of the shares, and the company will be registered without articles of association.

MESSRS. W. DENNIS & SONS, LTD.

The above-named company has lately been registered with a capital of £75,000 in £1 shares, for acquiring the potato, fruit, seed, and other businesses of Messrs. W. Dennis and Sons and Messrs. J. and H. Dennis. There is no initial public issue of the shares. The first directors are W. Dennis, J. W. Dennis, J. M. Dennis, J. H. Dennis, T. E. Dennis, and F. W. Dennis.

MR. WILLIAM N. LINDSAY, LEITH.

Mr. Alexander Cross, who has severed his connection with Messrs. Bell & Bieberstedt, has entered the firm of Mr. William N. Lindsay, as partner. A department for the wholesale seed business has been added to the firm, and of this branch Mr. Cross will assume the management.

ANSWERS TO CORRESPONDENTS.

BOTANICAL PERIODICALS: *S. S. A. Botanical Magazine*, published by Messrs. Lovell, Reeve & Co., Ltd., 6, Henrietta Street, Covent Garden, W.C.; *Journal of Botany*, West, Newman & Co., 54, Hatton Garden, E.C.

BUTTERCUPS ON LAWN: *W. H.* You cannot do better than treat the grass with the dressings you mention. The nitrogenous manures will favour the growth of the grasses, and in time they may be expected to crowd out the weeds.

CARNATION LEAVES DISEASED: *Ireland.* The injury is called Bacteriosis, and is primarily due to punctures by aphides. Bacteria gains an entrance into the tissues of the leaf through the wounds set up by the aphides and this causes further trouble. Aphides should be kept down by spraying with some suitable insecticide.

CARNATION ROOTS: *Mack.* The white insects on the roots are known as *Rhipisia terrestris*. Bisulphide of carbon will destroy them. Make holes with a piece of stout wire in the soil, and use two teaspoonfuls of the chemical to a 6-inch pot. Afterwards shade the plants. The substance is poisonous to animal life, and highly inflammable.

CUCUMBERS DISEASED: *W. X.* Your plants are affected with the spot disease. See answer to *J. C.* in our issue for June 22, p. 416.

DIGITALIS FLOWERS: *F. E. S. & Co.* This abnormal form is by no means uncommon. It

is known as regular peloria, and is often seen in the Toadflax, *Antirrhinum*, and many other flowers.

FRUIT RECENTLY FUMIGATED: *Anxious.* We have never heard of any injurious effects following the consumption of fruits that have been gathered from trees that had been recently fumigated with tobacco smoke. In the case of fruits from which the skin is removed before consumption, no bad effects could possibly follow.

GARDENING IN THE UNITED STATES: *R. J. H.* See articles on this subject in our last volume, pp. 80, 191.

GARDENIA AND AZALEA SHOOTS DYING: *Kent.* The shoots have the appearance of having been injured by some external influence such as excessive fumigation, or an application of too strong an insecticide. Without knowing all the circumstances, we are less able to judge of the cause than those on the spot.

GRAPES: *H. E.* There is no fungus disease present in the berries. The cause of the failure is probably due to some cultural defect. We suspect that the trouble exists at the roots; see that the borders are in a satisfactory condition.

HOLLY LEAVES: *R. A.* The damage is caused by the grub of a fly. You can do nothing in the case of those leaves which are already infested, but by spraying them with quassia extract you will render them distasteful to the adult insects, and so prevent the insects depositing further eggs on the foliage.

LILY DISEASE: *A. H.* See reply to *G. O. P.* in our issue for June 22, p. 416.

LUPINS DROPPING THEIR BUDS: *W. U.* The trouble is caused by a fungus, *Sclerotinia sclerotium*, that attacks the roots. The soil in which they are growing should be treated with quicklime, or, better still, with gas-lime, after the plants are removed. If your stock is not extensive, we advise the destruction of the plants by burning, and the planting of healthy roots on a different quarter of land.

MUSCAT OF ALEXANDRIA GRAPES: *G. S.* Allow the vines to remain without disturbance until the resting season, when they should be lifted, and the borders thoroughly overhauled. You will gain nothing by planting out young vines at this late season, and in any case we should advise an inspection of the interior of the border. The wire worms can be trapped with portions of some vegetable roots, such as Carrot or Potato.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.* **PLANTS:** *A. H.* *Pentstemon glaber* and *Erigeron philadelphicus*.—*A. E. E.* 1, *Cephalanthus pallens*; 2, *Atropa Belladonna*; 3, *Cynoglossum officinale*; 4, *Verbascum nigrum*.—*O. W.* *Libertia formosa*.—*H. L.* 2, *Habenaria conopsea*.—*H. K.* *Silene nutans*.—*A. P. N.* 3, *Campanula ramosissima*.—*W. D. M.* *Ceanothus Veitchianus*.—*Bids.* We are unable to name the leaf received from Ceylon in the absence of further material. The shrub is *Santolina Chamæcyparissus*.—*F. S.* 1, *Podocarpus Totara*; 2, *Cephalotaxus pedunculata* var. *fastigiata*; 3, *Iris versicolor*; 4, *Salix triandra*; 5, *Aristolelia Macqui*; 6, *Anemone pennsylvanica*.—*C. L. L.* We are only able to give the name of one of your Roses, No. 6, *Reine Marie Henriette*. Send them direct to a nurseryman who has the opportunity to compare them with other flowers.—*R. W. P. & S.* *Dictamnus fraxinella*.—*A. H.* *Polygonum sachalinense*.—*K. F.* 1, *Deutzia crenata*; 2, *Azara microphylla*; 3, *Cyperus longus*; 4, *Orchis pyramidalis*.—*Palmer.* *a*, *Weigela rosea*; *b*, *Crataegus pyracantha*; *c*, *Leycesteria formosa*; *d*, *Centranthus ruber*;

e, *Potentilla "Hamlet"*; *f*, *Erigeron philadelphicus*.—*M. & M.* *Olearea macrodonta*.—*G. M.* 1, *Swainsonia galegifolia*; 2, *Astrantia major*; 3, *Bletia hyacinthina*; 4, *Potentilla sanguinea*, garden variety; 5, *Centaurea montana alba*; 6, *Lilium Martagon*.—*H. L.* *Franciscea (Brunsfelsia) acuminata*.—*V. J. T.* 1, *Odontoglossum Lindleyanum*; 2, *Oncidium caesium*; 3, *Aerides japonicum*; 4, *Masdevallia swartzifolia*; 5, *Stelis muscifera*; 6, *Oncidium triquetrum*.—*H. A., Notts.* *Begonia incarnata metallica*.—*J. B., North Wales.* 1, *Lælia purpurata*, a very good variety; 2, *Dendrobium Calceolaria* of the variety often called *D. moschatum*; 3, *Libertia formosa*; 4, *Saxifraga umbrosa serratifolia*; 5, *Saxifraga trifurcata*; 6, *Lysimachia nemorum*.—*E. C. C. D.* *Limnanthes Douglasii*.—*S. W.* Probably a *Daphne*; send again when in flower. —*W. P.* We do not undertake to name varieties of Roses.

PAULOWNIA IMPERIALIS: *W. N.* This is a handsome, hardy, deciduous tree, not uncommon in borders in gardens, where its stately broad foliage forms a suitable background to flowering plants. In warm and sheltered localities it blooms early in the season, producing terminal panicles of pale violet-coloured flowers. The points of the shoots usually suffer injury from spring frosts, in English gardens, but in seasons when the trees are able to expand their flowers, the Paulownia is exceedingly effective. It was introduced from Japan nearly 70 years ago. The genus possesses this species only, and belongs to the natural order Scrophulariaceæ.

PEAR SHOOTS INJURED: *J. P.* The branches are dying as the result of a fungus disease known as brown-rot. Cut out the diseased shoots, well below the seat of injury and burn them.

QUINCE SEEDLINGS: *E. B.* You may use these as stocks for grafting varieties of the Pear.

RASPBERRY FRUITS, ETC.: *Miss P.* The failure of the Raspberry fruits is due to imperfect fertilisation of the flowers, probably the result of the wet season. The Rose leaves are attacked by a fungus, *Asteroma roseæ*. Collect and burn all diseased leaves and spray the healthy ones with liver of sulphur, using one ounce of the sulphur in two gallons of water.

SPOT DISEASE OF GRAPES: *R. G. M.* The berries are affected with the spot disease, which is caused by a fungus *Gloeosporium ampelophagum*. Dust the bunches with a mixture of one part quicklime and two parts of flowers of sulphur. The use of stable manure in the border favours the disease.

STAND FOR EXHIBITING GRAPES: *S. W.* We know of no regulation size for a stand to hold two bunches, but those usually adopted for this number are from 12 to 15 inches in length, about the same measurement in depth, and about 12 inches in height.

TOMATO DISEASE: *S. W. W.* It is advisable to obtain fresh seeds from healthy plants.

TOMATO FRUITS WITH UNRIPENED PATCHES: *F. W. H.* The blotches and hard patches are due to an absence of potash in the rooting medium. Dress the soil with light sprinklings of sulphate of potash and afterwards well water the roots.

TOMATO LEAVES: *H. R.* This condition is brought about by excessive feeding and watering. The plants have grown with too much vigour, and have expended their energies in the formation of shoots and leaves instead of fruits. The leaves have become more or less succulent and hence their brittle nature. Tomato plants should not be too liberally watered at their roots, and if their root-run is somewhat restricted, so much the better.

VINE LEAVES FROM THE OPEN: *J. P.* There is no disease present; the injury has been caused by chills which have arrested the growth of the foliage.

YEW TREE AT WARBLINGTON: *F. R.* The tree is mentioned in *Lowe's Yew Trees of Great Britain and Ireland*. You may send the picture for our consideration.

CHOICE VARIETIES OF BRITISH FERNS.

I PROPOSE in this article to write mainly of choice varieties of British Ferns that I have either found growing wild, or that have been raised by myself from spores during the course of some 30 years of Fern-study and culture. It has too frequently been my lot to pronounce very disappointing verdicts on sports or quasi-sports submitted for my opinion, learning later, in some cases, that my reputation as a judge had been utterly shattered thereby in the opinion of the raisers of the presumed "gems." In the following remarks, it is perhaps unfortunate that I am a self-elected judge of my own favourites, but I must plead that, so far as I know, my favourable verdicts have been backed by all who are best qualified to judge. In the first place, then, I will put *Blechnum spicant concinnum* (Druery), because it was my first good find in 1881, and it still stands unrivalled in its particular class. The common *Blechnum* or Hard Fern has once-divided fronds, with a lance-shaped outline, that is, they are narrow

at the bottom, with short side divisions, which gradually lengthen towards the middle and taper rapidly to a blunt top. My variety, that I found coyly hidden, all but the tip of one slender frond, in a mass of seedlings in a roadside dyke on Exmoor, has fronds of the same width from end to end, all the side divisions being reduced to round saw-toothed discs like scallop shells, of which each frond imitates a string. About an inch of such a string was displayed to view in a bunch of ordinary fronds, and on tracing this to its source, six perfectly characterised fronds springing from one centre indicated the discovery of an unique and fixed variety, whence I immediately contracted an attack of Fern fever, which soon became incurable. I did not proceed, as some persons would have done, to cut off these fronds for herbarium specimens, and thereby destroy the find, but lifted the whole plant carefully, wrapped the roots in damp moss, and in course of time obtained a fine, robust, and typical specimen, which produced fertile fronds with spores, and these furnished me with several hundred plants, all of which were true to the new type. Since that time about a dozen different varieties of the same species have fallen to my lot; in one or two of these the narrow saw-toothed character is partially developed, but not one is equal to my original plant in this characteristic. In the Lady Ferns (*Athyrium filix fœmina*), I have been more fortunate, both as a finder and as a raiser of novelties. *A. f. cristatum* Kilrushense is by far the most beautiful wild-ling of all its congeners yet found; its long, graceful pendulous tassels having countless strands. The finding of this Fern at Kilrush, in Ireland, was quite by accident. Imagine a square ditch for drainage, a yard deep and as much wide, the sides clothed with *Blechnums* and other Ferns, and the top covered in with Brambles, Bracken, &c., so that it was just possible to creep along below these and inspect the Ferns beneath. Two youngsters, my guides, for I had only just arrived, make their way along the outside of the ditch and, out of sight, one of them says something to me which I cannot quite hear, and somewhat impatiently I stop, push aside the Bramble and Bracken aforesaid to get near enough to hear, and in this gap, on the outer side, is a poor, little, crushed Lady Fern. I do not hear what the child says, for I instantly note the tassels and recognise a fixed variation, though how good it was I did not know until two years later, when, after a spell of stunted growth, due possibly to damage, it became a robust, full-sized specimen, pronounced by other and better judges than myself, an easy first among wild forms, and unique in its way amongst those obtained by selection. Col. Jones, one of the pioneers of British Fern culture, had a pretty fancy that a good fairy always attended the conscientious Fern-hunter, and if he were otherwise unsuccessful, would create a "sport" for his delectation, and in the case of the plant just cited, it would certainly seem as if such a fairy had inspired the child's remark, to which the discovery was undoubtedly due. My next unique example is also a Lady Fern—*A. f. revolvens*—and in this the side divisions turn back so that the frond forms almost a tube.

The side divisions themselves are convex,

and all their tips, as do those of the fronds themselves, turn spirally, ringlet-fashion, with charming effect. Here, again, fortune favoured me in its discovery. I was stopping at a cousin's house in Scotland, lamed with a sprained ankle. Ordinarily, when starting on a Fern-hunting expedition, I make straight for good ground at a distance, but, being lame, I could only hobble with the aid of a stick a hundred yards or so from the house, the result being the discovery of this beautiful form in a gully close by, where two beautiful, curly fronds peeped out below a mass of commoner ones. *Lastrea montana cristata gracilis* (Druery), a graceful crested form of the Lemon-scented Fern, fell to my lot in a manner I have too often described to repeat here in detail. Suffice to say, the clump of crowns (33) weighed about 1½ cwt., and had to be lifted by two men and conveyed by a horse and cart to the Dartmoor village where I was stopping. The foregoing varieties represent what I consider to be the choicest of my wild "finds," but I have discovered many others, all interesting certainly, but more on the lines of existing forms. I will confine my remarks to what has been done in the direction of cultural selection. I have been peculiarly favoured, and that quite unexpectedly, by the sudden sporting of my plants. My strain of Lady Ferns of the plumose superbum type in two generations utterly eclipsed anything previously known in the species. A finely-cut, uncrested Lady Fern (*A. f. plumosum elegans* Parsons), a descendant of *A. f. Axminster plumosum*, yielded a batch of seedlings that were all crested save two, and the best of the crested ones gave two sections of descendants, the one crested, the other plain, both simply exquisite plumose forms, which require to be seen to be appreciated. The sowing resulted in at least a score of distinct varieties, and the whole batch formed one of those unanticipated triumphs which occasionally so richly reward the observant cultivator. A person who has not experienced it cannot comprehend the pleasure of watching such plants develop from the first promise noted by a keen eye in the early fronds, and the gradual fulfilment step by step in the later ones, each creating a fresh surprise and delight, until the final perfection of a full specimen is reached. With the wonderful Shield Ferns (*Polystichum*) I have not been very successful as a finder of rare forms, but it has been my good fortune to have novelties raised from spores, and these, again, in a very unexpected fashion. In 1874 a farm labourer found a Shield Fern (*P. aculeatum pulcherrimum*) in a hedge near Dr. Wills' house in Dorset. Dr. Wills was an assiduous and successful Fern-hunter, and had, as he presumed, exhausted the varieties in his immediate vicinity. Yet this Fern, which surpassed anything he had found himself, was dragged out of the hedge close by and brought to him, because, as the person who found it said, it seemed "funny," or words to that effect. From that time, and until three or four years since, it was deemed to be perfectly barren, and its long, slenderly-divided fronds, with peculiarly gracefully overlapped tips, did not seem to possess the capability of bearing spores. Some years

ago I gave part of my plant to my neighbour, Mr. C. B. Green, who treated the division so well that a huge, robust plant resulted, upon which Dr. Stansfield and myself discovered some spores. These were gathered and sown by both Mr. Green and myself, with the result that a batch of very beautiful plants has resulted. Amongst the brood are some four or five reversions to the ancestral form, one or two promise to resemble the parent, but the majority promise to excel it in beauty. Some half-a-dozen of these seedlings have fronds of such a delicate silken and attenuated division as to resemble

DIOSPYROS KAKI.

THERE are good reasons for believing that the Japanese Persimmon or Date Plum, *Diospyros Kaki*, is a hardy tree in the warmer parts of the British Isles, if not in every part where good Apples can be grown. For some reason or other it has been treated as being too tender to thrive out-of-doors, but there are now young trees outside at Kew, which have stood the cold of the last two winters without injury. When *Aucuba japonica* was first introduced to this country it was grown under glass, and 25 years ago there was a collection of named varieties of it in the temperate house at Kew. Professor Sargent holds that the *Kaki* is much hardier than is commonly supposed. He suggests that certain

(see fig. 9). The female flowers (see fig. 8) are yellow, with a green calyx, and they are followed by fruits without fertilisation, there being no male plant at Kew. There is, therefore, no seed, the whole of the contents of the thin, tough skin of the fruit being, when dead ripe, a mass of soft, juicy, sweet, strong-flavoured pulp, requiring a spoon to eat it with comfort. The treatment afforded the Kew tree is the same as that recommended for Peaches. It has fruited every year for the last 13 years. The fruits hang on the tree till April, although they are fully grown and appear ripe in October, when the flesh is still hard. Professor Sargent says the Japanese eat the fruits when they are as hard as paving stones! W. W.

FIG. 8.—FEMALE FLOWERS OF *DIOSPYROS KAKI*, FROM A PLANT GROWING IN THE SUCCULENT HOUSE, ROYAL GARDENS, KEW.
(Floral details magn. 4.)

nothing in the genus hitherto seen. One of my own raising may justifiably, I think, be regarded as the best of the batch, and I propose to christen it *P. aculeatum gracillissimum*. Some of the others, instead of having this gracile character, are greatly improved types of the parental form, so that in this case, as with the Lady Ferns, a new breed or strain has been the reward of sowing a minute and practically invisible pinch of spores, derived, be it noted, from a thoroughbred plant. Chas. T. Druery, V.M.H., F.L.S.

varieties that may have originated in the warmer parts of Japan, when introduced into Europe and the United States, proved tender; but that the varieties grown in Pekin and Central Japan would be capable of thriving in a lower temperature. It is certainly worth the while of fruit-growers in this country to try them, for the tree is decidedly handsome, particularly when covered with large peach-like fruits, and the fruit itself is excellent for dessert.

There is a small tree of *D. Kaki* in the succulent house at Kew, which fruits every year, the fruit being of the size and colour of a large first-class Tomato of the "Conference" type

THE CULTIVATION OF STRAWBERRIES.

THIS fruit has been cultivated from time immemorial, and many details of culture have been handed down from past times, garnished probably with much that is hypothetical, yet with many a maxim that modern cultivators may well heed.

A rich, fairly heavy loam on a gentle slope forms a favourable rooting medium for the Strawberry. Land from which a winter crop has been taken should be deeply trenched in May, and be dressed with one cubic yard of fresh farmyard manure to every 108 square yards of

ground, but if the preceding crop has exhausted the soil, add one-third more dung. The ground should also be enriched with three barrow-loads of wood ashes from the garden fire, and half this quantity of old pounded lime rubble. It is important that the digging should be thorough, and the whole of the manure, ashes and lime, evenly and thoroughly incorporated with the soil. Ply the hoe in fine weather to destroy any seedling weeds which may appear.

In preparing the layers, use clean pots, and

plants from their parents, and before doing this see if any roots protrude from the bottom of the pots, for the presence of these may be taken as a guide in severing the stolons. At this period the ground which is to receive the young plants must be thoroughly hoed, and if it is not pretty firm it must be rolled or trodden to consolidate it. Plant in rows placed two feet apart, but first ascertain that the plants are not dry at their roots. Put the plants at two feet apart in the drills. When planting, see that the soil is pressed firmly

good rotten farmyard manure or fowls' dung—pigeons' dung is spoken very highly of for this crop, but I have never used this substance for Strawberries, so cannot confirm the statement. When the flower trusses appear, place a wisp of straw beneath them to keep the fruits clean, and to prevent them being injured by rains. In these gardens the plants are not retained after they have been planted two years. They fruit well the first year under the above treatment, and in the second year also. After the first fruiting

FIG. 9.—FRUITS OF *DIOSPYROS KAKI*, VAR. *COSTATA*, GROWN IN THE ISLE OF WIGHT. (See page 22.)

fill them with loam made mellow by the addition of some sifted leaf soil. If enough ground is available, it is an advantage to have separate plants for the purpose of providing runners only, and these stock plants should have their flower trusses removed. Plunge the tiny pots to their rims, and with pegs made from bracken fasten the young growths in the soil of the pots. If the weather is dry, occasional waterings must be given. Do not separate too early the young

around the "ball," which should be placed at a proper depth in the soil. It may be necessary to afford water after planting, but in any case, first level the ground by hoeing or raking out the footmarks. Keep down weeds by the use of the hoe, and pinch out all runners. In October afford a dressing of 28 lb. of fresh superphosphate on every 108 square yards of land, and either hoe or lightly fork it in with a fork. At the latter part of February apply a mulch of

season the ground is cleaned, a sprinkling of superphosphate is given in October and a heavy mulching of manure in February. With regard to the question of varieties, Royal Sovereign is our best kind; Sir Joseph Paxton, President, and Sensation are also in favour here. For forcing we use the first-mentioned variety, and the plants are layered direct into 6-inch pots and kept actively growing for as long a period as possible. H. W., *Trevince*.

FOREIGN CORRESPONDENCE.

POLYGONUM BALDSCHUANICUM.

WITH reference to a note published on p. 399, vol. xli., respecting this useful plant, I would say that it has for years been grown in Switzerland, and there attains to a considerable size. It flowers, not merely after June, but from the middle of April until the end of autumn.

I have a plant of this beautiful Turkish species that covers a large surface, and has been laden with blossoms since April 12; a few days ago we gathered some ripe fruits from it. It is sometimes stated that these seeds are not capable of germinating, but this is not true, for few seeds germinate as well and rapidly as do those of *Polygonum Baldschuanicum*, provided that they are sown directly after they are gathered. I have raised thousands of plants from seeds sown in autumn as soon as ripe, or early in spring. The fact that this is seldom done is the reason for the belief that seed-raising is difficult.

ERITRICHIMUM NANUM.

THE cultivation of this plant has for years been a subject of discussion in the English horticultural Press. I have often proved the possibility of raising *Eritrichium nanum* from seeds and flowering it in England. Some years ago I saw in the garden of Sir Charles Ellis, at Haslemere, two pans of the *Eritrichium* in full bloom and perfect condition. They were seedlings raised on a hot-bed and kept dry in a cool house. We have now, at Floraire, seedling plants of *Eritrichium* which interest many, and I shall be pleased to show them to any English visitors who may come here this summer. Floraire is twenty minutes' tram ride from Molard, Geneva. There is no time to be lost by those who would see our *Eritrichium* and the wall planted with Alpines now in flower. H. Correvoon, Floraire, Chêne-Bourg, Geneva.

COLONIAL NOTES.

ORANGES FROM AUSTRALIA.

THE *Sydney Mail* for May 22 last states that it was proposed to ship 4,500 cases of citrus fruits to London from Sydney by the R.M.S. "Orontava," on June 29. At a recent meeting of fruit-growers in Sydney, it was stated that there would be a prolific crop of Oranges this season, and probably prices locally would be very low. A large quantity of the yield will be available for export, and as the consignment will reach London at the best time for exporters, namely, when the market there was bare of citrus fruits, the prospects of good returns were regarded as very bright. Fruit-growers, however, have not made much response when called upon to assist the movement. In the past, some of the consignments of citrus fruits to England have been failures, and others have given good financial returns. When the fruit was landed in good condition, the shippers have realised up to 18s. for a case of about 150 Oranges. The A. F. and P. Company will make all the shipping arrangements, and the cases will be practically what are known as the bushel size, as they will hold 150 Oranges 2½ inches in diameter. It is desired that only clean fruit of the best quality, and graded so as to have no variation in size in a case, should be sent. When clipped, the fruit, it was recommended, should be showing the ripening colour, in preference to being on the green side. The freight charge will be 65s. per ton, equal to 3s. 1d. per case. The cost of the cases will be 9d. each. The opinion was expressed that the temperature in the steamers' cool chamber should be maintained at from 40° to 50°. The packing and wrapping of each

Orange with wax paper, and stowing on the ship would have to be carried out carefully. This precaution, it was considered necessary, as one agent, who spent a day on a wharf watching the shipping of fruit, said he saw some cases knocked about on the wharf as if they were merely old boots. The grower will be charged 3d. per case.

THE USES OF LIME.*

THE effect of lime when applied to garden soils is often so beneficial to future crops, we reproduce the following information on the uses of lime in agriculture, recently issued by the Board of Agriculture and Fisheries. Owing to the intensive culture practised in gardens, and the frequent applications of farmyard and other manures they receive, occasional dressings of lime are essential.

"The practice of liming or chalking the soil is one of the oldest and most widely-spread operations of British agriculture; unfortunately for many districts, it is a custom that is less observed at the present time than probably at any other period since farming became an organised industry. Until about 40 years ago lime was much more extensively used in agricultural practice than it is to-day.

How is it that the practice of liming has fallen so much into disuse? It may be said that, in the main, it is due to (1) increased cost of labour; (2) the increased use of artificial manures; (3) the reduction in the value of corn crops. Several common manures contain lime, but a clear distinction must be drawn between free lime, as it exists in quicklime or slaked lime, and the same combined with an acid, as in bones, where it is combined with phosphoric acid, or in gypsum, where it is combined with sulphuric acid. What is necessary for the soil is not so much the chemical substance lime, but a base, i.e., something capable of combining with the acids produced naturally or artificially in the soil. In quicklime or in slaked lime this base is found, and nothing else. Chalk and all natural limestones contain lime combined with carbonic acid, which, however, is so weak and acid that it is easily turned out and does not interfere with the basic properties of the lime, whereas in bones or gypsum the lime is already completely saturated with strong acids, and in superphosphate there is even an excess of acid, which demands more lime from the soil to neutralise it.

Quicklime and slaked lime when applied to the soil quickly go back to the state of carbonate of lime or chalk in which they existed before they were "burnt" in the kiln, hence it is really this substance, carbonate of lime, that we denote when we speak of "lime" in the soil. The superiority of burnt lime over chalk or limestone for application to the soil lies simply in the fact that it falls naturally into a fine state of division, some of it also passing into solution, so that it is more easily disseminated throughout the soil and acts with greater rapidity and in smaller quantities. But to return to the point in question, only freshly burnt (quick) or slaked lime, chalk, limestone, marl and basic slag contain "lime" in the farmer's sense, i.e., in the form of a base capable of neutralising acids; in bones, in superphosphate, and in gypsum the lime is combined with acids, and is no longer capable of acting as a base.

Besides its indirect value in neutralising acids in the soil lime has several other uses, all of which are of importance to the farmer (and gardener). These uses may be given as follow:—

1. Lime improves the nature of the soil by coagulating the finest particles of clay and

rendering the land more open and friable. Thus drainage goes on more readily, the land is warmer, and it is more easily worked to a good tilth. It is difficult to exaggerate the value of this action of lime on the heavier soils; it is frequently possible to secure a seed bed when the unlimed land is still too wet to work, and the character of the crop may depend as much upon securing a good tilth as upon manuring.

2. Lime is an essential plant food, and without it soils cannot produce good crops. Soils are generally considered to be deficient in lime when they contain less than from .5 to 1 per cent. Some soils, however, which are provided with a considerable amount of organic matter may respond to lime although they contain much more than these amounts.

3. The insoluble reserves of nitrogenous and potassic material in the soil are brought into action and rendered available for the plant by the presence of lime. The following table shows the result of applying in January, 1903, 2,000 lb. per acre of ground quicklime to some of the grass plots at Rothamsted, where there was a good deal of residue from past manuring locked up in the soil:—

Year.	Plot 7.		Plot 9.	
	Yield with mineral manures only.		Yield with complete artificial manures.	
	Unlimed.	Limed.	Unlimed.	Limed.
1903	Cwt. 49.5	Cwt. 51.9	Cwt. 50.1	Cwt. 69.5
1904	61.9	61.8	63.7	69.8
1905	44.3	47.2	36.9	52.2
1906	34.4	41.4	39.0	53.0

4. The leguminous crops usually cultivated on the farm flourish better when a good supply of lime is present in the soil. Clover, in particular, is very intolerant of acid soil conditions, and is much more subject to Clover sickness when lime is deficient.

5. It seems to be established that the soil organism (*Asotobacter*) which fixes nitrogen without the aid of leguminous plants, and is probably a great factor in the gain of fertility when land is laid down to grass, cannot develop properly unless a good supply of carbonate of lime is present.

6. Lime in one form or another is the best remedy for finger-and-toe disease* in Turnips and Swedes. These root crops are always liable to the disease when the soil is deficient in lime.

The fertility of many farms to-day is undoubtedly due to the liming and chalking that was done by the farmers of the eighteenth and earlier centuries; they, indeed, made the soil, for it is through their labours that it remains in profitable cultivation at the present time. Owing to the very large amount of chalk and lime which were then applied, it has been possible for later generations to live upon the capital thus accumulated and dispense with any expenditure of their own in this direction. But this spending process cannot continue indefinitely, for natural causes alone—the percolating rainwater—are steadily removing the lime in the surface soil; for example, the Rothamsted soil, which at the beginning of the nineteenth century must have contained something like a hundred tons of chalk per acre, has now less than fifty, and many other soils which started with a smaller initial stock are beginning to run dangerously short. In many parts of the country there is evidence that the land, especially on the heavier soils, is in need of liming, and though it might not be wise to return to the old heavy dressings of six to ten tons to the acre, a much smaller quantity, half a ton or so per acre, could be profitably applied at least once in the course of each rotation."

(To be continued.)

* Leaflet No. 170, issued by the Board of Agriculture and Fisheries.

* See Leaflet No. 77 (Finger-and-Toe in Turnips).

THE ROSARY.

ROSE FORTUNE'S YELLOW.

At fig. 10 is reproduced an illustration of a bouquet of Roses, comprised of flowers of the charming variety Fortune's Yellow, the blooms

Wantage. Mr. W. Fyfe, who has the charge of the gardens at Lockinge, succeeds in flowering the plant every season in one of the plant houses, and he has frequently exhibited beautiful flowers at the meetings of the Royal Horticultural Society. To Mr. Fyfe we are indebted for our illustration, and readers may learn the

scribed in a note on p. 5. There is no "brick colour" in the blossoms, but these are of a beautiful deep rosy purple. It is more than semi-double, but has no perfume, which its description in Monsieur Cochet's catalogue led me to expect it would have. I have also coming into flower, but not yet open, another hybrid from the same raiser named Rosier à parfum, which is said to be the sweetest Rose known, and yielding far the largest proportion of the attar or essential oil of Roses of any variety. I may also mention another very beautiful hybrid, though not quite so new as the above-named varieties. It is Souvenir de Christopher Cochet, and is an immense improvement on the still older variety Double Blanc de Coubert, being fully double and of absolutely pure white. This should be in every collection of such Roses. *W. E. Gumbleton, Belgrove, Queenstown, Co. Cork.*

THE ROSE PERGOLA AT KEW.

THE Rose pergola illustrated in last week's issue was constructed in its present form about six years ago. Situated between the herbaceous ground and the rockery, the pergola is rather more than 200 yards long, 13 feet wide, and 9 feet 6 inches high. It is constructed of iron; the uprights are placed 17 feet apart opposite each other along both sides of the path. Over the path they are connected by iron rods and along the sides with chains. Some 60 varieties in all are planted. In one or two instances the same sort is growing on different parts of the pergola, but, generally speaking, there are two plants of each, one on either side of the path. Two varieties were planted against each upright when the pergola was first furnished, the idea being to grow a variety of moderate growth up the pillar, and a vigorous one over the path and along the chains. This idea has not worked very well, and in many instances, unless the Roses are in flower, it is difficult to see where one sort begins and the other terminates. *D. D.*

HARDY FLOWERING PLANTS.

THE GILLENIAS.

AMONGST the more ornamental of hardy flowering plants are the Gillenias—pretty Spiræa-like plants of elegant habit and appearance, but although they are moderately well known in gardens they are not so largely cultivated as their merits deserve.

Only two species are in cultivation, and both are natives of north-east America, where they are found in woodlands. In this country they are often planted in dry and sunny borders, whereas they require partial shade and prefer a somewhat moist border. *Gil'enia stipulacea* and *G. trifoliata* bear a considerable resemblance to each other, and are sometimes confused in gardens.

Of the two, *G. trifoliata* is the better garden plant, not only because its individual flowers are larger than those of its congener, but also on account of the greater number of blooms it produces, and the possession of a persistent red calyx which are very effective. The flowers are much larger than those of the *Spiræas*.

Both species grow to about 2 or 2½ feet in height, and they are exceedingly ornamental when in their graceful and slender leafy stems and pretty flowers. These latter are white and sometimes red in *G. trifoliata*, those of *G. stipulacea* being white tipped with pink. The latter plant is also more pubescent than *G. trifoliata*, while the leaves are also narrower.

They are increased by division or by seeds, which should either be sown directly they are ripe or in the following spring under glass.

G. stipulacea is known as the American *Ipecacuanha*; *G. trifoliata* as Indian Physic or Bowman's Root. Both species flower in this country from June to August. *S. Arnott.*

FIG. 10.—ROSE FORTUNE'S YELLOW.

of which are of a shade of buff marked irregularly with crimson. This Rose has been the subject of numerous articles in these pages, but it has proved to be a shy-blooming variety under cultivation. There are, however, instances where success has been obtained persistently, and a very good one is found in the gardens attached to Lockinge, Berkshire, the residence of Lady

details of the cultivation afforded this Rose at Lockinge by reference to an article by Mr. Fyfe in our issue for March 21, 1903, p. 178.

ROSA RUGOSA HYBRIDS.

I HAVE now in flower the beautiful new hybrid of *Rosa rugosa*, raised by Monsieur Gravereau, and named *Roseraie de l'Hay*, which was de-

PLANT NOTES.

IPOMOEAS.

THESE plants are not so common in English gardens as they were some years ago, the reason for which is, somewhat difficult to discover, unless it be lack of sunshine. There are many ways of displaying and employing the plants, as on rough fences, hiding objectionable buildings, or objects, and rambling over strong-growing shrubs, or pea-sticks. The best species is *I. rubro-cerulea*, from Mexico. If it is desired to grow this plant out-of-doors, in countries in which there are many dull and sunless days in the summer months, the seeds should be sown in gentle warmth in the early part of March, and be pricked off when a few true leaves have appeared, and potted two or three weeks later. In the month of May the plants should be transferred to large pots, and when there is no longer any frost to fear these may be sunk in the ground, and stout stakes 10 feet high given to each, to which the bine should be fastened. Means should be taken by placing cinders or pieces of slate under the pots to prevent the roots extending themselves in the outside soil. *F. M.*

ISMENE CALATHINA.

In the *Oesterreichische Garten-Zeitung* for June, 1907, appears an article by Mr. R. J. Mann concerning the cultivation of this species of *Amaryllideæ* and its employment in the garden. The plant is a native of Brazil, and does not withstand the trials of our winters out-of-doors; but it can be planted in the open in the spring to make its growth and to bloom in June and July. The bulbs must be taken up before frosts occur, and be wintered in a dry, frost-proof place. The greater worth of this bulbous plant consists in its ability to stand forcing like a Hyacinth or other so-called Dutch bulb. Certainly it is not adapted for early forcing, as its vegetation is not finished so early as that of a Hyacinth, and naturally it must have a season of rest before it is awakened to a new life; but, just as is the case with the Hyacinth, this rest period can be shortened very considerably by placing the bulbs in a warm and moist place. The blossoms having great beauty and a pleasant fragrance, the plant forms a valuable change to the forced Hyacinths, Tulips, and Narcissus usually found in gardens. As a cut bloom with long stalks, and of large size, *Ismene* will find as much favour with the public as the *Eucharis*, to which its blooms have some similarity. Treated like *Gloxinias*, the bulbs may be started in a warm-house, placing them in damp sand. In the course of two or three weeks the roots will show themselves, and the bulbs may then be potted singly or in two's and three's in pots of similar sizes, in rich soil, and provided with good drainage. The pots should be placed on a warm bed, and not kept dark as is the way with Hyacinths, &c. In about three weeks the leaves will begin to show, and the blooms will appear as soon as the leaves are fully developed. The flower buds appear at the top of the 16-inch tall shafts to the number of 3-5, which open in succession, but not so that all are open at one and the same time, as even when placed in a cool house the first bloom to open will be past its best before the next expands. As a period of 10 to 14 days elapses between the opening of the first bloom and the passing of the last, florists must take notice of this fact and act accordingly. A large flowered variety, *I. c. grandiflora*, has found its way into commerce. The bulbs will, with suitable cultivation, continue to flower for many years in succession if after flowering, and the leaves have turned to a yellow tint, the bulbs are kept in a perfectly dry condition. *F. M.*

TREES AND SHRUBS.

SOPHORA VICIIFOLIA.

THIS species is of comparatively recent introduction to British gardens. A native of Central and Western China, it was introduced to cultivation by Dr. Henry, who sent seeds, collected in the Province of Hupeh, to Kew in 1898, from which plants were raised which flowered in 1902. On the Chino-Tibetan frontier at elevations of from 9,000 to 13,500 feet it is said to form heaths 2 to 4 feet high of considerable extent on poor soils, and it would thus seem capable of withstanding both cold and drought as well as a poor-rooting medium—qualities which may make it valuable for planting in urban districts.

Near the north end of the succulent house at Kew is a small circular bed filled with *Sophora viciifolia*, which quite recently was a mass of bloom. The plants are low spinescent shrubs from 2 to 4 feet in height, clothed with vetch-like, pinnate leaves 1 to 2 inches long, with six to ten pairs of elliptic leaflets and a terminal one. The short, erect racemes are freely produced at the ends of axillary growths, and each raceme bears about one dozen pea-shaped flowers. The contrast presented by the violet-blue colour of the calyx and pedicels, and the milk-white petals is most effective. The species was figured in the *Botanical Magazine*, tab. 7,883. *H. Spooner.*

FREMONTIA CALIFORNICA.

THE author of that interesting work, *Trees and Shrubs for English Gardens*, mentions a fine plant of this *Fremontia* measuring 8 feet in height; at the present time there is in these gardens a bush with an average height of 13 feet, and the spread of the branches measures nearly 15 feet. The whole bush is covered with its yellow flowers and opening flower-buds.

It is rather unfortunate that this fine flowering shrub should be subject to a sudden collapse, but considering the other valuable qualities of the plant, this fact should not deter those who have suitable positions from adding *Fremontia californica* to their collections.

The plant flowers fairly well even when small.

ABUTILON VITIFOLIUM.

THIS is a very desirable and quick-growing shrub, suitable for a warm and sheltered border. Established seedlings in pots planted in these gardens in the open in the spring of 1904 have now attained to a height of 9 to 10 feet. Last summer only a few flowers were produced on these plants, but at the present time they are flowering freely. One specimen has been a perfect pyramid of flowers. It is satisfactory to know that plants of the size mentioned can be moved with safety. *H. S. Crag, Bournemouth.*

BUDDLEIA GLOBOSA.

THIS Chilean shrub has long, greyish, Willow-like leaves, and in its flowering season produces a profusion of globular heads of brilliant orange-coloured flowers. It is one of the most beautiful hardy exotic plants, and is worthy a place in every collection of shrubs. In the west and southern counties of this country the species succeeds admirably, and often forms a dense bush from 12 feet to 15 feet in height and measuring from 8 feet to 10 feet through. Frost rarely injures the plant to any appreciable extent. In villa gardens, providing the soil is of a light, rich, loamy nature, it forms an ideal subject for planting. Should pruning be necessary from considerations of space, the knife may be used without fear of permanently injuring the shrub. *F. G. Titcher.*

BUDDLEIA COLVILEI.

THIS species has been in full bloom on an open border here for the last three weeks. It is quite hardy, and is readily increased from cuttings of half-ripened wood inserted in August,

but to obtain the best results the bushes should be planted in a rich, loamy soil. The branches, which attain to a length of from 5 to 6 feet, are terminated by long panicles of beautiful rosy-red-coloured flowers, while at every axillary shoot an inflorescence, proportionate in size, is produced, making this shrub a very attractive feature in the garden. *J. D. Winter, Culzean Castle Gardens, Ayrshire, Scotland.*

THE AMERICAN GOOSEBERRY-MILDEW ATTACKING THE RED CURRANT.

WHEN investigating an outbreak of the American Gooseberry-mildew (*Sphaerotheca mors-uvæ*) in Norfolk a few days ago, I found that this mildew had passed from the affected Gooseberry bushes on to some Red Currant bushes which were growing intermixed with them.

The facts are as follow:—The Gooseberries, which are three-year-old bushes, were obtained last autumn from a certain nursery. Traces of the winter-stage of the American Gooseberry-mildew were still to be found on the young wood of these bushes, so it is evident that they were diseased when sent out from this nursery. A few weeks ago the owner noticed the white, powdery, summer-stage of the mildew on the berries and leaves of these bushes. At the time I visited the plantation, the mildew was vigorously attacking the young wood of the shoots, covering it, as well as most of the terminal leaves, with a white "mould." On the surface of some of the shoots the brown, scurfy spawn, bearing the fruit-conceptacles with the winter-spores, had already formed.

Intermixed with these Gooseberry bushes, and in the same row with them, were many one-year-old "Grape" Red Currant bushes, and the leaves of a number of these were being attacked by the American Gooseberry-mildew; white patches of the mildew being visible on the under-surface of the leaves. These facts show that the American Gooseberry-mildew is capable of at once attacking and living on the Red Currant, and does not require time to accustom itself gradually to this plant.

Cases of the American Gooseberry-mildew attacking the Red Currant have occurred in America, and, since this mildew has been introduced into Europe, in Ireland, and on the Continent.

In October last I recorded* a case of the European Gooseberry-mildew attacking Red Currant bushes. Although the two mildews are very similar in general appearance in their summer-stage, they can be separated easily under the microscope by certain distinctive characters shown by the shape, &c., of the spores (conidia). I should be glad if anyone meeting with a mildew on the Red Currant would kindly forward me a specimen to the address given below.

I may mention here that I have lately seen a case where some Gooseberry bushes were attacked by the European Gooseberry-mildew, in which the mildew was not confined (as is usually the case) to the leaves, but occurred also on the green berries. On some of the affected berries the characteristic fruit-conceptacles (perithecia) of this mildew occurred. Mr. F. Smith, of Loddington, Kent, has told me that some years ago the berries of some of his bushes were attacked in the same way, and Prof. Eriksson has recently recorded† and illustrated another case occurring in Sweden.

On the subject of the spread of the extremely destructive American Gooseberry-mildew, and the legislative steps now about to be taken against this new disease, I would refer readers to my articles published in this and other papers. *E. S. Salmon, F.L.S., Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

FIG. II.—STEWARTIA MALACHODENDRON. (See "Botanical Magazine" on p. 32.)

THE ALPINE GARDEN.

SAXIFRAGA AIZOON LUTEA.

DURING the past few years the aizoon section of the Saxifrage family has been enriched by the introduction of more than one good and distinct variety. Amongst other kinds are two bearing names suggestive of yellow or yellowish coloured blossoms, and of these the one bearing the varietal name *lutea* is much the better garden plant, but it cannot be regarded as a decidedly clear yellow-flowered variety. The flowers during their expansion and immediately afterwards are of pale primrose-yellow, but later they assume a creamy shade. I have a few seedlings raised with the object of obtaining a better yellow-flowered variety, and in this I hope to be successful. As a free-growing subject and one full of vigour, with profusion of flowering, the plant under notice is welcome. Not only is it free and profuse in its flowering, but the flowers are also long lived. Individually, the blossoms are large and of good form, and I regard its blossoms as the most shapely of all the flowers of this section of the Saxifrage. The inflorescence is about 9 inches high. The leaves are nearly oblong lanceolate in shape, with the rosettes lacking the cupped character so common in this section. The plant is easy of cultivation, and must not be confounded with *S. a. flavescens*, another variety having yellowish-coloured flowers, and apparently in growth and stature a counterpart of *S. a. minor*. *E. J.*

IRIS SIBIRICA "SNOW QUEEN."

SEVERAL new varieties of *Iris sibirica* have lately been introduced from Japan, where apparently they have been grown for generations. These new introductions are great improvements upon the original type known in gardens in this country, and are to be recommended for planting both in the water garden and in the flower border. The choicest of the new arrivals is named "Snow Queen." This plant attains to 3 feet in height, and has broad, robust foliage that is quite unlike that of most Siberian Irises, and more resembles that of *I. lœvigata*. The flower is exceptionally well balanced, and has broad, horizontally-erected falls, with drooping blades, inconspicuous style branches, and prettily frilled standard petals that are half the width of the blade. The flower is pure white, save for a slight suffusion of yellow in the claw. The substance of the flowers and their increased size and vigour suggest hybridity, one of the parents probably being a white variety of *I. Kämpferi*.

I. SIBIRICA ORIENTALIS

is an albino, and whereas most pure white forms are weaklings compared with the type from which they spring, in this variety increased vigour is seen. I have a few clumps growing in a cool and sequestered corner, where the sun cannot burn the petals, and the flowers have been a study in perfect outline and purity of colouring for many days. This *Iris* should find favour as a waterside plant. It has a vigorous constitution, and is best planted in groups or colonies.

IRIS DELAVAYI.

THIS beautiful species was introduced from Yunnan about 10 years ago, but it has not received that measure of popularity that its worth entitles it to. It is a tall, beardless *Iris* of free growth, larger than the *sibirica* type in every respect. It has close affinities with *I. orientalis* and *I. spuria*. Its best and most effective use in gardens is in waterside planting, where it should be grouped in colonies at the water's edge in the manner that *Iris pseudo-acorus* grows naturally. The leaf-growth, in addition to being very free, is elegant in the extreme, the leaves forming loose sheaves more than 3 feet in height: the leaf tips arch gracefully, and on the whole the foliage bears a resemblance to

that of a *Eulalia*. The flower-spikes reach 5 feet in height, and produce a succession of flowers, coloured as in *Iris reticulata*, the standards being nothing more than enlarged replicas of those of *I. reticulata*, whilst the fall petals have drooping, narrowed blades, that are slightly blotched with white at the bend of the claw. This *Iris* possesses grace and refinement; its flowers are unique amongst the grassy Irises in colour and in form. Cultivation is as easy in every respect in the case of the common Yellow *Iris* of English swamps. The flowering season commences at the end of June, and continues throughout July. Planting should be done in spring only. *G. B. Mallett.*

The Week's Work.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Dahlias.—These plants now require constant attention. Search must be made for such enemies as snails, earwigs, and caterpillars, which do much injury to the young, succulent growths, and the flower-buds. If extra large flowers are desired, the growths should be thinned, disbudding practised, and some of the younger shoots around the flower-buds of varieties with short stalks removed. Secure the plants from injury by wind, but do not bunch the shoots tightly. The *Dahlia* is a gross feeder, therefore some manurial assistance should be given; the ground being wet from the recent rains precludes the use of liquid manure, therefore lightly sprinkle the surface soil at intervals with some artificial manure.

Layering Carnations.—The easiest and most certain method of increasing the stock of these plants is by layering the growths. A batch of seedlings may produce some plants that possess a certain degree of merit, but the majority will prove inferior varieties, and it is better to increase plants of known worth by layering. This operation should be performed as soon as possible, so that the growths may form established plants before the winter sets in. Lightly disturb the surface soil around the plants with a hand fork before placing in position the sifted soil in which the layers will be pegged. These mounds of soil must be made fairly flat, or they will not readily admit water. The operator must keep the edge of his knife sharp, and the layers must be pegged firmly into the soil. Apply water carefully through a fine rose as often as may be necessary, and lightly damp the layers overhead towards the close of bright afternoons. The layers will form roots in about a month, when they should be carefully severed from the parent plants, preparatory to being transferred to their winter quarters.

Lavender.—As soon as the flowers on the lower half of the spikes are expanded, the inflorescences should be harvested. The flowers must be perfectly dry when they are gathered, or they will quickly become mildewed; and for the same reason they should be made into small bunches. The *Lavender* forms a good low hedge, and when so utilised, the best time to perform any necessary pruning is immediately after the flowering is over. This practice will allow sufficient time for the new growths to become hardened before winter sets in.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq., Norwood, Alloa, Clackmannanshire.

Young Vines that were planted in a new border in March last, and whose leading shoots were pinched when they had attained a length of 4 feet, should be again stopped as soon as the leading growths reach the top of the roof. Tie and pinch the lateral growths, and do not favour the development of gross wood by maintaining a warm and moist atmosphere in theinery. Admit air freely, and allow the top ventilators to remain open a trifle at night-time. Maintain a dry atmosphere, and permit a free circulation of air among the foliage. The atmospheric temperature at night should be 65° Fahr., and by day 80°; very little fire-heat should be employed, unless the weather is excessively cold. Do not allow the border to become dry at any time,

and when in doubt as to its condition of moisture, use the border-tester. Should red spider make its appearance, syringe the vines with clear water once daily.

Tomatos.—Early-fruiting plants in pots, from which the crop is nearly harvested, should now be removed, and their places given to a second batch. Pots 9 inches in diameter are suitable for these successional plants. Before re-stocking the house, it may be necessary to thoroughly cleanse it, especially if fungus disease or insect pests were present on the older plants. If only a single row of plants can be accommodated in the house, place the pots close together. Admit an abundance of outside air, both by day and night during the heat of summer. Plants in fruit and flower will require liberal supplies of water, and an application of liquid manure twice each week. All lateral growths must be removed, and the leading shoot should be stopped when it has reached to the top of the stake or trellis. If white fly is present, fumigate the house lightly with the XL-All insecticide.

Cucumbers.—Plants that have been fruiting for some time, and which show signs of exhaustion, should be destroyed and a fresh batch planted. Remove all the old soil from the top parts of the border, and replace it with fresh loam. When the young *Cucumber* plants have been planted, give a copious supply of tepid water to the roots.

Cucumbers in frames.—During dull weather, the female flowers will require pollinating with pollen obtained from the male flowers. When the young fruits are swelling, place a slate or a piece of glass under each fruit.

Melons in hot-beds.—The fruits should be placed on an inverted 6-inch flower pot, and be exposed to a maximum of sunlight. Remove any superfluous young growths. Apply a new lining of fermenting material to the frame when the heat of the bed is declining.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bickton, East Devon.

The Loganberry.—The strong basal growths of the current season should be reduced to five or six of the more robust, and these should be secured to the wires or trellis work, so that they do not become broken or twisted at their bases. The *Loganberry* resembles the *Raspberry* in that it requires plenty of feeding during summer, especially when planted in light soil. The above remarks apply also to *Blackberries*.

Fruit trees on walls.—Pinch at the first leaf all sub-lateral growths on the Peach, Nectarine, and Apricot. See that no fruits are pressing too tightly on the wires or against nails, and if aphid or red spider are present on the foliage use means to combat them. The frequent hosing or syringing of all fruit trees trained against south, west, or east walls after a hot day is most beneficial, even if the trees are free from insect pests; these syringings promote a free growth of both wood and foliage. Keep narrow and shallow borders well supplied with moisture, using liquid manure whenever it is deemed necessary.

Hoeing.—The hoe should always be frequently used at this season in the fruit garden, for if the atmospheric conditions are wet, the weeds will need exterminating, and if dry the stirring of the ground will prevent excessive evaporation of moisture, besides promoting aeration of the soil.

Raspberries.—The ripening fruits must be protected from the birds. Nets, however light in weight, injure, more or less, the new canes, and their constant removal for gathering the fruits is often the cause of the points of the shoots becoming broken, and also the fruit-bearing laterals. The best plan is to form a kind of net cage over the rows by inserting a few posts in the ground, and tall enough to clear the canes, with pieces of wood on the top projecting some 18 inches on either side in the form of a T. Over this the nets may be placed without damaging the canes. Every advantage should be taken of sunshine for gathering the fruits for preserving, for they must be dry for this purpose. Thin out the young growths on autumn fruiting canes, and apply a mulching of manure, if this has not already been done.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Catascums, *Cynoches*, and *Mormodcs*.—These curious Orchids deserve to be more generally cultivated. The quaint distinctiveness of their flowers always attracts the attention of visitors, while some of them are of handsome appearance. Unfortunately these species are generally looked upon as being difficult to cultivate in such a manner as to keep them in good health, but if their requirements are carefully studied, successful cultivation is easily possible. At the present time these plants are growing rapidly, and they should be suspended on the lightest, or south, side of the East Indian house in such a manner that the foliage will be within a few inches of the glass. If the plants are rooting freely they will need an abundance of water, but if roots are not plentiful, water must be afforded less freely, as the tender growths would be liable to turn black and decay if the soil were made too wet. The flowers appear as the pseudo-bulbs become mature, and after the flowers are past the plants should be given more exposure to the sunshine, placing them, if practicable, in a position where fresh air may reach them at all times. While this ripening process is being carried out, the plants must be plentifully supplied with water at the roots until the new pseudo-bulbs are ripe and the leaves have fallen, when watering must be discontinued.

Chysis.—The various species of *Chysis* and their hybrids are now in full growth. The plants should be suspended in a warm, shady part of the Cattleya house, and they will require copious applications of water at the roots until their new growths have matured. Whether thrips attack the tender growths or not, our practice is to occasionally place the plants in a house that is being vaporised, and by such treatment the leaves are kept fresh and clean and free from unsightly markings which are often caused by insect pests.

Zygopetalums.—Such species as *Z. Perrenoudii*, *Z. Murrayanum*, *Z. Wiganianum*, *Z. Burkei*, *Z. brachypetalum*, *Z. triste*, *Z. Protheroeanum*, *Z. Ballii*, *Z. Mackayii*, *Z. crinitum*, and *Z. maxillare* all require similar treatment to that I have just recommended for *Chysis*. If small, yellow thrips once find their way low down in the young growths, it is difficult and almost impossible to eradicate them before much irreparable damage is done, for such growths as become infested with these troublesome insects rarely make further progress. These *Zygopetalums* thrive well in a cool, shady corner of the intermediate house, and now that growth is being made the plants should be thoroughly watered whenever the compost is dry. Plants of *Z. maxillare* and its variety *Z. m. Gautieri* that are growing on the stems of tree Ferns, upon pieces of which they are nearly always imported, should be suspended well up to the roof glass in the same house and as near to an open ventilator as is possible. Now that they are growing freely it is advisable to take them down every morning and thoroughly soak them in water. Should black or damp spots appear on the leaves of any of these *Zygopetalums* it will be necessary to ventilate their surroundings rather more freely and reduce the amount of moisture in the atmosphere.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Thyracanthus rutilans.—Young plants that were raised from cuttings last spring should now be ready for re-potting into their flowering pots. Use a compost consisting of two parts turfy loam, one part leaf-soil, and one part well-rotted manure, with the addition of some sand. After the roots have become active in the new soil, place the plants in a frame, keeping them well up to the glass to prevent the growth from becoming spindly. Syringe the plants, and close the frame, as early in the afternoon as is considered safe, in order to take advantage of the sun's heat. A little shading will be necessary during the hotter parts of the day in summer-time, but early in September shading may be discontinued, and the amount of atmospheric moisture can then be reduced, but do not withhold fire-heat or a check to the plants will result. Allow them to flower in a minimum atmospheric temperature of 60° at night-time, with rather more than this amount of heat during the day.

Keep a watch for red spider and thrips, and take preventive measures to combat these pests early.

Jacobinia (Justicia) carnea.—This plant will thrive under similar treatment to that recommended for *Thyracanthus*, but it is quicker in growth, and will flower when almost any size, and in small pots. *Jacobinias* are easily propagated; the young shoots root readily in the propagating frame if inserted in a light, sandy soil. If larger plants are required for flowering in the autumn, the points of the shoots should be pinched several times during the growing season, and the plants placed close to the glass; they should be re-potted as often as they require a shift. A plant sometimes described as *J. flavacoma* is really *Schaueria calyotricha*. It has yellow flowers, and affords a pleasing change to the pink flowers of *J. carnea*.

Climbers in stoves and greenhouses.—At this season of the year frequent attention is necessary, in order to regulate all climbers to the space allotted them, for if they become a tangled mass of growths, they will prove a nursery for insect pests. *Stephanotis*, *Dipladenias*, and *Cissus discolor* are all susceptible to attack by mealy bug; they should be closely watched for this pest, and, as a measure of precaution, sprayed occasionally with an insecticide. The growths should be thinned and regulated, the main shoots tied to the wires, and the lateral growths allowed to hang down naturally. *Allamandas*, being of a stiffer habit, are not adapted for this style of training, but the weaker growths should be cut out. If planted in tubs or confined borders, *Allamandas* must, when in full growth, be given copious supplies of water and manurial stimulants at intervals, for they are gross feeders. *Cobæas*, *Solanums*, *Bougainvilleas* and other climbers in cool houses will also need attention, weekly or fortnightly.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq., Cobham Park, Surrey.

Peas.—In order to prolong the season of this vegetable as much as possible, let sowings of early varieties be made at once. It should be remembered, however, that the plants from such sowings will have to make their growth during the hottest period of summer, and that the autumn may be cold and wet. The matter, therefore, is little more than a speculation, and the crop cannot in the smallest measure be depended upon. When the conditions prove to be favourable, this late crop is so appreciated that it compensates for any previous failures that may have been experienced. The seeds should be sown in such a position that the plants may be given temporary shelter during the hottest weather, but at other times enjoy full exposure to the sun, light, and air, especially on the approach of autumn.

New Potatoes.—If "new" tubers are desired at Christmas time, the Jersey Potatoes now being imported will provide excellent "seed" tubers for planting. Great care should be exercised in order to choose those having the skins properly "set," and which are therefore ripest. The ripening process should be assisted by fully exposing the tubers to the sunlight and air until the end of the present month, after which time they should be started into growth very steadily in boxes, previous to planting them in cold frames, which should be kept quite cool until autumn, when a little heat may be afforded. From this system we obtained very good results here last winter.

Mint.—Where a supply of Mint is required for forcing early in the year, cuttings should now be inserted in boxes, which should be filled with a compost of loam and leaf soil, but principally the latter material. Although it is easy to obtain a supply by simply lifting the roots in autumn or winter and placing them in heat, much stronger growths can be had from cuttings inserted as advised.

Cabbages.—Seeds should be sown at any time from the beginning to the end of the present month, according to the locality, which must of necessity be the guide both as to the date and the best varieties for cultivation. It often happens that a particular variety that is generally satisfactory in one district is not capable of yielding good results in another district,

although the standard of cultivation shall be equal in both cases.

Colewort.—This useful little Cabbage "turns" in at the end of the season, when Peas, Beans, and Cauliflowers are becoming very scarce. Seeds should be sown in two or three batches, the first at about the end of June, the second in the middle of the present month, and the third about the end of the same month. Although often two sowings prove to be sufficient the third sowing in other seasons is very useful.

Red Cabbage.—Sow seeds of the Red Cabbage for raising plants to be used for pickling. Better results may be expected from a sowing made at about this date than if it were left until later.

Garlic and Shallots, having by this date completed their growth, should now be lifted and spread out under lights, or in a vacant frame, or in any position where they can be protected from rains, but where they will be fully exposed to the light and air.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Boating.—Very few parks in this country possess sufficiently large lakes to provide suitable boating facilities for the public. Those which are so favourably situated in this respect are exceedingly fortunate, as boating is always an attraction, and can be made a considerable source of revenue to the department concerned. In such cases it is usually the practice for the boats to be managed by a contractor, who pays a stated sum per annum for the privilege of hiring them out to visitors. In one or two towns the parks department works the boats with its regular staff, and thus keeps the whole thing in its own hands. This, for several reasons, is undoubtedly the better course to pursue. In the first place it is rarely satisfactory having men employed in parks who are not under the direct control of the chief official. From the public standpoint it is only right that where it is necessary to make a charge for any privilege in connection with the use of a park, any profit that may be derived from it should be applied for the benefit of the public, and not go into the pocket of a private individual.

Custom in London.—The London Parks Department has within recent years taken over the boating from its contractor, and now makes considerably more profit than under the old system, notwithstanding the fact that the hiring-out fees have been greatly reduced.

Types of boat.—Where fishing is provided, it is well to have two kinds of boats on hire. One kind should be of the punt type for the use of fishermen, and the other the light skiff, suitable for rowing purposes. Whether the boats belong to the park authorities or to a private contractor, it is advisable to have them all tested, and the maximum number each is allowed to carry distinctly marked on every boat. If this is not done, and the boats are allowed to be overcrowded, accidents of a serious character are almost sure to take place. As a further preventive of accidents on the water, it is customary to have a recognised rule of the "road." By keeping to the left or right, as the rule may be, the danger of collisions and their consequent damage to the boats is reduced to a minimum.

Management expenses.—If the boating is to be made to pay a profit, it is essential to keep the management and working expenses to the lowest possible sum. One means to this end is by only allowing admittance to the boating stage through a register turnstile. Besides furnishing a proper check upon the receipts, this enables one man to keep a whole crowd under control, and by permitting only the number for whom boats are available to get on to the stage at one time, it is quite possible for three or four men to easily attend to 40 or 50 boats.

Electric launch.—In some parks an electric launch is kept, in addition to the small pleasure boats. These are always well patronised by children during Bank and other holidays. A house for storing the boats during the winter months, and in which painting and repairing can be done during inclement weather, is necessary where boating is carried on to any great extent.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 16—

Opening of the Laboratory and Research Station at Wisley by Lord Avebury.
Nat. Sweet Pea Soc. Sh., Horticultural Hall, Westminster.
Saltaire Rose Sh.

WEDNESDAY, JULY 17—

Woodbridge Fl. Sh.
Women's Agric. and Hort. Union Exh. in Bot. Gardens, Regent's Park.

SATURDAY, JULY 20—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—63° 1'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, July 10 (6 P.M.): Max. 61°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 11 (10 A.M.): Bar. 30° 4'; Temp., 62°; Weather—Bright sunshine.

PROVINCES.—Wednesday, July 10 (6 P.M.): Max. 55°. Ireland, N.W.; Min. 51°, Yorkshire.

SALES FOR THE ENSUING WEEK.

TUESDAY—

The beneficial interest in the lease of the Oxford Nursery, Oxford Road, Gunnersbury, at 12; and afterwards the whole of the stock of Plants, by Protheroe & Morris.

WEDNESDAY, THURSDAY AND FRIDAY—

The second portion of the Woodlands collection of Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Holland House Show.

Visitors to the Royal Horticultural Society's summer show at Holland House, of which a detailed report appears in our present issue, could hardly have failed to be impressed with the high quality of the exhibits. The numerous groups of plants and flowers were deserving of praise, whether regarded as evidence of successful cultivation, or as selections of the choicest plants obtainable for the embellishment of the garden. In the large tent where the Orchids were exhibited on the central tables, there were comprehensive groups of miscellaneous plants that successfully vied with the Orchids for a share of appreciation. The "Sherwood" Silver Cup, being reserved on this occasion for the best exhibit of hardy plants or flowers, was awarded to one of these groups exhibited by Mr. Bradshaw, an amateur cultivator. There were many collections of hardy plants and garden flowers. All were interesting, and such exhibits as those of Mr. Amos Perry, Messrs. R. Wallace and Co., and Messrs W. Cutbush and Sons, that contained representations of water gardens, with Nymphaeas and other aquatic plants growing in them, were most charming.

Roses being now at their best, the groups of Messrs. Paul and Son, Messrs. R. and G. Cuthbert and other exhibitors were even more profuse of flower than the Rose groups exhibited at the Temple Show, whilst several new varieties of the Rose were shown by Messrs. A. Dickson and Son.

Messrs. Jas. Veitch and Sons' group of ornamental foliage plants, Messrs. J. Peed and Sons' Caladiums, Mr. L. R. Russell's stove foliage plants, and other ornamental-leaved plants from Messrs. W. Bull and Sons were remarkable for the excellent cultivation they illustrated as applied to rare and choice species. Most of these groups were arranged in the tent containing the Orchids, and so we might continue enumerating those that were shown in other tents, but for details of these we must refer readers to the report.

There were not many novelties of outstanding importance presented for the inspection of the various committees, but a species of Crinum, introduced from Burmah, and shown by Colonel Beddome, created considerable interest. The plant was growing in a pot having a diameter of only three inches, yet it had produced two inflorescences, which together bore 13 flowers and flower-buds. Most species of Crinum are large-growing plants, which usually flower only after attaining to considerable dimensions; the present species, therefore, which deservedly obtained a First-class Certificate from the Floral Committee, appeared extremely small and precocious. It has been named *C. Mearsii*, and may possibly prove to have close affinity to *C. humile*, of which a figure is given in the *Botanical Magazine*, tab. 2,636.

Another novelty likely to become valuable as a garden plant was the hybrid Crinum, raised by Mr. H. J. Elwes from the species *C. Moorei* and *C. americanum*. The flowers of the hybrid are coloured almost exactly as those of the Belladonna Lily (*Amaryllis Belladonna*). A remarkable Odontoglossum of the blotched type of flower was shown by Messrs. Sander and Sons, and a very richly coloured *Laelio-Cattleya* shown by M. Lambeau, Brussels, obtained a First-class Certificate from the Orchid Committee. Details of these and other novelties are given in the report.

The invitation kindly given the Society by Mary Countess of Ilchester, to hold a summer show in the paddock in front of her delightful Elizabethan residence affords the council an opportunity to entertain the members of the Committees at luncheon. Sir Trevor Lawrence, who presided at this function on Tuesday last, referred to the approaching ceremony in connection with the opening of the laboratory and research station in the Wisley Gardens, remarking that, following this event, the Society would be in a position to impart instruction to its students on the more advanced scientific principles that underlie horticultural practice. The President made a further remark which directly affects the convenience of those who visit such shows as are held in the Temple Gardens and at Holland House. He said that the firms who supply the tents must be asked whether they cannot use some material that is more transparent than that generally employed. Exhibitors will have every sympathy with any effort that is made to obtain marquees which are less light-excluding than those now in

use, which often are very prejudicial to the effect of the exhibits. From cursory observations it would appear that the longer the material has been in use the more obstructive it becomes, but it is impracticable to have new tents for each occasion.

In the interests of the gardening charities the private grounds of Holland House were again thrown open to visitors on the first day of the exhibition, who paid a small sum for admittance, and we are exceedingly pleased to hear that a sum of £167 was thus raised. The beautiful gardens appeared thronged during the greater part of the afternoon, and every visitor must have been charmed by the showy Rose borders, in which the excellent variety Caroline Testout was as attractive as ever; the beds of *Epilobium* and other equally familiar plants, which at Holland House are made to contribute to the general attractions; the quaint Dutch garden, the water gardens, and other features, all of which have been referred to in these columns on previous occasions.

Since the introduction to Europe of the handsome species *M. Meconopsis racemosa*, integrifolia, which first flowered in this country in 1904 (see supplementary illustration to *Gardeners' Chronicle*, October 1, 1904), the genus *Meconopsis* has received greater attention from horticulturists. In our own pages we have figured, since that date, *M. punicea* (*Gardeners' Chronicle*, October 22, 1904, p. 289), *M. grandis* (*Gardeners' Chronicle*, June 17, 1905, p. 369), and *M. bella* (*Gardeners' Chronicle*, September 15, 1906, p. 197). In the present issue we are enabled to present a drawing by Mr. Worthington G. Smith, of *M. racemosa*, prepared from material exhibited by Lady Northcliffe at the meeting of the Royal Horticultural Society held on June 11 last. Concerning this species Lt.-Col. Prain, Director of the Royal Botanic Gardens, Kew, who is the acknowledged authority on this genus, has favoured us by contributing the following information:—

Meconopsis racemosa is a blue-flowered "Poppy" with prickly leaves, now fairly well known as a rock garden plant, where it may be grown under the conditions suitable for *M. aculeata*, which in general features it greatly resembles. It was first described by Maximowicz in 1876, from specimens obtained by General Przewalski in 1872 in Kansuh. To his brief diagnosis of the species Maximowicz added a note to the effect that *M. racemosa* may be distinguished from its nearest ally *M. aculeata*, Royle, by its entire leaves, and from *M. horridula*, Hook. f. and Thoms., the only other prickly *Meconopsis* known in 1876, by its racemose flowers; from both, he says, it may be distinguished by its five to eight petals. We now know of the existence of other species of *Meconopsis* with prickly leaves; all of them are easily distinguished from *M. racemosa*; none of them are yet known in European gardens.

So far as the distinction between *M. racemosa* and *M. aculeata*, which Maximowicz considered the nearest ally of *M. racemosa*, is concerned, there is another and very striking difference: the flowers of *M. aculeata* arise in the axils of floral leaves and the stem itself below the flowers is leafy;

THE TOWN GARDENS, DURBAN, NATAL.

Temple Press Ltd., Printers, 7-15, Rosebery Avenue, London, E.C.

FIG. 12.—MECONOPSIS RACEMOSA: FLOWERS BLUE WITH PURPLE SHADE.

the flowers of *M. racemosa* have no bracts and the leaves are practically confined to a rosette at the base of the stem.

But when the case of *M. horridula* is considered we find, in the first place, that as originally described, *M. horridula*, though usually having simple, one-flowered scapes, has these "sometimes agglutinated at the base," which is another and, as it happens, more accurate way of stating what Maximowicz had before him. On the other hand, we find that the flowers of *M. horridula*, though originally described as having four petals, have in reality almost always five to eight petals. The characters on which Maximowicz has relied in separating *M. racemosa* from *M. horridula* do not therefore exist, and *M. racemosa*, where the flowers are all, or nearly all, racemously arranged on a leafless scape, is hardly more than a state of *M. horridula*, where the flowers are usually all, or nearly all, on simple one-flowered scapes. In an account of *Meconopsis* in *Annals of Botany*, Vol. xx., pp. 332-333, the question is dealt with as follows:—

"It is somewhat significant that this, which the writer takes to be only a condition, or at most a variety of *M. horridula*, should be well known, while true *M. horridula* is not known in cultivation. In the higher valleys of Sikkim, which the species, whereof both *M. horridula* and *M. racemosa* appear to be states, invades by crossing the inner passes, this is plentiful; it does not, however, appear to occur below 14,000 feet or to the south of the outer passes and of the line of snowy peaks like Kinchinjanga, Chumiamo, and Kinchinjao, that mark the main axis of the Himalaya in this region. Below 14,000 feet and to the south of these peaks the species is sparingly replaced by *M. sinuata*, apparently a distinct, though nearly related, species, which is represented at corresponding altitudes in the Western Himalaya by *M. aculeata*, and in Alpine Yunnan and Szechuen by *M. rudis*. To the north of these snowy peaks, and on the inner passes such as the Kongra-lama and the Tang-la, the form usually met with is *M. horridula*; at or above 16,000 feet this is practically the only form present. To the north of the inner passes below 16,000 feet both forms occur side by side, and there is every transition between *M. horridula* proper with all the scapes simple, discrete, and radical; *M. horridula* still, but with some or all of the scapes agglutinated at the base; and *M. racemosa*, with all the flowers disposed on a central several-flowered scape in a bractless raceme-like cyme. In specimens from the hills above Lhasa we sometimes find that the lowest and last-opening flower of this cyme is subtended by a leafy bract such as is associated with the lowest three-fourths to four-fifths of the flowers of *M. aculeata* and *M. sinuata*, and with the lowest half to two-thirds of the flowers of *M. rudis*. When we take into consideration the fact that the form distinguished by Maximowicz as *M. racemosa* occurs throughout central and eastern, as well as southern Tibet, and is the only form that overflows into the high Alpine valleys of Szechuen and Kansuh, while *M. horridula* is confined to southern Tibet and the high Alpine valleys of Sikkim and Phari, it is reasonable to surmise that *M. horridula* may be no more than a somewhat reduced condition of a Tibetan species whereof *M. racemosa* is the usual state."

OUR SUPPLEMENTARY ILLUSTRATION.—Seventy years ago, writes a correspondent, the elephant roamed at its leisure where the town of Durban now stands, but at the present time there is no settlement along the whole of the African coast, except Zanzibar, that possesses such a variety of tropical foliage and flowering plants as Durban. Beautiful vegetation is found not only in the Town Gardens (as shown in the illustration), but also in the streets, private gardens, and last, but not least, in the Durban Botanic Gardens. January is the month when most plants are in full flower. The Flamboyant (*Poincæa regia*) is one of the most gorgeous trees seen, its profusion of scarlet flowers are set in abundant light green, feathery foliage. It is very similar in appearance to the indigenous tree, *Albizia fastigiata*, with which a great many of the streets are planted. *Jacaranda mimosifolia* is a rather smaller tree than the Flamboyant, but it flowers equally profusely, the blossoms being blue instead of red. The tree is deciduous, and the flowers are produced principally when the leaves have fallen. The tree used more commonly than all others in street planting is *Hibiscus tiliaceus*, the Durban shade tree. It can be propagated very readily from quite large cuttings, and soon forms a bush-headed tree which produces numerous large yellow flowers. It is indigenous along the seashore in the tropics. A feature of Durban is the number of Screw Pines (*Pandanus utilis*) met with. They thrive almost everywhere on the coast, and are very ornamental subjects. Two fine specimens are growing at the entrance to the Botanic Gardens. Durban owes much of its beauty to the wild Date Palm (*Phoenix reclinata*), which, though of little economic value, produces a fine effect, especially when growing in dense clumps, the stem being from 5 to 15 feet high. This Palm likes to have its roots always near moisture, and its presence is one of the best indications of water in the subsoil. But in stately beauty as well as in utility its claims are small when compared with the lofty Date Palm (*Phoenix dactylifera*), many specimens of which, growing to a height of nearly 200 feet, exist around Durban. *Cocos nucifera*, the Cocoa-nut Palm, grows successfully in the Botanic Gardens, although it does best by the sandy seashores. Many other Palms are also to be found in the Botanic Gardens, but probably the finest is the Royal Palm (*Oreodoxa regia*), although *Cocos plumosa* may have rival claims to beauty. The great variety of plants used in the making of hedges impresses the visitor. Amongst the best and most ornamental are *Carissa grandiflora*, *Cestrum aurantiaca*, the dwarf *Bambusa Fortunei*, Tea (*Camellia Thea*) Privet, *Juniperus virginiana*, *Cupressus macrocarpa*, *Eugenia mimi*, &c. *Araucarias* thrive exceedingly well in Durban, and form a pleasing contrast to the Palms and other more gorgeous-leaved trees that surround them. The species that thrive best are *A. Bidwillii*, *A. brasiliensis*, *A. Cookii*, *A. Cunninghamii*, and *A. excelsa*. Any of these species are capable of producing valuable timber should they be planted on a large scale. Among ornamental landscape plants the *Acacias* occupy a prominent place. *A. mollissima* has dark green and feathery foliage, in contrast to *A. dealbata*, which is glaucous green, although of the same form. Both species produce an abundance of yellow blossoms, but the most showy of all the *Acacias* in this respect is *A. Baileyana*. *A. spectabilis* is also a free-flowering species; it has a vigorous, bush-like habit and silvery foliage.

THE BOTANICAL MAGAZINE.—The following plants are figured and described in the issue for July:—

ODONTOGLOSSUM LEEANUM, tab. 8,142. (See also *Gardeners' Chronicle*, 1882, vol. xvii., p. 525; 1883, vol. xix., p. 694; var. *Crawshayanum*,

1902, vol. xxi., p. 50).—Mr. ROLFE, in describing this Columbian plant, states that it is now recognised as being a natural hybrid between *O. gloriosum* and *O. triumphans*. It first appeared in this country in 1882 as a single plant in Messrs. JAS. VEITCH & SONS' nursery at Chelsea. A second plant appeared in 1902, also unexpectedly, in Messrs. T. ROCHFORD & Co.'s nursery at Broxbourne, and this is now in the collection of Mr. DE BARRI CRAWSHAY, Rosefield, Sevenoaks. The flowers are of a shade of bright yellow, and are much blotched with brown.

MONTANOA MOLLISSIMA, tab. 8,143.—This Mexican composite is described by Mr. Hutchinson. The species of *Montanoa*, when cultivated in English gardens, are generally employed as sub-tropical plants; they do not flower freely out-of-doors. The present species was introduced into cultivation by Ghiésbrecht, who sent seeds from Mexico to the Paris Botanic Garden in 1843. At Kew it is treated as a greenhouse shrub. It grows about 6 ft. high, and has sessile, lanceolate, or ovate lanceolate leaves, 4 to 7 inches long and 1½ to 4 inches broad. The ray flowers are white. The plant figured was raised from seeds received in 1902 from the late Sir Thomas Hanbury, La Mortola, Italy.

KENNEDYA RETRORSA, tab. 8,144.—This is a new Eastern Australian species described by Mr. W. Botting Hemsley. Plants were raised at Kew in 1905 from seeds received from the Sydney Botanic Garden, under the name of *K. procurrens*, Benth.; but *K. retrorsa* is distinct from that species, the type of which is in the Kew Herbarium. *K. retrorsa* is a twining shrub, having the young growths clothed with reddish hairs. The leaves are trifoliate, distinctly stalked, and are from 3 to 6 inches long. The flowers are coloured rosy-purple, with a white eye on the standard. They are clustered in racemes.

STEWARTIA MALACHODENDRON, tab. 8,145.—This is a North American species, which is better known under the specific name *S. virginica* (see *Gardeners' Chronicle*, 1877, vol. vii., pp. 433-435, fig. 86). Mr. Hemsley describes the species as a branching shrub, or small tree, 6 to 14 feet high, with slender, pubescent flowering branches. The leaves are deciduous, alternate, and very shortly stalked. The flowers are axillary, solitary, almost sessile, 3½ to 4 inches across. The petals are white, and the stamens purple, anthers blue. The drawing for the present figure was made from specimens communicated by Sir Joseph Hooker, in whose gardens at Sunningdale the species flowered freely last year. It is not in general cultivation in Britain. Mr. Bean recommends that the species should be planted in a sheltered position, for it is more likely to be injured by persistent exposure to north and east winds than by temporary spells of severe cold. A moisture-loving plant, it should be planted only where it is not likely to suffer from drought, and there should be, at least, one-third peat in the soil. The illustration reproduced at fig. 11, affords an excellent idea of the decorative character of the flowers.

PHYLLODOCE BREWERI, tab. 8,146.—A native of the Inner Sierras of California, this species was first observed by W. H. Brewer, who was attached to Prof. Whitney's surveying party from 1860-1864. The species varies in habit, and the better form now figured was discovered on Mt. Hoffmann, on the north side of the Yosemite Valley. It is an Ericaceous shrub, growing about 9 inches high, and, being perfectly hardy, is suitable for cultivation in the rock-garden. The flowers are pink, with a white centre. Dr. Otto Stapf describes them as being arranged in terminal short or long,

and sometimes very dense racemes. In an appended note Mr. W. Watson states that, in the matter of cultivation, there is no difference between the several species of *Phyllodoce* and *Bryanthus*.

THE NATIONAL SWEET PEA SOCIETY.—About 180 new members have joined the society this year, and there are now 22 societies in affiliation with it. We are informed that the exhibition to be held at the Royal Horticultural Hall, on Tuesday, July 16, promises to be a very successful one. The trials at the University College, Reading, are an important feature of the society's work, and these will be visited by the members on Friday, July 19. There are over 300 rows and 40 clumps of Sweet Peas in the trials. On Monday, July 22, the members of the society will pay a visit to Wisbech to inspect Messrs. R. H. BATH's Sweet Peas and other flowers. Full particulars can be obtained from Mr. C. H. CURTIS, Hon. Sec., Adelaide Road, Brentford.

—A correspondent writes to us stating that, "when the members of the committee of the National Sweet Pea Society journey to Reading on Friday next, the 19th inst., to examine the trials of Sweet Peas grown expressly for the society by Mr. CHARLES FOSTER, the garden superintendent of the University College, they will find that the trials are of exceptional excellence and interest. It is but needful to look over the gardens of this institution to be satisfied that a trial of Sweet Peas would be carried out with skill and the utmost care. Beautiful as were the hundreds of stocks a few days since, by Friday next the plants will be at their best, and lovers of Sweet Peas will find for themselves a great treat. The soil is so good, the culture so excellent, that all the plants are very robust."

SWEET PEA "PRINCESS VICTORIA."—We are informed that at the National Rose Show Messrs. DOBBIE & Co., Rothesay, had a beautiful light form of the Spencer type which was so much admired by H.M. the QUEEN and H.R.H. PRINCESS VICTORIA that the latter specially desired it to be named after her.

SOUTH-EASTERN AGRICULTURAL COLLEGE.—The Right Hon. AILWYN FELLOWES will present the diplomas and prizes on July 24 at the South-Eastern Agricultural College, Wye, Kent. The College was awarded the Silver Medal (highest award) at the Royal Agricultural Society's show at Lincoln, in a competition of exhibits of importance to British Forestry, for a collection of insects, &c., injurious to forest trees, which was made and set up by the Vice-Principal and Entomologist, Mr. F. V. THEOBALD.

THE LINCOLN SHOW.—Messrs. JNO. WATERER AND SONS, LTD., write to say that they were awarded a Gold Medal at the Lincoln Show for a group of shrubs.

AGRICULTURAL EDUCATION.—The Departmental Committee held meetings on the 2nd, 3rd, and 4th inst. The following witnesses attended and were examined:—Mr. CHRISTOPHER MIDDLETON, Darlington; Mr. ALBERT WHEATLEY, F.R.C.V.S., Reading; Mr. TRUSTRAM EVE, nominated by the Farmers' Club; Major CRAIGIE, C.B.; Mr. FITZHERBERT BROCKHOLES, nominated by the Lancashire Farmers' Association; Mr. A. E. HUMPHRIES, President of the National Association of British and Irish Millers; Rev. W. WILKS, M.A., Secretary to the Royal Horticultural Society; Dr. J. A. VOELCKER, Consulting Chemist to the Royal Agricultural Society of England; Mr. G. HOBGEN, M.A., Inspector-General of Schools, New Zealand; and representatives of the Dorset, Hereford, and Lancashire County Councils.

THE HORTICULTURAL CLUB.—The annual outing of the members and friends will take place on Thursday, July 25. The party will travel by rail from Paddington to Marlow, where a steam launch will be in waiting to convey the visitors to Henley. At Henley a visit will be made to Friar Park, the residence of FRANK CRISP, Esq., whose interesting gardens were described and illustrated in these pages on October 28, 1899. The visitors will be Mr. CRISP's guests at luncheon and afternoon tea. If the weather proves favourable the visit promises to be a most enjoyable one.

VIOLAS AT THE ROYAL BOTANICAL GARDENS.

—Visitors to the National Rose and the other exhibitions which have recently been held in the Royal Botanic Gardens have probably noticed the effective arrangement and the remarkable health of the Violas in the large bed in front of the conservatory. Roughly, the bed measures 150 feet long by 8 feet wide. The groundwork is composed entirely of Viola "White Beauty," except for a broad belting along the outside edge of the variety lilacina. It is remarkable that the latter, one of the oldest of Violas, should still be so much used in the London parks. Better flowers there undoubtedly are, but "lilacina" seems to have a constitution that braves all adverse conditions. Into the white groundwork of the large bed Mr. HAWES has made diamond-shaped patches, filled alternately with the varieties Molly Pope (bright yellow) and J. B. Riding (deep mauve). Small clumps of Veronica Andersonii variegata alternate with the diamonds, and behind them, at the extreme back, are clumps of Coreopsis grandiflora. It is always interesting to know the methods adopted by growers who succeed well with Violas in or near to London. Mr. J. F. McLEOD, who cultivates them extensively and so well at Dover House, Roehampton, does all his propagating under handlights out-of-doors on a partly-shaded western border. Mr. HAWES, at the Royal Botanic plants the cuttings, very often pulled from the old plants with rootlets already formed, into cold frames in September, and lifts the plants therefrom in the first week in April, with as large balls of soil attached as possible, and plants them out. This rather late planting can only be successful when special care, such as Mr. HAWES exercises, is taken to properly carry out the operation. As a rule the earlier Violas are planted the better.

THE ORIGIN OF THE POTATO.—The origin of the innumerable varieties of Potatoes in commerce, all known botanically as Solanum tuberosum, is so far from being clear that a few gentlemen were invited by Mr. ARTHUR SUTTON on Monday, the 8th inst., to inspect at the Reading Nurseries a large collection of plants embracing all the known species of Potato, with a view to their examination and, if possible, the determination of which specie or species could have given rise to the cultivated varieties. A large number of plants was displayed in one of the houses, and the peculiarities of each were described by Mr. SUTTON, and discussed by those present from the various points of view deduced from their varied experiences.

WOODBIDGE HORTICULTURAL SHOW.—In our last issue the date of this Suffolk show was, in error, stated to be July 13. The correct date is July 17.

COCOA-NUT FIBRE MATS.—In the *Review Horticole* lightly-woven cocoanut fibre mats are recommended as protection against frost and as shading materials, instead of the rapidly decaying coverings made from straw. They are said to last for about 10 years.

MIDLAND CARNATION AND PICOTEE SOCIETY.—Mr. T. HUMPHREYS, the honorary secretary of this society, writes as follows:—"Owing to the exceptionally late season, the Annual Exhibition of Carnations, arranged to take place on July 31 and August 1, has been postponed until Thursday and Friday, August 8 and 9."

THE NEW YORK BOTANICAL GARDEN.—We note in an American contemporary that efforts are being made by the board of managers of the New York Botanical Garden to obtain special funds to supplement the ordinary income of the institution. These funds may bear in general such personal designations as the contributors may wish to indicate. Twelve foundations which are greatly desired are specified as follows:—Exploration fund, for which 250,000 dollars is needed; horticultural fund, 100,000 dollars; library fund, 50,000 dollars; conservatory fund, 50,000 dollars; herbarium fund, 50,000 dollars; lecture fund, 25,000 dollars; fund for the illustration of *North American Flora*, 30,000 dollars; scholarship funds, several foundations of from 10,000 to 25,000 dollars; laboratory fund, 20,000 dollars; fund for horticultural prizes, 10,000 dollars; fund for botanical prizes, 10,000 dollars; and research funds, are all set forth in a statement signed by ADDISON BROWN, chairman of the executive committee of the board of managers.

Publications Received.—*The Women's Agricultural and Horticultural Union Leaflet.*—*The Country Gentlemen's Estate Book, 1907*, price 10s. 6d.—*The Early Bird. How to Get Up Early*, published by David Nutt, price 1s.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

MAGNOLIA CAMPBELLII.—As you mentioned on p. 3 the fine flowering of this magnificent variety in my shrubbery in 1902, I may inform you that this was the only time it has done any good for me. In 1903-4-5-6 it set no buds, and in this spring, when it bore over 60 buds, none of them opened, owing either to late frosts or cold winds, which either burned or tore the soft and delicate petals borne, as your woodcut so well and accurately shows, on the topmost extremities of the branchlets. The portrait of this fine Magnolia in the *Botanical Magazine* does not do it adequate justice. Readers who have access to a botanical library, such as those at Kew and the British Museum, should refer to the splendid portrait of M. Campbellii in Cathcart and Hooker's *Himalayan Plants*, where it is figured on plates 4 and 5. I fear, however, we shall never see the species in such excellence in our uncertain climate. W. E. Gambleton.

THE RAINFALL IN JUNE.—It is interesting to remark that the rainfall for June, namely, 1.45 in., was less than that for June last year, when the fall was 2.41 in. The weather has been dull, but there has not been an excessive quantity of rain. W. A. Cook, *Leamdown Gardens, Sussex*.

ARALIA MOSERI.—Will A. H. (see p. 20) kindly point out in what respect the variety of *Fatsia japonica* (Aralia Sieboldii) known as Moseri differs from the ordinary type? *Ignoramus*.

This is decidedly an improvement on the normal form. The leaves are larger and more regularly lobed, and the plant is shorter jointed. I at first thought that the system of culture had made the difference, but afterwards found that the two growing side by side were quite distinct, although no botanist would recognise the distinction. As a market plant the variety is a decided improvement on the type. It has come into commerce since I discontinued the cultivation of such plants, but if I were now in the trade I should certainly discard the original type and grow the variety Moseri, if seeds are procurable, even if the cost were much greater. A. H.

STRAWBERRIES LEADER OR KENTISH FAVOURITE.—In last week's issue I referred to Kentish Favourite Strawberry as having received an Award of Merit from the R.H.S. Fruit Committee, and stated that the committee wished

plants to be sent to Wisley Gardens for trial. On Friday, the 5th inst., a sub-committee visited Wisley (see p. 38), and amongst varieties of Strawberries that attracted attention for heavy cropping and general excellence, including earliness, was Laxton's Leader, a variety not yet widely known. The foliage of the variety was distinctive, and the crop was remarkable. A little farther on was Kentish Favourite, and this was in every respect so complete a duplicate of Leader that the committee unanimously agreed the two were identical. It is worthy of note that when Kentish Favourite was exhibited at the Temple Show, Mr. Laxton declared it to be Leader, and the trial at Wisley proves that he was right. Such being the case, and the variety Leader having already received an Award of Merit, it is obvious that the new award under the later name cannot stand. The growing of Strawberries at Wisley for trial has thus been thoroughly justified, and has enabled a mistake to be rectified in good time. A. D.

SUMMER PRUNING OF FRUIT TREES.—It is satisfactory to know that in the majority of cases summer pruning, as carried out by the skilled practitioner, is a success. Judging, however, from the dates given by the various correspondents, it is evident that a considerable amount of growth is permitted before the shoots are pruned. A great amount of the tree's energy is thus thrown away, and a decided check is given to the tree in the removal of so much foliage. In some cases, in order to make the trees symmetrical and tidy, the side shoots are pruned to two buds, with the consequent result that the dormant buds break into growth and the tree is quickly transformed into a thicket of shoots. Early stopping the new growths with the finger and thumb is a much better practice, and it can be carried out more expeditiously than pruning with the knife. In these gardens the trees are gone over early in the season, and when the shoots have made from six to eight leaves they are pinched back to within four or five leaves, according to the vigour of the individual tree. These shoots break into growth again usually from the two top buds, and these secondary shoots are pinched again to two leaves. Some varieties of Pears form fruit buds the same year. By this system of pinching the trees receive no check, and the result is that the side shoots are kept within bounds, whilst extra vigour is thrown into those retained for extension. Thorough and early maturation of these shortened growths is brought about by the sun and air, which can freely reach them the entire season through. I have no hesitation in stating that the qualifying term "good," given by many of the correspondents, would have been preceded by "very" if early pinching of the growths were periodically practised. W. H. Clarke, *Aston Rowant, Oxon*.

—Mr. Lewis Castle asks (p. 424) a few pertinent questions regarding the practice of summer pruning of fruit trees, and Mr. A. Dean gives a clear and definite answer to his questions in last week's issue (p. 14). As I have practised the system for nearly 40 years, not only on wall trees, but also on standard, bush and pyramid fruit trees, I may be allowed to supplement Mr. Dean's remarks on the subject. My experience proves that the check, which the pinching or pruning back of the young growths to 6 or 9 inches of their origin involves, causes not only the formation of fruit buds, but also the development of dormant intervening buds, and thereby a percentage of these also become fruit buds and bear fruit in the following year. Summer pruning not only aids in the formation and plumping of fruit buds, but the practice also promotes a balance of growth in the trees operated on. Moreover, summer pruning, by temporarily diverting the flow of sap, and at the same time admitting more light to the trees, conduces to the swelling and ripening of the present season's fruit. The stopping of the young shoots, when from 18 to 24 inches long, of Fig trees trained against walls will result in the production thereon of embryo fruits, which will develop and ripen in due time. Some of the strongest growths on young fruit trees which I stopped about the middle of last month have already developed miniature fruit buds, while an examination of the unstopped shoots reserved for supplying buds for budding purposes have wood buds only. H. W. Ward, *Lime House, Rayleigh*.

ROYAL HORTICULTURAL SOCIETY.

Summer Show at Holland House.

(See also article on p. 30.)

JULY 9, 10.—This society's summer exhibition took place on these dates in the grounds of Holland House, and the function must be again declared a success. The weather on the opening day was fair, and at intervals the sun shone brightly, but at other times the interior of the tents was dark. The general opinion was that this was the best summer exhibition held by the society, and certainly the exhibits were equal in quality to any that have been seen at Holland House. As the grounds of this beautiful residence are large, the crowding which unavoidably takes place at the Temple Flower Show is not found here, and visitors can inspect the exhibits with comfort. The arrangements for such an exhibition necessitate much extra work on the part of the secretaries and staff, for on this, as on former occasions, everything had been done to make the event an agreeable one. It is very satisfactory that we are able to note that a special tent had been erected and was set apart for the exhibition of novelties submitted to the committees for certificate.

Floral Committee.

ROSES.

Messrs. PAUL & SON, Old Nurseries, Chesham, showed a beautiful exhibit of Roses. At the back of the display were tall pillar varieties in pots, and standard plants with bamboo epergnes filled with choice blooms were interspersed freely amongst vases and baskets filled with flowers of such beautiful kinds as Mrs. W. J. Grant, Mrs. John Laing, Frau Karl Druschki, Ulrich Brunner, Laurette Messimy (charming in the bud), La France, Heinrich Schultheis, Marquise Litta, &c. We also noticed the single Gottfried Kellar, Rosa sericea pteracantha, Goldfinch (new), The Wallflower, handsome climbing Rose, Una, &c.

Messrs. W. PAUL & SON, Nurseries, Waltham Cross, Herts., showed very fine blooms of H.P. and H.T. Roses in new and old varieties. The varieties Mad. Jules Grolez, Leonie Lamesch, Antoine Rivoire, Königin Carola, Melanie Souper, D. R. Williamson, a fine, double, crimson flower, Dr. W. Gordon, and Pharisæer were very choice. Roses generally were lavishly displayed by this firm.

Messrs. WM. CUTBUSH & SON, Highgate, London, N., filled one corner of the large tent with Roses and Carnations, with a few Codiaëums (Crotons), Dracænas, &c., as foils. This was a most pleasing group, effectively staged. There were banks of Carnations in a setting of the dwarf Polyantha Rose Mrs. W. H. Cutbush, with other taller Roses at intervals, principally climbing varieties, and a pleasing change was afforded in a bank of the yellow Calla Elliottiana, and another of Verbenas. The Carnations were especially fine. We have space only to mention a few of the choicest, such as Mercia, Maggie Hodgson, the darkest of the Souvenir de la Malmaison type; Baldwin (rose), King Arthur, a bright, scarlet-coloured border variety, Lady Hermione, and Yellow Gal. The new Rambler Rose Paradise was shown well in this group.

Messrs. H. MERRYWEATHER & SONS, The Nurseries, Southwell, Notts., exhibited excellent Roses of most sections; two boxes of H.P.s and H.T.s, 36 in all, consisted of very fine blooms. This firm showed a Polyantha Rose named Phyllis, a semi-double flower of deep pink colour, flowering in large clusters.

Messrs. W. and J. BROWN, florists, Stamford, showed popular varieties of the Rose in close bouquets, with many good flowers among them. This exhibitor also had Trachelium cœruleum, Verbena Miss Willmott, blooms of many varieties of the "Cactus" Pelargonium, which are so much admired as cut blooms, plants of Lilium Szovitsianum, Heliotrope, &c.

Mr. CHAS. TURNER, the Royal Nurseries, Slough, made a very fine display with Roses in great variety, many perfect blooms being noted among them. He also showed many of the garden Roses so useful for making bouquets,

sprays, filling vases, or for training on walls and fences, pillars, &c.

Beautiful blooms of cut Roses were shown by Messrs. ALEX. DICKSON & SON, Belfast. Several novelties of the highest excellence were included (see Awards) in this choice exhibit, which included flowers of the varieties Richmond, Peggy Molyneux, Mrs. P. Blair, Lady Helen Vincent, Mrs. Harold Brocklebank (creamy-white), Dorothy Page Roberts (deep salmon, with recurving petals), &c.

Mr. R. CHAPLIN, Joyning's Nursery, Waltham Cross, had excellent examples of many Rambler kinds, also blooms of Caroline Testout, Mrs. W. Grant, Frau Karl Druschki, and others.

Roses and Sweet Peas were freely shown by E. E. GRIMSON, Esq., Sutton, Surrey.

Messrs. FRANK CANT & CO., Braiswick Rose Gardens, Colchester, had many fine cut Roses. Mrs. Harvey Thomas, Papa Gontier, Mrs. W. Grant, Lady Roberts, and the fine white Frau Karl Druschki being prominent varieties.

Messrs. B. R. CANT & CO., the Old Rose Gardens, Colchester, also set up a most admirable lot of Roses, among which Irish Elegance, Madame Ravary, Richmond, Dean Hole, Capt. Hayward, Mrs. Laing, Mrs. E. G. Hill, and others were seen.

HOBBIES, LTD., Dereham, Norfolk, made a very large exhibit of Roses principally of Rambler varieties. Many were shown as standards on tall, straight stems. The varieties Dorothy Perkins, Hiawatha, and Minnehaha were noteworthy among the climbers; there were also seen good blooms of La France, Liberty, Caroline Testout, Dean Hole, L'Innocence, Frau Karl Druschki, Papa Gontier, Bessie Brown, and Richmond.

Messrs. S. BIDE & SONS, Farnham, showed Rose Queen of Spain and a new seedling Tea variety named Mrs. Sophie Neate, a seedling from Mad. Lambard × Anna Olivier.

SOME CUT FLOWERS.

Sweet Peas were extensively displayed. Messrs. DOBBIE & CO., Rothesay, had a grand assortment of these popular flowers, all of the highest merit. Marble Queen, Jessie Cutbertson, King Edward VII., Dora Breadmore, Mrs. Collier, and Mrs. Hardcastle Sykes were some of the finer varieties in this very large display.

Messrs. WM. ARTINDALE & SON, Sheffield, had a comprehensive exhibit of tufted Pansies (Violas), some 100 or more examples being staged in the best condition.

Mr. H. B. MAY, Edmonton, showed cut Pelargoniums of good quality.

Tree Carnations from Messrs. HUGH LOW & CO. were extremely fine. This firm also displayed varieties of the Souvenir de la Malmaison section, as well as a representative collection of the American tree sorts.

A collection of Sweet Peas from Messrs. H. CANNELL & SONS, Swanley, was in every respect an excellent one. Among the best were those following: Miss Doris (rosy-carmine), Rosy Morn (fine colour), Cannell's White, Mrs. Robt. Cannell (rosy-salmon), Henry Eckford, &c. The blossoms and sprays were of superb quality.

Mr. W. H. PAGE, Langley Park Nurseries, Hampton, staged an admirable lot of blooms of Tree Carnations in the leading kinds. Enchantress was very fine, as were also White Lawson and President Roosevelt.

Carnations were also finely presented by Mr. A. F. DUTTON, Iver, Bucks. Christmas Eve is a very rich and good scarlet variety.

Mr. JARMAN, Chard, in addition to showing beautiful Roses, made a feature of some improved forms of the Sweet Sultans (Centaurea suaveolens vars.), which were greatly admired.

Messrs. G. STARK & SONS, Great Ryburgh, Suffolk, and Messrs. E. W. KING & CO., Coggeshall, Essex, each displayed Sweet Peas in many good kinds.

Sweet Peas were also well shown by Mr. W. BREADMORE, Winchester. Some 250 square feet of tabling was occupied by the choicest and best of these popular flowers.

Another handsome display of Sweet Peas came from Mr. HENRY ECKFORD, Wem, Salop, and here, too, many of the finest varieties were noted.

GROUPS OF PLANTS.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, staged handsome foliage plants of exotic species. Many flowering plants were interspersed in the exhibit; the centre was occupied by a group of Orchids, and there were also Cannas, Carnations, greenhouse Rhododendrons, Angelonia grandiflora, &c. Tall stands accommodated well-grown plants of Nepenthes, including a choice example of N. sanguinea, with well-developed pitchers. The foliage plants comprised Alocasias, Anthuriums, Marantas, Aralias, Dracænas, Codiaëums (Crotons), Ferns, &c. Notable plants were Alocasia macrorrhiza variegata, Codiaëum (Croton) Reidii, and Medinilla magnifica. Messrs. VEITCH also exhibited a collection of Carnations, and another of Roses.

Messrs. WM. BULL & SONS, King's Road, Chelsea, displayed ornamental-leaved stove and greenhouse plants. Dracæna Victoria was shown well in this group, also Alocasia Lowii grandis, Eugenia myriophylla, Asparagus Sprengeri variegata, Dracæna Prince Manouk Bey (with broad, dark-red leaves), Pandanus Veitchii, Aralia triloba, &c.

Mr. L. R. RUSSELL, Richmond, showed handsome foliage plants of stove and greenhouse species. In the centre of the exhibit was a large specimen of Dracæna Victoria, with healthy foliage to the ground level; another notable plant was Alocasia crystallina, with remarkably well-developed foliage. There were also seen well-grown specimens of Anthurium Veitchii, Aralia elegantissima, A. Veitchii, Dracæna Goldiana, Alpinia Sanderiana, Alocasia metallica, and many others of equal beauty.

Messrs. J. PEED & SON, West Norwood, showed Caladiums, not excessively large in size, but brightly coloured and very fresh in appearance. The varieties were numerous and represented the finer of these showy foliage plants. Rio de Janeiro (red with green markings), Princess Olga (dark red), Lady Dorrington (a pale green margin enclosing a red groundwork with darker spots), Silver Queen (a pale coloured variety), Gerard Dow, Pintado, Mme. J. R. Box, and John Peed are a selection. Messrs. PEED also exhibited a large number of Gloxinias, and a group of Carnations, principally of the Souvenir de la Malmaison type.

Messrs. JOHN LAING & SONS, Forest Hill, London, also displayed Caladiums. The group was accommodated in the corner of the largest tent, and was arranged so that the plants at the back were elevated and gradually sloped towards the foreground. Here again the colours were well developed, especially in the varieties Alexander III., King Haakon, and Louis Van Houtte.

Mr. W. ICETON, Putney, exhibited greenhouse flowering plants, Lilium lancifolium, auratum, and longiflorum, Hydrangea Hortensia (with blue flowers); H. H. Mariesii, with flat corymbs of flowers, having a row of pink outer flowers larger than those on the disc; and H. paniculata were all well displayed in a setting of small Palms, Grasses, Ferns, &c. The effect of the group was further enhanced by Lily of the Valley arranged on tall columns.

Messrs. R. & G. CUTBERT, Southgate, London, N., showed handsome flowering plants, including Hydrangea Hortensia, H. paniculata, Lily of the Valley, Statice Suworowi, Verbena Miss Willmott, Lilium auratum and other species, Roses, including standard plants handsomely flowered of Lady Gay, Dorothy Perkins, &c., the whole being enhanced with ornamental leaved Maples, Ferns, Caladiums, &c., and forming collectively an exhibit of great beauty.

J. GURNEY FOWLER, Esq., South Woodford (gr. Mr. Davis), displayed a collection of Selaginellas in more than 50 varieties. All types were represented from those with broad foliaceous growths to those with a moss-like habit.

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, exhibited choice Ferns; the display occupied an area of 600 square feet, a space sufficient to allow the plants to be displayed without crowding. The collection was especially rich in Platyceriums, Acrostichums, Davallias, and Adiantums. Some of the best shown were *Davallia solida superba* (a magnificent specimen), *Adiantum undulatum*, with kidney-shaped pinnæ; *Adiantum Veitchii*, a coloured Fern; *Acrostichum aureum*, *Lygodium japonicum*, *L. scandens*, *Nephrolepis exaltata todeoides*, *N. e. superba*, *N. Mayii*, *N. elegantissima* (this plant was nearly 5 feet across), and *Davallia Veitchii*. Messrs. MAY also displayed 130 varieties and species of hardy Ferns, amongst which was a very representative collection of Polystichums. In another tent Messrs. MAY exhibited Zonal Pelargoniums and other flowering plants.

HARDY PLANTS.

A special importance was attached to these plants this year, inasmuch as the Council set apart the "Sherwood Cup" in open competition to exhibitors of hardy plants and flowers, and it was a matter of some little surprise that a London amateur should secure the cup with a most excellent group. The cup was offered for the best collection of herbaceous and bulbous plants grown in pots or tubs, but a background of foliage plants was allowed. The conditions required the exhibit to be shown on a space not exceeding 400 square feet. J. BRADSHAW, Esq., The Grange, Southgate (gr. Mr. G. G. Whitelegge), was the successful exhibitor, with plants well cultivated and splendidly staged. Bold groups of *Liliums pardalinum*, *longiflorum*, *tigrinum*, *Hansonii*, and others constituted a notable feature. There were also Delphiniums in excellent condition, considering they were in pots; white and blue peach-leaved *Campanulas*, *Spiræas*, early *Gladioli*, *Iris lævigata*, *Pentstemon barbatus Torreyi*, *Heucheras*, &c. The method of staging constituted a delightful change from the conventional bank arrangement, and the groups, whether viewed from the full front or from the sides, was in every respect good.

Messrs. WM. CUTBUSH & SONS, Highgate, had also an admirable group, in which a far greater number of varieties were seen. A water garden in one corner, with *Iris lævigata* encircling the pool, was a very charming feature. Many very fine groups of *Liliums* were seen in this group, which was composed of beautiful and rare plants.

Messrs. WM. ARTINDALE & SON, Nether Green, Sheffield, was the other competitor.

Apart from these competitive groups, there were many other fine exhibits of hardy plants. Especially good was a group from Messrs. R. WALLACE & CO., Colchester, who had rich banks of *Lilium auratum*, *colchicum*, *Henryi*, *Martagon album*, *Washingtonianum purpureum*, and others; *Eremuri*, *Larkspurs*, early *Gladioli* of very fine quality, *Ixias*, Japanese *Irises*, and many other things, all in first-class condition.

Mr. J. H. BURROUGH, Ketton Cottage, Stamford, showed some half-dozen vases filled with the handsome yellow spikes of *Lilium colchicum*.

Mr. M. PRICHARD, Christchurch, Hants, had a very choice and extensive collection, including *Iris aurea*, *I. Kämpferi*, *Gaillardias*, *Astilbes*, *Kniphofias*, *Iris Monnieri*, *I. aurea* (both in grand form), *Delphinium King of Delphiniums*, many choice *Liliums*, water plants, &c.

Messrs. BARR & SONS, Covent Garden, made a big display with *Ixias*, *Poppies*, early *Gladioli*, *Pæonies*, *Liliums*, *Heucheras*, English and other *Irises*, and other seasonable plants.

Mr. AMOS PERRY, Winchmore Hill, set up a most delightful water garden, which attracted much notice and which quite surpassed all his previous efforts in this direction. The arrangement was natural, and demonstrated that much is possibly in water gardening even within limited areas. The exhibit was one of the prominent features of the show. Mr. PERRY also showed a selection of choice hardy herbaceous plants.

Messrs. G. & A. CLARK, LTD., Dover, contributed a very fine group of hardy perennial

and Alpine plants, Sweet Peas, and other flowers. Delphiniums were finely displayed in this extensive exhibit.

Messrs. R. H. BATH, LTD., Wisbech, staged representative gatherings of *Roses*, *Sweet Peas*, *Delphiniums*, and *Carnations*, all of much excellence.

A very fine group of hardy flowers was shown by Messrs. GEO. JACKMAN & SON, Woking. *Pæonies* were particularly good in this exhibit; also *Larkspurs*, *Liliums*, *Iris aurea*, *I. Kämpferi*, and many others. A large display of cut *Roses* occupied one end of this group.

Messrs. T. S. WARE, LTD., Feltham, filled a considerable area with showy, flowering hardy plants, such as *Iris gigantea*, *Pæonies*, *Scabiosa caucasica*, *Romneya Coulteri*, *Dendromecon rigidum*, &c.

The Misses HOPKINS, Barming, near Maidstone, had a pretty group of Alpine and herbaceous plants, nicely arranged. Some excellent *Dianthus*, *Campanula Moerheimii*, and *Lychnis Haageana* were among the more conspicuous subjects.

Mr. HOWARD H. CRANE, Highgate, N., showed a charming collection of Tufted Pansies (*Violas*) in conjunction with their miniature congeners the *Violettas*. The latter plants are really Alpine in character, and they carpet the soil with their dense, bright-green tufts of leaves, above which rise the dainty blossoms. The colours embrace rosy-mauve, blue, yellow and gold, white and yellow—some were perfect bicolors. In all forty named varieties of the two flowers were exhibited.

Mr. G. REUTHE, Keston, Kent, had a most interesting and varied group, and one in which the specialist in Alpines and rare shrubs found much that was interesting.

Messrs. PAUL & SON, Old Nurseries, Chess-hunt, showed a splendid lot of *Pæonies*, *Iris gigantea*, *Heucheras*, and flowering sprays of *Lonicera Hildebrandtii*.

Messrs. WILLIAM BULL & SON, Chelsea, had collections of early *Gladioli* and English *Irises*.

THE GUILDFORD HARDY PLANT CO., Guildford, displayed a very interesting group of plants—*Echeverias*, *Irises*, especially *I. aurea*, *I. ochroleuca*, *I. longipetala*, &c.

Messrs. GEO. BUNYARD & CO., Maidstone, had a most extensive array of hardy flowers, including English *Irises*, *Romneya*, many choice *Liliums*, lovely gatherings of *Iris Monnieri* and *I. x Monspur*, *Potentillas*, *Larkspurs*, &c.

Messrs. BLACKMORE & LANGDON, Bath, had an excellent exhibit of *Delphiniums*.

MISCELLANEOUS.

Messrs. H. CANNELL & SONS, Swanley, Kent, showed 180 plants of *Cannas*. The method of arrangement was in rows, rising in tiers, which enabled the plants to be displayed to advantage. Several new varieties were included in the group, the most notable being those following: Dr. Balz (a crimson-scarlet variety, splashed with yellow), *Junata* (yellow self), Wm. Saunder (a variety of dwarf habit, with rosy-scarlet-coloured flowers, and bronze-shaded foliage), Dr. Budingem (one of the finest of all *Cannas*, with spikes of very large scarlet or crimson flowers), Frau Philipp Siesmayer (an improved form of Monte Rosa), Wm. Watson (salmon-buff), and Elfe (a shade of fawn, a new colour in these flowers).

Messrs. THOS. S. WARE, LTD., Feltham, made one of the largest displays of tuberous *Begonias*, containing many varieties under names. A pretty flower of canary-yellow colour was named Countess of Ilchester, another of an orange tint was Lady Treloar; Queen Alexandra is pink, edged with scarlet; Picotee is rather like the last-named, but is a neater flower.

Mr. A. LL. GWILLIM, Cambria Nursery, New Eltham, Kent, showed tuberous *Begonias* in both double and single-flowered varieties, with petals of clear and distinct colours. Margaret Gwillim is a beautiful double flower of a canary-yellow tint; Mrs. H. Harris is of a fine salmon-pink, with voluted petals, waved at the margin.

A large display of tuberous-rooting *Begonias* was made by Messrs. BLACKMORE & LANGDON, Tiverton, Bath, and the quality of the blooms was even better than in the foregoing. Like the other group, this one consisted of double flowers. Some varieties of a pendulous habit were shown as growing in wire baskets. *Fleur de Chrysantheme* was of these basket plants the more graceful and pleasing.

Mr. VINCENT SLADE, Staplegrove Nurseries, Taunton, showed a grand collection of Zonal *Pelargoniums*, some of the best we have ever observed, in 72 distinct varieties, and three of Ivy-leaved varieties, viz., *Her Majesty the Queen* (orange scarlet), *His Majesty the King* (bright scarlet), and *Ryecroft Surprise* (cerise).

Messrs. J. LAING & SONS, Forest Hill, showed *Begonias*, fine in regard to colour and form, of which were Earl Ducie, Lady Grenfell, and Lady Lichfield were the best.

Mr. C. TURNER, the Royal Nurseries, Slough, showed Pinks in self and laced varieties in large numbers.

Mr. W. H. PAGE, Tangley Nurseries, Hampton, made a large display of American *Carnations*, and these, being set in a bed of *Adiantum Fern*, had a beautiful effect.

A well-flowered batch of show *Pelargoniums* was arranged by J. A. YOUNG, Esq., Putney (gr. Mr. S. H. Street), and the same gentleman exhibited a group of *Carnations* of popular varieties.

Messrs. H. LOW & CO., Bush Hill Nurseries, Bush Hill Park, London, N., showed a number of fine plants of *Callistemon floribunda*; *Rose Baby Dorothy*, a variety very dwarf and free in flowering, the colour is pink; *Cassia corymbosa*, and a large number of *Carnations* of *Souvenir de la Malmaison* and American varieties.

Sir G. FAUDEL-PHILLIPS, Balls Park, Hertford (gr. Mr. Fitch), made a nice display with *Souvenir de la Malmaison Carnations* in cream, scarlet, crimson, and rose-pink tints.

Mr. T. A. HUMBERTON, Epping, Essex, showed a pink-flowered Zonal *Pelargonium*, raised from the white *Hermione*.

Messrs. THOS. ROCHFORD & SONS, Broxbourne, displayed a very large number of plants of the beautiful *Nephrolepis exaltata todeoides*.

Mr. R. RASMUSSEN, Eastville Nurseries, Waltham Cross, had a showy exhibit, consisting of single-flowered *Petunias*.

Mr. T. JANNOCH, the Lily Nursery, Dersingham, had a large exhibit of *Lily-of-the-Valley*, consisting of the "Fortin" variety, much the better one, and some of the Berlin variety, with smaller "bells." (Silver Banksian Medal.)

R. I. MEASURES, Esq., Camberwell, showed a large number of *Sarracenas*, *Droseras*, and *Nepenthes*, including several rare species.

AWARDS.

FIRST-CLASS CERTIFICATE.

Crinum Mearsii.—This is a miniature species. It was shown in a 60 pot, and was carrying two inflorescences, one of which had seven expanded flowers, the other six in the bud state. The plant was not more than 3 or 4 inches in height, and the spread of the foliage measured about 18 inches. The leaves are of the usual *Crinum* type, with somewhat wavy margins. The flower spikes are produced below the rosette of leaves, and they spring from the axils of the older scale leaves. The flower stalk terminates in an umbel, and each flower has a long calyx-tube that bears at its extremity a white perianth of linear segments, each about 4 lines in width. The stamens are dorsifixed; the anther filament is coloured red for about two-thirds of its upper portion, the lower portion being white. Shown by Col. BEDDOME, Putney.

AWARDS OF MERIT.

Crinum x H. J. Elwes.—This is a hybrid from *C. Moorei* x *C. americanum*. The inflorescence only was shown, and this had seven expanded flowers and a number of undeveloped flower-buds, the petals being of a bright shade of pink, similar to that of *Amaryllis Belladonna*, with paler, almost white, bases. Shown by the raiser, H. J. ELWES, Esq., Colesborne.

Delphinium Alake.—A variety remarkable for the size of its spike and individual flowers, some of which measured nearly 3 inches across. The outer row of petals are of a rich cobalt blue colour, the centre ones being violet-purple. The whole inflorescence formed a column of flowers 2 feet in length. Shown by Messrs. G. & A. CLARK, Dover.

Delphinium Rev. E. Lascelles.—A double-flowered variety of rich blue colour, with a white centre. The habit is very robust. Shown by Messrs. A. A. WALTERS & SON, Bath.

Hedera dentata variegata.—A variegated Ivy, with broad patches of silver in the older leaves, and glades of yellow in the younger. A

form of the well-known *H. dentata*. Shown by Mr. L. R. RUSSELL, Richmond.

Rose Joseph Lowe.—A hybrid Tea variety of rosy-pink colour, said to be a sport from the variety Mrs. W. J. Grant. The blooms possess handsome form, with somewhat conical centres. The inner surfaces of the petals are very pale, but the outer are a beautiful shade of pink. Shown by Messrs. LOWE & SHAWYER, Uxbridge.

Rose Goldfinch.—A rambler variety, with terminal corymbs of semi-double flowers that are of a coppery-yellow shade in the younger blooms, but which passes to a rich creamy white in the older flowers. Long growths were shown with their bases in water by Messrs. PAUL & SON, Old Nurseries, Cheshunt.

Sweet Pea Elsie Herbert.—A Picotee flower of the Countess Spencer type. The margins of the petals are tinged with rose, which fades in the centre of the flower to almost pure white. The blooms are very large. Shown by Mr. C. W. BREADMORE, Winchester.

Sweet Pea Princess Victoria.—Another flower of the Countess Spencer type, the petals being suffused with pink on a white ground, and showing an orange sheen. The flowers are very large, and are borne on long, stout stalks. Shown by Messrs. DOBBIE & Co., Rothesay and Mark's Tey.

Sweet Pea St. George.—A variety of orange colour, which fades in the older blooms to rose. The standards are waved. Shown by Messrs. HURST & SON, Houndsditch.

FIG. 13.—NEW HYBRID TEA ROSE LADY HELEN VINCENT, AWARDED THE GOLD MEDAL OF THE NATIONAL ROSE SOCIETY, AND AWARD OF MERIT OF THE ROYAL HORTICULTURAL SOCIETY; COLOUR A SHADE OF PINK.

Rose Lady Helen Vincent (see fig. 13).—The colour of this new Hybrid Tea Rose is a suffusion of delicate pink. The central petals form a pointed cone, but the outer ones droop and expand, giving the flower a very characteristic appearance.

Rose Souvenir of Stella Gray.—A Tea variety, with charming buds of a soft yellow shade; when open the petals assume a ruddy bronze tint. The blooms are of small size.

Rose Mrs. Munt.—A creamy-white hybrid Tea variety of first-class form. The petals expand well from the centre, and their edges are rolled backwards. The blooms are large.

Rose Mrs. Harold Brocklebank.—This is another hybrid Tea variety, with creamy-white petals, but of rather different build to the foregoing. It somewhat resembles the variety Duchess of Portland. These four Roses were shown by Messrs. ALEX. DICKSON & SONS, Newtownards.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, De B. Crawshay, H. J. Chapman, H. A. Tracy, F. Sander, H. G. Alexander, H. Little, T. W. Bond, W. H. White, W. A. Bilney, W. Boxall, W. Cobb, Jeremiah Colman, A. Dye, W. H. Young, H. T. Pitt, Norman C. Cookson, J. Charlesworth, F. M. Ogilvie, W. Bolton, H. Ballantine, and A. A. McBean.

At the entrance of the large tent, on the side devoted to Orchids, Messrs. SANDER & SONS, St. Albans, had an extensive and effective group rich in fine *Lælio-Cattleyas*, which were disposed in sections, the forms of L.-C. Martinetii and L.-C. Canhamiana being especially good. Two sets of varieties of *Miltonia vexillaria*, some with very large and finely-coloured flowers, were on each side of the centre of the group, and at

the back slender-sprayed *Oncidiums* and other species were arranged. Among the *Odontoglossums*, the fine new *O. Emperor of India*, a noble hybrid of unrecorded parentage, was the most striking; its very large and finely-formed flowers only slightly showed the white ground colour between the heavy blotching of rich claret-purple. It is a very remarkable break, and quite distinct from any variety previously shown. Of the *Cattleyas*, *C. Mossiæ Reineckiana excelsa* represented probably the finest known white-petalled *C. Mossiæ*, it being of the finest size and shape and devoid of the tendency to narrowness so common in white forms of *C. Mossiæ*. *C. M. Wagneri* was also a pure white flower of fine shape. Of hybrid *Cattleyas*, *C. Whitei*, Ronsele variety, raised by the Marquis de Wavrin, was remarkable for the almost uniform glowing rose-purple tint of its flowers, the only other colour present being the yellow disc to the lip and the white bases to the mid-ribs of the petals. Other pretty hybrids were *Cattleya Roehrsiana*, *Phaius Owenianus* (a very rich, reddish-crimson flower), *Cypripedium Lady Maple* (*Youngianum* × *Gowerianum*), *C. Ultor*, and many others. Among the species noted were the large and singular *Maxillaria Sanderiana*, a fine *Cœlogyne pandurata* (its large emerald-green and black flowers contrasting curiously with those of the pretty dwarf *C. Schilleriana*), *Cycnches chlorochilon* (the Swan Orchid), three plants of the rare *Ansellia nilotica*, *Galeandra Baueriana*, *Renanthera Imschootiana*, *Oncidium phymatophilum* (with branched spikes of insect-like flowers), and many other rare and interesting species.

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound), came next with a very fine group, at the back of which the bright, orange-scarlet sprays of *Epidendrum Boundii* mingled with the large, golden-coloured blooms of *Oncidium varicosum*, *O. macranthum*, and other elegant species. In the centre was the pretty Gatton Park form of *Lælio-Cattleya Canhamiana alba*, all with white sepals and petals and bright, crimson-purple lips. Beneath them was a selection of *Cypripedium niveum* and other dwarf kinds; on the sides were batches of the orange and crimson-coloured *Lælio-Cattleya Phœbe* and the rose and purple L.-C. *Martinetti*. At each end was a very fine selection of British Orchids, including *Aceras anthropophora*, *Ophrys apifera*, *O. muscifera*, and other of the insect-like species. In one part of the group plants of *Cypripedium callosum* *Sanderæ* and *C. Lawrenceanum Hyeanaum* were grouped together; in another the Gatton Park *Spathoglottis*, with their bright-yellow and crimson-tinted flowers, were effective. Well-grown plants of *Cochlidia Noezliana* afforded bright, orange-scarlet colour, and there were many brilliant varieties of *Masdevallia coccinea*. Of uncommon species noted were *Vanda Parishii*, *Phalænopsis Esmeralda*, *Pleurothallis macroblepharis*, *Oncidium Papilio*, *Masdevallia muscosa*, a very finely-grown plant of *Dendrobium McCarthia*, *Ancistrochilus Thomsonianus*, the pretty *Epidendrum prismatocarpum*, *E. alatum*, *E. umbellatum*, and other *Epidendrums*; a good selection of *Miltonia vexillaria*, including a good white form. Of the newer hybrids, *Lælio-Cattleya Geoffrey* was a pretty flower, and the new *Brasso-Cattleya Mary* secured an Award of Merit. (See Awards.)

Messrs. CHARLESWORTH & Co., Heaton, Bradford, staged a very fine group, the plants in which were of great merit and excellently well arranged. At the back were sprays of the fine white *Phalænopsis amabilis Rimestadtiana*, finely-flowered *Oncidium macranthum*, and other *Oncidiums*. In the body of the group were good representatives of most of the showy *Lælio-Cattleyas*, among which was the superb L.-C. *Canhamiana*, Rosslyn variety, for which a First-Class Certificate was given on May 31, 1904, and which has never been surpassed, its large, finely-formed, richly-coloured flower being unique in its section. Among forms of *Cattleya Mossiæ*, *C. M. Reineckiana King Edward VII.* was a grand white-petalled flower, *C. M. Wagneri*, a charming flower of pure white, and *C. M. Arnoldiana* a large white variety with a slight pink tinge on the petals and a purple-veined lip. *C. Warneri alba* appeared as one of the purest white and rarest *Cattleyas*, and *C. Mendelii mosaica* was a very remarkable pink and white bizarre-like flower, all the segments being variegated. Of hybrid *Odontoglossums*,

there were several new hybrids, including one derived from *O. Hallii* and *O. hastilabium*, a very distinct and pretty variety, also several *O. Phoebe*. Among the species were *Cœlogyne pandurata*, *Eriopsis rutidobulbon*, *Acanthophippium javanicum*, *Pescatorea cerina*, *Lycaste Deppei*, *L. aromatica*, the white *Habenaria Susannæ*, with a spike of five of its singular flowers; and a great variety of other interesting plants, including both hybrids and species.

In another tent Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, staged a good group, composed principally of *Cattleya Mossiæ* and *C. Mendelii*, one fine specimen of the latter having over 30 flowers, and another having very clear white blooms. At the back were the light spikes of *Oncidium Carthaginense*, *O. leucochilum*, *Odontoglossum hastilabium*, &c. At one end was a selection of singular species, including *Bulbophyllum Dearei*, *B. siamense*, and a form of *B. Lobbii*; also *Platyclinis filiformis*, the rare *Dendrobium Griffithianum*, and *Epidendrum nemorale*. At the other end was a batch of the orange-coloured *Epidendrum vitellinum*, and others remarked were *Cypripedium Schofieldianum*, *C. Gowerianum magnificum*, *C. macrochilum giganteum*, *Peristeria elata*, *Epidendrum Mooreanum*, and *Aerides japonicum*.

Mrs. ERNEST HILLS, Redleaf, Penshurst (gr. Mr. Ringham), showed a group of well-grown and profusely-flowered *Miltonia vexillaria*.

Messrs. STANLEY & CO., Southgate, staged a group of *Cattleya Mossiæ* and *C. Mendelii*, with which were arranged good plants of *Oncidium varicosum*, *O. leucochilum*, *Miltonia Binotii Harrisii* (of very fine colour), *M. Cogniauxiæ*, *Cypripedium Transvaal*, *Masdevallia maculata*, &c.

R. I. MEASURES, Esq., Camberwell (gr. Mr. Smith), arranged an interesting group of over 50 species, hybrids, and varieties, among which were *Cœlogyne pandurata*, *Brassavola Digbyana*, *Cypripedium Curtisii* Cambridge Lodge variety, and the green-tinted *C. C. viride*, various *Masdevallias*, *Cirrhopetalum Cumingii*, *Cattleya Mendelii*, *C. Mossiæ*, and several hybrids.

Messrs. JAS. VEITCH & SONS, in their fine group of ornamental plants, arranged an effective centre of Orchids, in which several forms of the showy *Sobralia Veitchii* were attractively displayed, also a very handsomely-blotched form of *Odontoglossum crispum*, with flowers of large size, good form, and fine markings; several of the spotted-lipped variety of *Oncidium sarcodes*, good *Cattleya Mendelii* and *C. Mossiæ*, *Platyclinis filiformis*, and a selection of *Odontoglossum crispum* of the white typical form.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya Warszewiczii* Mrs. Francis Wellesley, a large and finely-formed flower of the lightly-coloured type known as *giganteum*. Its flowers are of good shape, the petals and lip being very broad. The sepals and petals are of delicate rose pink, and the lip is marbled and veined with purplish-rose with the usual light-coloured sides to the tube.

WALTER COBB, Esq., Normanhurst, Rusper (gr. Mr. C. J. Salter), showed *Odontoglossum Cobbianum*, a fine large flower of the *O. Othello* class, with strong evidence of *O. Harryanum* parentage in its handsome flower.

W. P. BURKINSHAW, Esq., Hessle, Hull, showed *Cattleya Mossiæ Reineckiana superba*.

J. W. JESSOP, Esq., Cliff Cottage, Rawdon, Leeds (gr. Mr. Wilkinson), sent a grand specimen of *Aerides multiflorum Lobbii*, with three spikes of its pretty rose and white flowers, the longest spike being branched and 2 feet in length.

Monsieur A. A. PEETERS, Chaussée de Forest, Brussels, showed *Odontoglossum crispum* La Dame Blanche, a very fine, clear white variety of the *O. c. xanthotes* class.

AWARDS.

FIRST-CLASS CERTIFICATE.

Lilio-Cattleya (*live*, *Lambeau's variety* (*L. pulma prestans* × *C. Dowiana aurea*), from Monsieur LAMBEAU, Brussels. A very remarkable form, much taller in growth and larger in the flower than any which have previously been shown. Sepals and petals deep purplish rose; the finely displayed lip is a shade of ruby-crimson, with gold lines from the base to the centre.

AWARDS OF MERIT.

Cymbidium Humboldtii, from Monsieur PEETERS, Brussels. A remarkable species

from Madagascar, with pale Apple-green flowers, the bases of the petals and the lip having blackish markings. The flowers bear some resemblance to those of *Cœlogyne pandurata*. It was shown by C. L. N. INGRAM, Esq. (gr. Mr. T. W. Bond), as *C. Loise-Chauvieri*, June 7, 1892, when it was awarded a Botanical Certificate.

Brasso-Cattleya Mary (*B. nodosa grandiflora* × *C. Lawrenceana*), from JEREMIAH COLMAN, Esq., Gatton Park (gr. Mr. W. P. Bound). A very pretty and distinct hybrid raised at Gatton Park, with flowers about 2 inches across, and shaped nearest to those of the *Brassavola* parent. The flowers are of cream white, lightly spotted with purple on the sepals and petals, and tinged with the same colour at the back. The lip is trumpet-shaped, white, spotted with bright rose-purple.

Fruit and Vegetables.

A group of fruit trees, principally in 12-inch pots, was sent by S. HEILBUR, Esq., Holyport, Maidenhead (gr. Mr. Camp). Several of the trees were fully 7 feet in height, and all were well fruited, and especially the Cherries. There were Brown Turkey Figs, Black Bigarreau, Bigarreau Napoleon and Emperor Francis Cherries, Early Rivers Nectarine, and Peregrine Peach. It was unfortunate that this collection had not one face only, as being disposed with two fronts, its excellence was much hidden.

Messrs. G. BUNYARD & CO., Maidstone, had also a collection of fruit trees in pots. There were some 36 trees, but they were much smaller than those in the foregoing exhibits, and in 10-inch pots. Their height ranged from 3 to 5 feet. The fruits included Cherries Geant de Hedelfingen, Bohemian Black, Black Eagle, Noble, and Turkey Heart (black), and Governor Wood, Emperor Francis, Windsor, Florence, and Alton Heart (reds); Peaches Duchess of Cornwall, Duke of York, and Earliest of All; Pears Marguerite Marillat and Louise Bonne of Jersey; and Apple Beauty of Bath. All these trees were well fruited. The collection also had dishes of well-kept Apples, including the varieties Gooseberry, Calville Malingre, Calville des Femmes, very fine and firm, Belle du Bois, Alfriston, Costard, Calville Rouge, Murfitt's Seedling, and Smart's Prince Albert. There were also numerous dishes of Strawberries, including Leader, Louis Gauthier, Sir J. Paxton, Trafalgar, Dumbarton Castle, Royal Sovereign, Bedford Champion, President, Givon's Late Prolific, Reward, and others; also several dishes of Cherries and of Black Currants, including the Boskoop Giant, Champion, and other better known varieties.

In a crowded position, Messrs. HUGH LOW & CO., Bush Hill Park, had a group of Fig trees in pots, each one carrying an abundance of small green fruits, but none were named.

GATHERED FRUIT was represented, otherwise than already mentioned, by a collection of Strawberries, staged by Messrs. LAXTON BROS., Bedford. Large baskets of very fine fruit of Bedford Champion, a new variety, were conspicuous. The new Reward was also shown in good form. Other varieties in smaller baskets or dishes were The Laxton, Sir J. Paxton, Royal Sovereign, Gunton Park, and Mentmore. Generally the fruits were very fine and well coloured.

VEGETABLES were limited to three bundles of very fine Asparagus from Mr. A. J. HARWOOD, Colchester, and to samples of the new Pea "Quite Content," shown under glass cases by Messrs. JAS. CARTER & CO., Holborn.

Groups of Plants Exhibited Out-of-Doors.

Messrs. J. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, exhibited many hardy plants of recent cultivation. The chief subjects were *Escallonia langleyensis*—this has flowers of crimson colour, and they are smaller than those of *E. macrantha*; *Fremontia californica* has chalice-shaped flowers of an orange colour—these are thickly clustered on the old wood; *Aconitum Hemsleyanum* is a tall climber from Western China, having light-blue-coloured flowers and digitate, palmate leaves. Other plants included *Clematis cœrulea odorata*, having dark-blue petals and conspicuous white stamens; *Lonicera tragophylla*, with numerous orange-coloured long, tubular flowers—it grows to a height of 20 to 30 feet; *Genista tinctoria flore pleno*; *Meli-*

osma myriantha, with close spikes of minute, white flowers; the variegated form of *Andromeda japonica*, *A. speciosa cassinifolia*; *Actinidia chinensis*—the young shoots and leaves of this plant are hairy and of a crimson tint; *Lonicera grata*, *Magnolia Thomsonii glauca*, *Cytisus Shipkaensis*—a variety having creamy-white flowers; *Ivies*, *Bambusas*, a few specimen Conifers, *Lilium speciosum Vitis Henryi*, &c. About 40 large potsful of Sweet Peas, very robust in growth and finely flowered, formed a pleasing feature of this exhibit.

Messrs. T. CRIPPS & SON, Tunbridge Wells Nurseries, showed a large group of Acers, mostly of Japanese origin, and amongst them were several fine specimens of *A. palmatum palmatifidum*, 7 feet in lateral diameter; *Retinospora obtusa Crippsii*, an effective, golden-leaved variety; variegated *Ulmus*, *Liquidamber*, *Sycamore*, and other species.

Messrs. J. CHEAL & SONS, The Nurseries, Crawley, Sussex, had a large exhibit of ornamental shrubs and trees, including Japanese Acers, *Quercus concordia*, *Ilex marmorata*, a variety with leaves edged and mottled with yellow; *Kalmias*, *Abies pungens glauca*, *Ruta graveolens variegata*, *Catalpa Kœhneri*, with a greenish-yellow border to the leaves; *Veronica Purple Queen*, a showy flowered variety; climbing Roses; purple Beech, *Salisburia adiantifolia*, Weeping Birch, *Acer Negundo variegata*, and other ornamental trees. This firm also exhibited a pergola made of Larch poles and pleasingly furnished with climbing plants in variety.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed very extensively tree Ivies having variegated foliage. The plants ranged from 1 foot to 8 feet in height, and they were robust and of fine colouring. He also showed two hardy, dwarf-growing Fuchsias, viz., *F. Americana gracilis* and *F. myrtifolia minor*, and the taller-growing *F. Riccartonii* "Fly-see."

Messrs. W. CUTBUSH & SON, nurserymen, Highgate, showed trained specimen Sweet Bays, and a large array of clipped trees in Box and Yew, having the form of coffee-pots, dogs, tables, chairs, sofas, various birds, dolphins, &c.

Messrs. W. FROMOW & SONS, Sutton Court Nursery, Chiswick, had a large number of Japanese Acers in variety and a number of Bamboos, *Retinosporas*, Sweet Bays, &c.

Messrs. SUTTON & SONS, the Royal Nurseries, Reading, showed, in a glass case placed under a tent open at the sides, a group consisting of tuberous-rooting Begonias of the finer double-flowered varieties, Gloxinias, Ferns, Caladiums, &c. *Nemesias* grouped at the four entrances to the tent were very pretty and floriferous as grown in small pots.

Messrs. JAMES CARTER & CO., High Holborn, London, filled a small tent near the entrance to the big marquee with showy flowering plants of tuberous-rooting Begonias and Gloxinias. They had also vases of Sweet Peas, and in one corner in the tent pink Petunias. Messrs. CARTER also showed their new culinary Pea Quite Content and Tomato Sunrise.

HORTICULTURAL SUNDRIES.

The very extensive lawns at Holland House enable the Society to invite exhibits of up-to-date and standard articles of daily use in the garden, such as tools, insecticides, pumps, sprays, tubs, pottery, garden furniture, &c.

Garden seats, tables, balustrading, &c., were shown by Messrs. CASTLES CO., LTD., 30, Radnor Street, Chelsea. These articles of garden furniture were made of teak wood from old ships.

Messrs. HEADLEY & EDWARDS, LTD., Cambridge, showed seats, tents, arches in iron, garden hose, and reels.

Messrs. DUNCAN TUCKER & SONS, LTD., Tottenham, N., exhibited a conservatory of good design, span-roofed garden frames, summer-house and seats.

Messrs. SHANKS, Arbroath and London, showed motor, horse, and hand mowers.

Messrs. STIFF & SONS, London, were exhibitors of garden pottery, such as vases and pedestals in cream and red coloured ware.

Messrs. INMANS & CO., Royal Rustic Works, Stretford, Manchester, showed rustic summer-houses, garden seats, vases, tables, etc.

Mr. H. SCOTT, Woodside, South Norwood, showed rustic work and summer-houses.

Messrs. LIBERTY & Co. showed rustic work, viz., bordering vases, &c. Messrs. GREEN showed lawn mowers in variety. Messrs. W. WALTERS & Co., Water Lane, Great Tower Street, E.C., exhibited screens, cupolas, and arches, some of the objects stained with carbolineum so as to show the grain of the wood.

Messrs. RILEY, Herne Hill, S.E., showed an enormous exhibit, consisting of arbours, arches, seats, and summer-houses.

Messrs. T. J. SYER & Co., 45, Wilson Street, Finsbury, E.C., showed ladders, steps, and a repairing bench (portable) for estate work. This firm also showed a considerable collection of tools and implements for garden use, including a malleable iron vice for fitting to a bench.

Mr. J. GEORGE, 14, Redgrave Road, Putney, had an extensive lot of gardeners' sundries of all sorts, including Orchid peat of fine quality, chemical manures, fumigating material, &c.

Mr. D. G. CORNWELL showed the "Handy Pack" basket for fruits, and cases to hold 50 baskets, and other items.

DE LUZY FRERES, 99, Lilford Road, Camberwell, showed portable spraying machines, fumigators, bellows, &c.

Mr. H. PATTISON, 1, Farm Avenue, Streatham, showed lawn boots for horses and donkeys, also weed extractors.

Mr. J. FINCHES, No. 3, Crown Buildings, Camberwell, S.E., showed the durable Acme labels for trees and pot plants.

Messrs. MERRYWEATHER & SONS, 63, Long Acre, W.C., displayed pumps and pumping engines for farm and garden use; also spraying machines for fruit trees, motor pumps, water hose, &c.

Mr. G. H. SAGE, 71, Manor Road, Richmond, had "flower displays" made of brass wire. He is agent for the sale of Wakeley's Hop Manure, of which samples were shown.

THE HARROW NURSERY Co. showed split bamboo blinds for use in glasshouse shading; they are very durable.

Messrs. W. WOOD & SONS, LTD., Wood Green, London, N., showed blind materials, woven, and of bamboo; manures, insecticides, hose for garden use, flower-pots, and pot-holders of iron, watering cans, pumps, fumigators, wood-wool in various colours; rugs, baskets, flower sticks, and tying materials.

Messrs. W. VOSS & Co., Glengall Road, Millwall, showed insecticides.

THE SOLDIERS' AND SAILORS' HELP SOCIETY had an exhibit of miscellaneous basket work, trays, &c.

Messrs. D. DOWEL & SON, Ravenscourt Avenue, Hammersmith, W., showed garden pottery.

Mr. F. HICKSON, Hampstead, showed Messrs. Valls and Co.'s "Beetlecuter," and various other insecticides.

THE ANGLO-CONTINENTAL Co. (late Ollendorff), 15, Leadenhall Street, London, showed chemical manures and Peruvian guano.

Messrs. W. HERBERT & Co., The Hop Exchange, S.E., showed sundries for the garden, chemical manures, insecticides, tools, &c.

Awards made by the Council.

THE SHERWOOD CUP.

J. Bradshaw, Esq.

GOLD MEDALS.

Jeremiah Colman, Esq.; Jas. Voitch & Sons, Ltd.; Paul & Son; Wm. Cutbush & Son; T. S. Ware, Ltd.; H. B. May & Sons; Amos Perry; Sander & Sons; R. Wallace & Co.; Alex. Dickson & Sons.

SILVER CUPS.

R. I. Measures, Esq.; S. Heilbut, Esq.; Geo. Bunyard & Co.; L. R. Russell; R. & G. Cuthbert; Hugh Low & Co.; Charlesworth & Co.; C. W. Breamore; T. Cripps & Sons, Ltd.; Dobbe & Co.; Barr & Sons; J. Laing & Sons; F. Lilley; Chas. Turner; H. Cannell & Sons; Hobbies, Ltd.; Frank Cant & Co.; R. C. Notcutt; M. Pritchard; Wm. Artindale & Sons; and Blackmore & Langdon.

SILVER-GILT FLORA MEDALS.

R. H. Bath, Ltd.; G. Jackman & Son; John Peed & Son; J. Cheel & Sons; Kelway & Son; E. W. King & Co.; James Carter & Co.; G. and A. Clark, Ltd.; B. Ladhams, Ltd.; Wm. Paul & Son; J. Gurney Fowler, Esq.; W. Fromow & Sons; and G. Reuthe.

SILVER-GILT KNIGHTIAN MEDAL.

Messrs. Laxton Bros.

SILVER-GILT BANKSIAN MEDALS.

Messrs. Sutton & Sons; E. E. Grimson; B. R. Cant & Sons; A. J. Upton; A. F. Dutton; and Sir Geo. Faudel-Phillips.

SILVER FLORA MEDALS.

Messrs. Gunn & Sons; Wm. Bull & Sons; T. Rochford & Sons, Ltd.; Lt.-Colonel Heseltine; A. L. Gwillim; W. Icton; J. Forbes; and Mr. Page.

SILVER KNIGHTIAN MEDAL.

Mr. A. J. Harwood.

SILVER BANKSIAN MEDALS.

Mr. Burroughs; W. R. Chaplin; H. C. Pulham; H. H. Crane; H. Merryweather & Sons, Ltd.; G. Stark & Son; S. Bide & Sons; Misses Hopkins; V. Slade; W. J. Godfrey; T. Jannoch; Stanley & Co.; and Mrs. E. Hills.

HORTICULTURAL SUNDRIESMEN.

SILVER-GILT FLORA MEDALS.

Mr. G. W. Riley, and W. Wood & Son, Ltd.

SILVER-GILT BANKSIAN MEDALS.

Messrs. Merryweather & Sons, Ltd.; Innams & Co.; T. Green & Son, Ltd.; and Ransomes, Sims, & Jefferies, Ltd.

SILVER FLORA MEDALS.

Mr. H. Scott; Castle's Shipbreaking Co., Ltd.; Pulham & Son; A. S. Shanks & Son, Ltd.; J. George; Headley & Edwards, Ltd.; M. S. Watts; D. Tucker & Sons, Ltd.; Liberty & Co.; and T. J. Syer & Co.

SILVER BANKSIAN MEDALS.

Messrs. Champion & Co.; D. Dowel & Son; Herbert & Co.; and J. Siff & Sons.

BRONZE BANKSIAN MEDALS.

Abbott Bros.; G. H. Sage; W. Voss & Co.; Gillard & Co.; Walters & Co.; and J. Williams.

FRUIT AND VEGETABLE COMMITTEE'S VISIT TO WISLEY.

JULY 5.—Eight members of the Fruit Committee of the R.H.S. travelled to Wisley on this date to inspect the collection of Strawberries. The sub-committee consisted of Mr. O. Thomas (chairman), and Messrs. Markham, Allan, Bates, Foster, Dean, Kelf, and Rivers. The soil at Wisley is sandy, but Strawberries do well in it, the exceptions being a few that need stiff land. The varieties Leader and Kentish Favourite were both carrying heavy and early crops. Royal Sovereign proved one of the very best of the varieties inspected. Fillbasket was carrying a heavy crop, but the fruits were late in ripening. Monarch, President, Bedford Champion, La Grosse Sucrée (the earliest to ripen), and Latest of All were bearing large crops. Most of the plants were two years old. No award was made to a variety. The collection of Rhubarb close by was also examined, and it was agreed that the best kinds as seen were Daw's Champion, Allis's Champion (scarcely as good as the first named), Crimson Perfection, Paragon, and Victoria. It was considered that a selection of half a dozen varieties would embrace sufficient for all purposes, and that the rest might be dispensed with. Edible Peas do not form a special trial this year, but Dwarf Kidney Beans, Onions, and Potatoes were all looking extremely well, and promise to furnish capital trials. In a few cases, "curl" is much in evidence in Potato haulm, and in this connection it would be interesting to know where the seed tubers of these diseased plants were grown, in what kind of soil, and the general character of the stocks from which they were derived. In the houses a primary feature is a trial of Melons, all the plants being of exceptionally good culture. The fruits should be ready for inspection by the end of the present month.

NATIONAL ROSE.

JULY 4.—In our last issue we were enabled to publish some of the awards made at this show, but consideration of time precluded us from giving a detailed report.

NURSERYMEN'S CLASSES.

In the important class for 72 blooms of distinct varieties, the 1st prize in which included the Champion Challenge Trophy, Messrs. HARKNESS & Co., Hitchin, were placed 1st. Their exhibit included the best Hybrid Tea Rose in the show, and to this a Silver Medal was awarded. Other fine blooms were shown in the varieties Comte de Raimbaud, Duke of Teck, Robert Scott, Bessie Brown, Suzanne Marie Rodocanachi, Ulrich Brunner, Marie Baumann, Mrs. T. Roosevelt, Duke of Edinburgh, Mrs. Sharman Crawford, Gustave Piganneau, Dupuy Jamain, Gloire de Margottin, and J. B. Clark. 2nd, Messrs. B. R. CANT & SONS, Colchester, with a very even and regular collection of flowers, consisting of H.P., T., and H.T. varieties. The following were the best examples shown: C. J. Graham, Marquise Litta, Gustave Grunerwald, Marechal Niel, Florence Pemberton, Madame Eugenie Verdier, Medea, Lady M. Beaucherc, Betty, White Lady, Ulster, Crown Prince, Ulrich Brunner, and A. K. Williams. 3rd, Messrs. F. CANT & Co., Braiswick Nursery, Colchester. There were two other exhibitors in this class.

A class was also provided for 48 blooms in distinct varieties. The 1st prize was won by Mr. G. MOUNT, Canterbury, with large, perfect flowers of well-assorted colours, of which we admired General Jacqueminot, J. B. Clark, Ulrich Brunner, Commandant Felix Faure (a very dark, velvety bloom), W. J. Grant, Richmond, Prince de Bulgarie, Fisher Holmes, Mrs. Sharman Crawford, Horace Vernet, Dean Hole, Duke of Teck, Marquise Jeanne de la Chataigneraye, Duke of Teck, and Hugh Dickson. 2nd, Messrs. G. PRINCE & Co., Longworth, Berks., with a superior lot of H.T.s, T.s, and H.P.s, including fine blooms of Bessie Brown, Comtesse de Nadaillac, Maman Cochet, Ulrich Brunner, Mrs. E. Mawley, and Lady Ashtown. 3rd, Messrs. J. BURRELL & Co., Cambridge.

The smaller class for 16 distinct varieties, three blooms of each, resulted in Mr. G. MOUNT, Canterbury, being placed 1st, with a very excellent boxful, consisting of the varieties J. B. Clark, Liberty, Hugh Dickson, Frau Karl Druschki, Chas. Lefebvre, Caroline Testout, Mildred Grant, Mrs. W. J. Grant, Mrs. John Laing, Duke of Edinburgh, Ulrich Brunner, and White Lady. 2nd, Messrs. J. BURRELL & Co., Cambridge, whose exhibit included blooms of Mrs. Ed. Mawley, Ulrich Brunner, and Hugh Dickson. 3rd, Messrs. G. and W. H. BURCH, Peterborough.

TEA AND NOISETTE SECTION.

In the class for 24 blooms of distinct varieties, to which allusion was made in last week's issue, the D'Ombra Challenge Cup, as well as the 1st prize, was awarded to Messrs. G. PRINCE & Co., Longworth, Berks.

Twelve Tea or Noisette blooms, distinct.—1st, Messrs. BURRELL & Co., in whose box the best Tea Rose was shown, viz., Mrs. Edward Mawley, to which a Silver Medal was awarded. The 2nd and 3rd prizes fell to Mr. J. MATTOCK and Mr. G. MOUNT, in the order of their names.

Fourteen varieties distinct, three blooms of each.—The 1st prize was won by Mr. GEO. PRINCE, who had in this competition many of the varieties that he showed in others, the exceptions being Bridesmaid, Madame Cusin, E. V. Hermanos, Lady Mary Corry, and Madame J. Graveaux. Mr. PRINCE states that he uses as a stock the seedling briar, Roses on this stock being the earliest and the latest to bloom. 2nd, Messrs. F. CANT & Co., whose blooms of Souvenir d'un Ami, Mrs. E. Mawley, Golden Gate, and Maman Cochet were very fine. 3rd, Mr. H. DREW.

ROSES IN VASES.

The principal class for Roses in vases was that for twelve distinct varieties, seven blooms of each, to include not more than six blooms of Teas or Noisettes. Mr. GEO. MOUNT won the 1st prize with good quality blooms of Mrs. W. J. Grant, the lovely blush-coloured Mabel Grant, Bessie Brown, J. B. Clark, Capt. Hayward, Dean Hole, Frau Karl Druschki, Killarney, and Mrs. John Laing. 2nd, Messrs. D. PRIOR & SON, Colchester, who showed fine blooms of Mrs. S. Crawford, Bessie Brown, Frau Karl Druschki, Liberty, and General Jacqueminot. 3rd, Messrs. F. CANT & Co.

Nine distinct varieties of Teas and Noisettes, seven blooms of each.—1st, Messrs. GEO. PRINCE & Co., with a beautiful lot of blooms, of which the following were the finer:—Maman Cochet, Anna Olivier, Mrs. E. Mawley, Souvenir de Pierre Notting, and Comtesse de Nadaillac, this last being of extra fine quality. 2nd, Mr. H. DREW, Longworth, Berks., with excellent flowers of white Maman Cochet, Comtesse de Nadaillac, Mrs. E. Mawley. 3rd, Messrs. F. CANT & Co., Colchester. There were five competitors in this class.

Eleven distinct varieties, not fewer than three sprays of each.—1st, Mr. J. MATTOCK; 2nd, Mr. G. PRINCE, who showed his blooms on very long stalks in metal holders 2½ feet high; 3rd, Mr. G. MOUNT, who showed blooms in close bouquets and long sprays on boughs.

DECORATIVE ROSES.

In the class for six distinct varieties, that were required to be shown on a bamboo stand, Mr. G. MOUNT won the 1st prize with the varieties Laurent Messimy, Marquise de Salisbury, Queen Mab (a China Rose), Claire Jacquier, Mme. Abel Chatenay, and Evergreen Gem. 2nd, Messrs. GEO. PRINCE & Co.

OPEN CLASSES.

Eighteen blooms of any crimson Rose.—1st, Messrs. D. PRIOR & SON, with the new variety Liberty; 2nd, Mr. G. MOUNT, with Richmond; 3rd, Messrs. R. HARKNESS & Co., with Ulrich Brunner.

Eighteen blooms of any white or yellow Rose.—1st, Messrs. BIDE & SONS, Farnham, Surrey; 2nd, Messrs. D. PRIOR & SON, with Frau Karl Druschki; 3rd, Messrs. B. R. CANT, with Countess of Derby.

Eighteen blooms of any Rose other than a white, yellow or crimson variety.—1st, Messrs. J. BIDE & SONS, with Queen of Spain, a handsome, compactly-formed flower of the palest flesh tint; 2nd, Messrs. F. CANT & Co.

AMATEURS.

Open to growers of fewer than 500 plants.—Mrs. E. HORNE, Park House, Reigate, staged the best blooms in the class for nine blooms of distinct varieties, having large, almost perfectly-formed blooms of T. and H.P. varieties. A piece of plate given by L. S. PAWLE, Esq., accompanied the 1st prize.

An extra class was provided for amateurs.—This was for 24 blooms, distinct. The 1st prize was awarded A. LEGGETT, Esq., 24, Macedon Road, Colchester, for very good blooms of T. and H.P.s., some being equal to any in the show; 2nd, H. W. RICHARDS, Esq., Westridge, Ryde, with an excellent, even lot of flowers.

Twelve blooms, distinct varieties.—1st, A. TATE, Esq., Downside, Leatherhead, who was awarded a Silver Cup; and his bloom of Mamie—a full, pink-coloured Rose—was awarded a Silver Medal, as being the best Rose other than Tea or Noisette in the show; 2nd, E. B. LINDSELL, Esq., Hitchin, Herts.

Nine Teas and nine Hybrid Tea blooms.—O. G. ORPEN, Esq., was placed 1st for good flowers, but they were unequal in size; 2nd, Mr. J. WAKELEY, Rainham, Kent.

Six new Roses, distinct.—The 1st prize was won by E. J. HOLLAND, Esq., Sutton, Surrey, with good blooms of Dean Hole, Hugh Dickson, Mrs. J. Bateman, Mrs. Theodore Roosevelt, J. B. Clarke, and Lady Ashton. A piece of plate presented by Mr. HUGH DICKSON, Belfast, went with this prize.

TEA AND NOISSETTE ROSES.

A. H. GRAY, Esq., Beaulieu, Bath, won in the class for 18 blooms of these varieties with shapely examples of moderate size. The National Rose Society's Tea and Noisette Challenge Trophy and Replica for Amateurs was included in the 1st prize; 2nd, Rev. F. R. BURN-SIDE, Great Stamburgh, Essex.

Twelve blooms of Tea and Noisette Roses.—1st, T. B. GABRIELLE, Esq., Hart Hill, Woking, whose flowers were all of high quality save two; 2nd, Dr. T. C. PALLETT, Earl's Colne, Essex.

A class was provided for growers of fewer than 100 plants.—1st, ALAN SEARLE, Esq., Ashton Lodge, Basset, Hants. This prize included a piece of plate given by the Prince Memorial Fund.

A class was also provided for exhibitors who have never won a prize at any exhibition of the Society. It was for six blooms of Tea or Noisette Roses in not fewer than three varieties.—1st, J. F. BLYTHE, Esq., Hill House, Nayland, Suffolk, whose best blooms were Mrs. E. Mawley, Medea, Midas, and Souvenir de S. A. Prince.

NEW ROSES.

Rose Queen of Spain.—A Gold Medal was awarded to this pale flesh-coloured H.T. variety, shown by Messrs. BIDE & SONS (see fig. in *Gardeners' Chronicle*, July 14, 1906, p. 33).

Rose Lady Helen Vincent.—A Gold Medal was also awarded for this new variety, which is illustrated at fig. 13. (See also description on p. 36.)

Cards of Commendation were awarded to Messrs. PAUL & SONS and Mr. H. E. WELLER for, respectively, "Goldfinch" and "Mrs. H. Weller."

NEW METHOD OF SHOWING ROSES.

The 1st prize and a Silver-Gilt Medal was gained by Mr. L. COLLETT, Nantwich, for an arrangement by which the flowers are placed in metal tubes secured by clips to a light iron frame that may be put to any angle.

An equal 1st prize was awarded Messrs. G. PRINCE & Co. for a somewhat similar arrangement.

A Card of Commendation was given A. HILL GRAY, Esq., Bath, for flower holders fixed in holes made in a sheet of looking glass.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JULY 8.—The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on the above date. Mr. Thomas Winter (vice-chairman) presided. Five new members were elected, and one nominated. The death certificate of Mr. Eli Cook, of Letton Court, Hereford, was produced. The sum standing to his credit in the society's books was passed for payment to his nominee, the amount being £36 4s. 4d. A cheque was granted to Mr. John Hy. Hodge, a lapsed member, having reached 60 years of age, the amount being £18 16s. 8d. The amount paid for sickness during the past six months has been heavy, compared with the corresponding period last year, as the following figures will show:—

	1906.	1907.
	£ s. d.	£ s. d.
February ..	21 7 0	February .. 55 6 0
March ..	29 15 0	March .. 49 3 0
April ..	30 4 0	April .. 43 2 0
May ..	29 8 0	May .. 52 0 0
June ..	20 10 0	June .. 24 8 0
July ..	20 18 6	July .. 17 2 0
	£152 2 6	£241 1 0

being a difference of £88 18s. 6d. in favour of 1906.

Obituary.

EUGENE-LOUIS-CELESTIN BARBIER.—We regret to announce the death of M. Barbier, a member of the firm of Barbier et Cie, nurserymen, Orleans, France. M. Barbier, who was 57 years of age, died on June 22, at Orleans.

CHARLES JORDAN, I.S.O.—Readers will regret to learn of the death of the able superintendent of Hyde Park, on the 9th inst. Only in our last issue we announced the honour conferred upon Mr. Jordan by his Majesty the King, and now it is our duty to chronicle his decease. Previous to his appointment at Hyde Park, the late Mr. Jordan was superintendent of Regent's Park, and whilst there he was selected by H.M. Office of Works to make the necessary alterations in the grounds of Holyrood Palace before they were thrown open to the public. Deceased had also much to do with the extensive alterations in St. James' Park necessitated by the national monument to Queen Victoria. Mr. Jordan was a member of the original committee of the British Gardeners' Association. The funeral will take place at 4.15 p.m. on Saturday, the 13th inst., at the City of Westminster Cemetery, Hanwell.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending July 10.

Still another cold and wet week.—This proved a cold week throughout, and was the fourth unseasonably cold one in succession. Since the month began there has not been a single unseasonably warm day, and only one warm night. As regards temperature the most noteworthy feature of the past week has been the uniformity of the highest day temperatures, which have ranged only between 59° and 64°. The ground readings are very low for July, the temperature at 2 feet deep being 6° colder, and at 1 foot deep 6° colder, than is seasonable. Rain has fallen on all but one day of the present month, but to the aggregate depth of less than three-quarters of an inch. So moderate have been the recent falls of rain that during the past four weeks there has been on no day any measurable percolation through the bare soil gauge. The sun shone on an average for 4½ hours a day, which is two hours a day short of the mean daily duration for the month. The winds were variable in force, but as a rule of moderate strength, and came almost exclusively from some southerly or westerly point of the compass. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 9 per cent.

JUNE.

An exceptionally cold, sunless, and windy June, with a remarkably frequent rainfall.—During the 21 years over which my records at Berkhamsted extend there has been only one June in which the mean temperature has been as low, and that was in 1903. Taking the day temperatures alone they were colder than in any June of the same period, whereas the nights were of about average warmth. On the warmest of the only two warm days the temperature in the thermometer screen rose to 72°, which is the lowest extreme maximum temperature I have yet recorded here in June. On the other hand, the lowest reading registered on the surface of the lawn, 36°, is an exceptionally high extreme minimum for the month. Rain fell on no fewer than 20 days,

and to the total depth of 2½ inches, or slightly below the June average. The sun shone on an average for 4½ hours a day, which is 1½ hours a day below the mean duration for the month. We have to go back 17 years in order to find as gloomy a June. In no previous June during the past 21 years has the wind been, as a rule, as high, and yet in no single hour did the mean velocity exceed 19 miles—direction W.N.W. The average amount of moisture in the air at 3 o'clock in the afternoon was 5 per cent, in excess of a seasonable quantity for that hour. E. M., Berkhamsted, July 10, 1907.

REMARKS.—Large quantities of Melons of good quality are arriving from Guernsey, but they are not selling freely. English Grapes and Peaches are plentiful, but the trade is very quiet for these fruits. Raspberries and Red Currants from Kent are now on the market. The first consignment for this season of Valencia Melons arrived this week. An unusual advance in the price of Onions for this season of the year is noticeable. Strawberries are plentiful and cheap. P. L., Covent Garden Market, July 10, 1907.

POTATOES.

Kents, 6s. to 8s.; Bedford's, 5s. 6d. to 6s. 6d.; Jerseys, 5s. 6d. to 6s.; St. Malos, 6s. to 6s. 6d.; Teneriffe, 8s. to 9s.; old Potatoes, 6s. 6d. to 7s. The market has now a good supply of English Potatoes, and these are meeting with a brisk demand. A. B., Covent Garden, July 10, 1907.

COVENT GARDEN FLOWER MARKET.

Business in pot plants is now falling off considerably. Good Mignonette is not plentiful, and Rhodanthe is over with most growers. Other plants almost finished for the season are Ericas, Boronias, and Saxifraga pyramidalis. Hydrangea Hortensia, with blue flowers, make the best prices. H. paniculata grandiflora is marketed in fine condition. Plants of H. H. Mariesi are also seen. Zonal Pelargoniums are plentiful in well-flowered plants. Some growers have finished with the Ivy-leaved varieties, and other stocks are very low. Show varieties are plentiful and good. Yellow Calceolarias are to be found in fine condition. Hybrid varieties of Crassulas are getting past their best, but C. coccinea is still good. Tuberous-rooting Begonias are plentiful; those in 48 and in 60 pots are equally good. Fuchsias, Marguerites (both yellow and white), Heliotropes, Harrison's Musk, and Lobelias are prominent plants in the market. The double-flowered blue Lobelia sell well when marketed in small plants, but plants in 48's have a slow trade. This is not surprising, as a demand for new plants does not exist until their merits have been proved, and buyers are loath to purchase plants except such as are well known.

CUT FLOWERS.

Hardy flowers are prominent at the present time, and they are more appreciated than they were some few years ago. Coreopsis grandiflora is a favourite subject and lasts fresh for a long time. Gypsophila is over plentiful. In choice flowers Liliun longiflorum may advance in price. Good blooms of L. lancifolium album were making 2s. 6d. per bunch this morning. Lily of the Valley is not abundant. Callas are seen; there is little demand for them. Some very fine varieties of English Irises are seen. Spanish Irises are still plentiful, also Gladioli in some of the best varieties of the Colville and Brenchleyensis types. A. H., Covent Garden, Wednesday, July 10, 1907.

ANSWERS TO CORRESPONDENTS.

ASTER: E. W. L. The stem has been hollowed out by some mining maggot that entered the plant at a point below the soil level.

BEST TIME TO PRUNE CERTAIN KINDS OF SHRUBS: E. B. Hollies, Yews and Box are best pruned in July. Laurels should be cut back early in spring before growth commences. It is always best to choose dull weather for carrying out pruning operations.

CUCUMBERS DISEASED: W. X. The plants are attacked by the fungus Cercospora melonis, which is generally favoured by the presence of too much moisture in the atmosphere, too free use of manure, and a deficiency of ventilation. Spray every portion of the soil in the house with the Bordeaux mixture once each week. Plants at present free from the disease should be sprayed with sulphide of potassium, 2oz. in three gallons of water, in which 2oz. of soft soap is dissolved. Infection can take place on the under surfaces of the leaves only, hence the fungicide should be well applied from below upwards. Use this solution every other day instead of water for the ordinary syringing. When this crop is finished thoroughly sterilise all parts of the house by drenching with Bordeaux mixture, and treat the soil with gas lime at least two months before it is placed in the house.

FLOWERING OF DASYLIRION ACROTRICHUM: Enquirer. Your plant should be treated as an ordinary greenhouse subject during spring and summer, when growth is taking place. During late autumn and winter less water will be needed at the roots and less moisture in the atmosphere, as it is only necessary at those periods to keep the plants from shrivelling. The production of such a strong inflorescence will entail a great strain on your plant, and you might therefore afford weak manure-water to the roots once each week. The flowers are small and dioecious, therefore no seeds can be expected.

GRAPES DISEASED: W. D. See answer to R. G. M. in our last issue, p. 20.

INSECTS ATTACKING BRUSSELS SPROUTS: W. H. The pests you send belong to the family of Turnip flies or flea-beetles (Phyllotreta). They lay their eggs on the leaves of the plants, and the grubs hatch later and mine in the tissue of the leaves, feeding upon the softer parts. These give rise to the small, jumping beetles, which also feed upon the same plants. These insects have been unusually abundant this year, though it is said that they do not injure crops—Turnips, Radishes, Cabbages, &c., in wet seasons! The beetles may be caught by gently tapping the infected plants over a freshly-tarred tray, board, or tightly-stretched canvas. The pests should be hunted at least twice a week until the plants have outgrown the attack. Soot placed about the plants is said to act as an excellent deterrent. If the land is poor in plant food, give it a dressing of artificial manure.

MELON: Banffshire. The stems are killed by the fungus—Hypocynus cucumeris. Spray the remaining plants with a solution of sulphide of potassium, employing ½ oz. of potassium in one gallon of water. Sprinkle the soil with crushed sulphate of potash, using 1 oz. of potash to the square yard.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers. PLANTS; J. M. L. 1, Sempervivum arboreum variegatum; 2, Begonia (garden Hybrid); 3, Abutilon Savitzianum; 4, Abutilon megapotamicum var. variegatum; 5, Selaginella caulescens; 6, Acalypha marginata; 7, Rhododendron hirsutum; 8, Berberis empetrifolia.

—J. M. Raphiolepis ovata.—Studdley Castle. Clytostoma notophyllum (Bur. et K. Schum). —J. H. C. 1, Aerides virens; 2, Eria acervata; 3, Epidendrum cochleatum.—R. D. Cyrtopodium pubescens.—T. L. A. 1, Aerides japonicum; 2, Bulbophyllum Careyianum; 3, Cirrhopetalum Mysorense; 4, Stelis ophioglossoides.—E. L. 1, Santolina incana; 2, Clematis integrifolia; 3, Habrothamnus (Cestrum) elegans; 4, Buddleia globosa; 5, Spiraea filipendula flore pleno; 6, Send when in flower.—V. A. 1, Cattleya Forbesii; 2, Lælia Dayana; 3, Oncidium flexuosum; 4, Pleurothallis obovata; 5, Masdevallia simula; 6, Brassia verucosa.—E. N. Oncidium crispum. A very good variety.—G. E. W. Doronicum caucasicum.—M. K. 1, Alströmmeria aurantiaca; 2, Spiraea Douglasii; 3, Lonicera Ledebouri; 4, Spiraea callosa Anthony Waterer; 5 and 6, S. arizifolia.—J. S. Muscari comosum.—H. A. P. The Melon Pear or Pepino, sometimes called also Melon Shrub, is one of the edible Solanums, S. muricatum.

PEACH LEAVES: T. C. R. There is no disease present, the roots have got into some unsuitable material and will require to be lifted in autumn and replanted.—W. R. C. The Shot-hole fungus (Cercospora Circumscissa) is present on both Peach and Vine leaves. Spray with a rose-red solution of permanganate of potash.

ROSE: V. C. S. The injury is caused by aphides or plant-lice. Spray the bushes with a soft-soap wash, dissolving 1 lb. of soap in 10 gallons of water. This wash is most effective when used on the first appearance of the pest.

SEEDLING BORDER PINKS: Castle House. The flowers you send are of large size, and the petals are pure white; but we should not consider them superior to white varieties already in commerce.

SOIL AND MANURE ANALYSIS: G. S. L. Before undertaking this work it is essential you should possess a good knowledge of chemistry, and have access to a complete chemical laboratory. You will find much information on the subject in A Treatise on Manures, by A. B. Griffiths, price 7s. 9d.; and The Soil, by A. D. Hall, price 3s. 10d. Both these works can be obtained from our publishing department.

VINE LEAVES: S. Poplewell & W. H. The warts on the leaves indicate that there is too much moisture in the air. Better ventilation early in the day will put matters right.—A. B. There is no fungus or other disease present in the leaves. The injury has been caused by the sun's rays shining directly on the foliage, at a time when the leaves were partly covered with moisture. Employ a little ventilation early in the morning that the foliage may become dry before the sun's rays have become powerful.

HORTICULTURE IN EGYPT.

HORTICULTURE has been practised in Egypt for some thousands of years, but no remains of these ancient gardens exist, and all the gardens of any note now existing in that country are the work of Europeans.

Mohammed Aly Pacha and his son Ibrahim, in the first half of the nineteenth century, brought gardeners from England and France to lay out the gardens on the Isle of Roda at Cairo, and these became famous both for their beauty and for the collection of trees. Later, Ismail Pacha, Khedive of Egypt, employed European gardeners and spent large sums of money in constructing extensive parks around his palaces at Giza and Gezireh. The public gardens of the Esbekieh, and most of the trees now growing in the streets and suburban roads of Cairo, were also planted under this ruler's direction. Rich Europeans and natives followed his example, so that many of the best Egyptian gardens of to-day date from the reign of Ismail Pacha. Since the time of the

occupation of the country by the British, the Government has been unable to attend to any matters other than those which are capable of providing revenue, and this may be also said of many private persons who before had taken an interest in horticulture, so that, speaking generally, gardens in Egypt have during the last twenty-six years been greatly neglected. During the recent boom in land speculation, numbers of estates were sold and parcelled out for building purposes. Of the beautiful gardens on the Isle of Roda little remains excepting a few trees, which, by chance, were not in the way of the road-makers and builders, whilst at Giza and Gezireh the only remnants are the Zoological and Palace Hotel gardens. One, however, still finds beautiful but solitary specimens of exotic trees which tell their own tale of the past. At the present time interest in horticulture is again growing, and almost all the European residents living outside the towns have their own gardens.

Native gardeners are employed chiefly, although a few of the wealthier proprietors have brought men from Europe. At Alexandria there is a thriving horticultural society, which is subsidised by the Government, and this association numbers amongst its members the best horticulturists and botanists in Egypt. Mr. David Fish, late of the Royal Botanic Gardens at Edinburgh, is the secretary. An experimental station has been established; seeds are being distributed, and exhibitions, which would do credit to any society in England, are held twice each year. The Khedivial Horticultural Society at Cairo is now being reorganised under the name of la Société d'Horticulture Commerciale.

Commercial horticulture in Egypt has undoubtedly a great future before it. A considerable and profitable trade is done in cut flowers, but it is mostly in the hands of small growers who give little or no attention to improving the quality of the produce which they offer for sale. Roses, which may be said to grow like weeds, are by far the commonest market flowers. Good blooms sold at Cairo last Christmas for a shilling each. Violets and Chrysanthemums are also largely grown for supplying cut flowers, but Chrysanthemum flowers seldom compare favourably with those one sees in the florists' shops of Europe and America.

Owing to the increasing number of people who spend the winter months in Egypt, the florists' business must in time become an important industry. The nursery trade is also capable of great development, and at present a demand exists for ornamental trees and shrubs, as well as for trees for the production of firewood, telegraph poles, &c. With few exceptions the nurserymen content themselves with the propagation of those kinds which are already common in the country, and even for these the demand is greater than the supply, but there are hundreds of beautiful and useful plants which only need introducing to become popular.

The subjects now grown are natives of varied climes; trees from the Northern States of America may be seen growing side by side with others from Brazil and India. Many species of Palms will grow in the open air in Egypt, and plans are in preparation for the propagation, on a large scale,

of these and other foliage plants for export to European markets. Plants grown in the open air are much harder than those grown in hothouses, and there appears little doubt of the success of the enterprise, especially as the cost will be small. Another branch of commercial horticulture in which great developments may be expected in the near future is the cultivation of fruit and vegetables for export. Hitherto cotton and other purely agricultural crops have occupied the attention of cultivators, to the exclusion of what have been regarded as garden crops.

As the production of cotton is increasing in other countries, people in Egypt are asking themselves whether they are wise in relying so fully on this crop. Many growers have probably been deterred from fruit growing by knowing that they must wait three, four, or six years before receiving any returns from the trees, but they ignore the fact that vegetable crops may be grown between the trees almost up to the time they begin to fruit.

The profits derived from the cultivation of vegetables and fruits have in several cases far exceeded those derived from agricultural crops.

BANANAS.

Growers of Bananas rarely realise less than £60 clear profit per year per feddan (a little over an acre), and from one plantation of 25 feddans in the province of Galoubieh, the owner has this year made a profit of over £2,000. Many Bananas are yearly imported into Egypt, so that for home consumption alone there is already a market, but a local market alone would not be sufficient to warrant the institution of a Banana industry. Egypt, however, is more favourably situated than any other country for a Banana trade in the Mediterranean, Adriatic, and Black Sea ports. As compared with the Canary Islands, the cost of transport from Egypt is in most cases less than half. The export trade of Alexandria and Port Said is served by numerous lines of fast and up-to-date boats, which daily leave those ports for all parts of the world. The Chinese Banana, which fetches the highest price in the European markets, thrives exceedingly well in Egypt, and bears crops equal in weight to any produced in the West Indies or Canary Isles. Clumps planted 10 feet apart annually produce 4 bunches of fruits containing from 8 to 10 hands each. Banana cultivation was considerably checked a few years ago by the appearance in the plantations around Alexandria of an eel-worm which attacks the roots of the plants. Fortunately this trouble has since almost disappeared, and it will probably give little further trouble if a systematic course of transplanting is followed.

ORANGES AND LEMONS.

The cultivation of Oranges and Lemons is also capable of great development in Egypt, although for various reasons it will probably be slower than in the case of Bananas. All the best varieties of Oranges are grown to some extent, including the Jaffa, Blood Orange, Mandarin, and Washington Navel, or seedless Orange. Lemons and ordinary sweet Oranges of excellent quality are grown everywhere. Experimental shipments sent to England have been most favourably reported upon and have brought excellent

prices. As in the case of almost all other kinds of fruits, the Orange supply is not sufficient to meet the local demand, and large quantities are imported yearly from Italy, Syria, and elsewhere. Properly managed Orange plantations in Egypt yield a margin of £20 per year per feddan, after rent, water-tax, and all working expenses are paid. As a rule, however, the methods of cultivation followed admit of great improvement. The majority of the trees have been raised from seeds, but the Citron, (*Citrus medica*), where grafting has been practised, has been largely used as a stock instead of the Sour Orange. In the month of March cuttings of the Citron are made about 9 inches long, and two buds of the variety to be propagated are inserted in the upper half of each cutting, which is then inserted in ordinary soil, care being taken that the buds face to the north and south. About 50 per cent. of the cuttings thus planted form roots so that it is a quick and easy method of propagation. But such trees are short-lived; they have a bad straggling habit, and produce fewer fruits of poorer quality than those grown on stocks of the Sour Orange. During the last ten years the Citrus scale (*Lepidium asperidium*), has spread largely in the Orange plantations and has done much harm to the trees. Although in other countries it has been found a fairly easy matter to keep this pest under by spraying,

Hort. bog., 39; Fl. bot. Zeit., 1842, Beibl. II. 1; Miq. Fl. Ind. Bat. III., 646; and gives as synonymous *B. Reinwardtii* Rchb. f. in Walp. Ann. VI., 246; *B. galbinum*, Ridley in Journ. Linn. Soc. xxxii., 267. *Ephippium uniflorum*, Blume Bijdr. 309 (the earliest reference); *Cirrhopteratum compressum*, Lindl.; *Sarcopodium Reinwardtii* Lindl. Fol. Or.; *Phyllorchis uniflorus*, O.K., and *Phyllorchis Reinwardtii*, O.K. Dissimilarity between even the few specimens available was remarked by Lindley, for in *Folia Orchidacea*, under *Sarcopodium Reinwardtii*, he remarks: "There are two varieties known to me, one with leaves 8½ inches by 3½ inches—*Reinwardt*; the other with leaves 6½ inches by 1½ of an inch, and thinner—*T. Lobb*. Flowers greenish, 1½ inch from tip to tip of sepals. Column, column-foot, and lip crimson." Those remarks apply to the plant and not the flowers. But with the flowering of the *Bulbophyllum galbinum* here illustrated, there is evidence that there are specific differences in at least two of the plants enumerated as one species.

For the present the question of the identity of *Bulbophyllum Reinwardtii* with the *Bulbophyllum uniflorum* of Hassk., and with the other synonyms cited may remain, for the earliest references are so brief that they help but little.

The real question which concerns us is the

The case of the *Bulbophyllum uniflorum* is still farther complicated by the name being used for another species by Griff. Notul. III.; *Sestochilus uniflorus*, Orch. Java. t. 3; and *Sarcopodium uniflorum* figured in *Revue Horticole*, 1866, p. 152, and which is also at Tring Park with others of the *Bulbophyllum Lobbii* section. Drawings are being prepared of each as it flowers, and already the differences shown are too great to reconcile with the opinion they are all of one species. J. O'B.

ODONTOGLOSSUM ASTARTE.

(*O. HARRYANUM* ♀ × *O. TRIPUDIANS* ♂.)

THIS may be considered one of the least showy of the great *O. Harryanum* family, but it is not always easy to see what future plants of the same cross may be; its lip, at least, is a fine feature.

A small plant, blooming with only two flowers for the first time, does not fully indicate its final development. I raised it more for experiment to see what parallel influence would be seen upon *O. crispum* and *O. Harryanum* by crossing with *O. tripudians* as the pollen parent. It has appeared in the lip in a decided manner, as it does in the lips of all forms of *O. × bellatulum*.

The sepals are brown, this colour being only broken by two bars of yellow that do not extend to the edges, and by the tips, which are also yellow.

The petals are similarly coloured with the addition of some violet-purple, shaded into the basal marks. The lip has a white ground, but the lower two-thirds portion is heavily spotted with deep lilac, the yellow around the crest being almost suppressed by it; the apex is white, with a somewhat widened blade, as in *O. tripudians*. The central keels are elongated much more than is usual in *O. Harryanum* hybrids, from the influence of the similar character in the male parent.

The column is cream-white, with very small lacerate wings, slightly marked with brown.

In form it is somewhat poor, the segments being rather narrow and the petals standing forward at an angle of 35° to the plane of the flower. De B. Crawshaw.

ODONTOGLOSSUM ASTRÆA.

(*O. × FASCINATOR* (NAT. HYB.) ♀ × *WATTIANUM* CRAWSHAYANUM ♂.)

THIS hybrid also has inferior form, but its colour scheme is most pleasing.

The greater influence in respect of colour comes from the female parent; but in form the flower is more like *O. Lindleyanum*, the female parent once removed. I expected this, therefore am not disappointed, for it proves what I have often stated, viz., that reversion to ancestors will be in relation to the individual strength of those ancestors to impart their characters upon their descendants.

To explain these details without the aid of photographs or paintings, I must state that the ground colour of the *O. × Fascinator* I used was creamy-yellow, with some rose in it; it was very lightly spotted in both the sepals and petals two-thirds distance from their bases, and also had a group of "punctatum" spots in their lower areas. In form it was ordinary.

The ground colour of the *O. Wattianum* was yellow, copiously spotted with brown, its lip being also yellow, with a heavy brown blotch under the crest.

This new hybrid, of which I have as yet only bloomed one plant, may show as great an improvement in the future as in the case of the male parent. The sepals are greenish-yellow, with a little rose suffusion, containing one brown blotch at two-thirds distance from the base, also a broken line of spots around the margins, and an incipient inferior bar made up of a few spots.

The petals are of a pleasing shade of rosy-yellow, with a smaller blotch placed as in the

FIG. 14.—*BULBOPHYLLUM GALBINUM*: FLOWERS YELLOW WITH REDDISH LINES AND CRIMSON SPOTS.

nothing has yet been done in Egypt to prevent its ravages. The Government, through the agency of the various horticultural societies, is now devoting attention to this matter, so that something may be done in the near future to minimise this evil. T. W. B.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

BULBOPHYLLUM GALBINUM, RIDLEY.

THE illustration at fig. 14 has been prepared from a specimen which flowered recently in the garden of the Right Hon. Lord Rothschild, Tring Park, Tring (gr. Mr. A. Dye), the plant having been obtained by the Hon. Walter Rothschild as *Bulbophyllum Reinwardtii* Rchb. f. The flowering of this interesting plant seems to solve one important question relating to this group of *Bulbophyllums*, and opens up other interesting matters, which for want of original material, cannot so easily be solved. J. J. Smith, in his clever and useful work *Die Orchideen von Java*, refers both *B. galbinum* and *B. Reinwardtii* to *Bulbophyllum uniflorum*, Hassk., Cat.

relation of *B. galbinum* to *B. Reinwardtii*, and reference to the material in the Kew Herbarium, in which there are both Lindley's original specimen and the drawing of *B. Reinwardtii*, and authentic material of Ridley's *B. galbinum*, indicates tolerably clearly that those two at least are distinct species, and such is the opinion of Mr. R. A. Rolfe, who has carefully examined the material. Lindley's specimen of *B. Reinwardtii* has a much narrower labellum than the *B. galbinum* here illustrated, and a greener ground colour to the sepals and petals.

The *B. Reinwardtii* for which Sir Trevor Lawrence, Bart., obtained an Award of Merit at the Royal Horticultural Society on May 9, 1905, and of which there is a drawing in the Society's collection, is probably the true plant, the length in proportion to the breadth of the labellum compared with *B. galbinum* being very marked. The growth of the plant is similar to *B. Ericssonii*, the narrow, compressed, dark-green pseudobulbs bearing ovate oblong leaves on short, stout stalks. The flowers are light honey-yellow, with slight reddish lines on the sepals and petals, and crimson spots on the bases of the lateral sepals, lip and column. One flower represents the lip down, the other has it tilted upwards.

The plant is Malayan, but the exact locality in which it was collected is not known.

TREES AND SHRUBS.

CÆSALPINIA JAPONICA.

THE warm summer experienced last year evidently suited the requirements of this shrub, for it has flowered very freely this season. Introduced from Japan by Messrs. Jas. Veitch &

sufficiently hardy to endure the winters of this country. Left to itself, it forms a loose, spreading shrub, needing a trellis or wall for its support. The stems and branches, armed with stout, recurved prickles, are clothed with bright, green, feathery foliage, composed of bi-pinnate leaves, and the foliage provides a pleasing setting to the yellow flowers. These are produced in erect racemes, about a foot in length, each

FIG. 15.—CÆSALPINIA JAPONICA: FLOWERS YELLOW, HALF NATURAL SIZE; DETACHED FLOWER REAL SIZE.

The column is almost like that of *O. Lindleyanum*.

The seed pod was produced by using *O. Wattianum* Crawshayanum when it bloomed for the second time in 1901, and had not then acquired the great development which it showed when it bloomed in 1903 and was awarded A.M. R.H.S. on May 19. *De B. Crawshay*.

Sons, it flowered with them for the first time in 1887, but it does not seem to be a very well-known plant, although several nurserymen have exhibited cut sprays in their groups this season. The genus *Cæsalpinia*, which commemorates the name of the Italian botanist Andreas Cæsalpinus, is essentially tropical, and of about 50 species known, *C. japonica* is the only one

bearing from 20 to 30 blooms. Each flower is about an inch in diameter; the petals are a rich, canary shade of yellow, which contrasts well with the crimson of the filaments and anthers.

A plant in the Coombe Wood Nursery is growing in gravelly clay soil, and the shoots are supported on a trellis. At Kew the plant is afforded the protection of a wall. *H. Spencer*.

LIBOCEDRUS MACROLEPIS.

A young specimen of this Conifer planted at Pencarrow last autumn and partially protected, has survived the severe cold of the past winter, and is now growing freely. The young growths have a healthy, bronzy tint, but generally the tree looks soft and sappy, and one would hesitate before pronouncing it perfectly hardy. It is a coniferous tree of a distinct character, and it should be established in this country if possible. The past winter was an exceptionally severe one—as much as 18° of frost was registered on one occasion here—and such trying conditions may not again be experienced for some years to come, and the trees may then be established and better able to withstand cold.

ESCALLONIA RUBRA.

ESCALLONIA macrantha is extremely common in seaside gardens in the West of England, where, no matter whether it is planted in good loam or left to battle for itself on the top of a stone hedge, it flourishes well. The smaller and less showy species, *E. rubra*, is very rare. It is just as accommodating as its congener in the matter of soil, and is even more free in flowering, the season of which extends from July until late in autumn. As the specific name indicates, the flowers are red in colour, and seen from a short distance the plant much resembles a broad bush of *Fuchsia gracilis*. It has an additional recommendation in that it thrives well under the shade and drip of deciduous trees. I have never seen the flowers

colour and sickly in appearance, and the severe weather of last winter practically killed it, for it was cut down to the ground and only one tiny branch retains any life. In its habit and superficial appearance it has practically nothing in common with the rest of the members of the genus. A well-grown specimen would have value and interest in a large conservatory. A solitary example of *Agathis australis* (*Dammara australis*) struggled hard for existence at Menabilly, but the result was far from encouraging. *A. C. Bartlett, Pencarrow Gardens, Cornwall.*

OLEARIA MACRODONTA.

THIS plant is generally considered somewhat tender, and a sheltered position is usually recommended for its planting, but at Bagshot a speci-

FIG. 16.—GROUP OF ORNAMENTAL FOLIAGE PLANTS EXHIBITED AT THE HOLLAND HOUSE SHOW BY MESSRS. W. BULL AND SONS.
(See the report published in the issue for last week p. 34.)

I selected, as a probably suitable place for the planting, a sunny slope at a good altitude, and one that is sheltered by trees, from the prevailing winds. The soil was a loam of medium quality, and my object was to ensure that the tree should be fairly dry at the roots during the winter. I anticipated that in a moderate loam the new growths would be firm and not so susceptible to injury during the winter. An extremely healthy and well furnished specimen growing in a large pot in the temperate house, Kew, proves that this species is a suitable subject for the decoration of the cool conservatory.

of the normally white species *E. floribunda* (known in Cornwall as *E. montevidensis*) so universally rose-tinted as they are this year. The flowers attract numbers of flies, which fall victims to the clammy resinous exudation.

PODOCARPUS NAGEIA.

THIS species, the most interesting member of the genus, is, unfortunately, far too tender for planting out-of-doors except in some unusually favoured district. A small specimen in these gardens survived during two winters, and during the following summers made a fair amount of new growths, but it was pale of

men has been growing uninjured in a fully-exposed position for the past two years, and that notwithstanding 20° of frost has been registered on more than one occasion in this neighbourhood. This species forms a handsome evergreen shrub 6 feet or more in height, and affords a welcome change among hardy evergreens. Its alternately disposed leaves measure from 3 to 4 inches in length and 1½ inches in width, and they bear a strong resemblance to those of the common Holly. The margins are irregularly cleft, and appear at first sight to be armed with stout spines, but on touching them they are found to be very little harder than the remainder

of the leaf. The upper surfaces of the foliage are of a pale, shining green colour, and the undersides are covered with a silvery tomentum, which is also present to a lesser extent on the points of the young growths. These latter are of a brownish-red hue, and roughly five-angled. The white flowers appear in July, and they are borne in axillary, branching clusters, individually resembling a tiny white flower of *Cineraria stellata*. The plant is a vigorous grower, and should be given a position that is fully exposed to the sun, in order that the wood may become thoroughly ripened. This *Olearia* is easily increased from cuttings of half-ripened wood inserted in summer time in a plant-house, or from fully-ripened growths cut into 6-inch lengths, inserted out-of-doors in a sheltered spot in autumn.

ZENOBIA SPECIOSA.

Probably no plant is more neglected than this, and yet, when in bloom, it is one of the handsomest of the smaller members of the Ericaceæ. It grows about 4 feet in height, and produces graceful, drooping or upright branches that are clothed in June and August from end to end with axillary clusters of comparatively large, pure-white, bell-shaped flowers. The ovate leaves are about 2 inches in length, coarsely toothed, dull-green above, and shining beneath, a rather rare condition in hardy shrubs. The variety *pulverulenta* resembles the type, except that the under surfaces of the leaves are silvery and glaucous, which also obtains, to a certain extent, on the stems and the upper surfaces of the leaves. *Zenobias* are propagated by means of layers or seeds.

LEDUM PALUSTRE.

This has proved by far the best of the *Ledums* here, being more free-flowering and easier to cultivate than the other members of the genus. It makes a shrub 3 feet in height and as much in diameter, and is covered in May with terminal clusters of small, pure-white flowers. The ovate-lanceolate leaves are 1½ inches in length, narrow, and turned downwards at the edges. They are glabrous on the upper surface, and are covered beneath with a brown, woolly tomentum, as is also the young wood. The plant has a pleasing aromatic scent when rubbed by the hand. It is a native of the Northern Temperate Zone, and its habitat extends into the Arctic Circle. The species is easily increased by layering.

CLETHRA ALNIFOLIA.

This is a native of North America, and is an upright, deciduous shrub 5 or 6 feet in height; it will grow freely in almost any soil or situation. The leaves are from 4 inches to 5 inches in length, shining above, and serrated on the edges. The pure-white flowers are produced in July and August in upright, terminal spikes, and are very sweet-scented. The variety *tomentosa* is an improvement on the type, the leaves being distinctly woolly, and the flower-spikes larger and purer in colour. Both are readily propagated from layers or suckers. *J. Clark, Bagshot, Surrey.*

NOTICES OF BOOKS.

ROCK AND ALPINE GARDENING.*

THIS handy little volume consists of 80 pages of letterpress, with illustrations. The chapters include the following subjects: "Introduction," "Choosing the Site," "Selecting the Material for the Rockwork," "Hints on Building," "The Planting of Rockeries and Rock Gardens," "The Question of Labels," "Insect and other Pests," "Wall Gardening," &c. Upon each of these in turn some practical advice is offered, but in not a few instances much more might have been added with advantage. The chapter on "Wall Gardening," p. 26, is, we think, all too brief and incomplete for this highly interesting phase of

modern gardening, and it is not quite in accordance with general experience to say that "the large majority of plants suitable for growing in walls prefer a sunny position, and this being the case, preference would be given to one facing south." As a matter of fact, the shaded or half-shaded wall may be furnished just as readily as one with a south aspect, and the same subjects may, to a large extent, be employed in both, the chief observable difference being excess of vigour and freedom of growth where the partial shade exists. Much of the success in wall gardening depends upon the manner of structure, and the components of the wall itself.

The illustrations include views of natural Alpine scenery, and artificially constructed rock gardens in various parts of the country. Among those of the latter description, amateurs and others interested in this style of gardening will find much that is suggestive and useful, one of the best illustrations being the rock and water scene on page 29. "The Shady Nook," page 49, is also pleasing. Pages 36 to 59 are devoted to brief descriptions of some of the better-known Alpine and rock plants. The extreme brevity of the text, the collective references, in not a few instances, to species of widely-varying character and requirements are likely to cause some difficulty to amateurs. The concluding pages of the book contain lists of plants suited to special soils and positions. The work is written by a cultivator, and the information on cultural matters may be therefore depended upon, but in the preparation of a second edition, the descriptive matter might be much improved.

THE ALPINE GARDEN.

IRIS SIBIRICA "SNOW QUEEN."

THIS *Iris* does not seem much like any form of *I. sibirica* that I have seen, and I think that Mr. Mallett may have some reason for suggesting, on page 28, its possible hybrid origin. There is, as Mr. Mallett says, in the foliage a breadth and robustness which more resembles that of *I. lævigata* than that of *I. sibirica*, and the whole character of the flower brings it closer to *I. lævigata* than to any other species known to me, and much cultivated in Japan. This *Iris* is by far the finest of the white *Iris*s of the *I. sibirica* type, but it has a slight suffusion of yellow on the claw. My own plant is only a small one, but it is sufficiently large to give one a good idea of its future beauty. *S. Arnott, Sunnymead, Dumfries.*

CAMPANULA MICHAUXIOIDES.

AMONG my acquisitions of last year was a plant of the scarce *Campanula michauxioides*, a somewhat awkward name, as it might be confused with the allied *Michauxia campanuloides*. So far as its resemblance with the latter is concerned, it cannot be said that the name is inappropriate, as there is about its general appearance a considerable likeness to that plant, given generally by the looseness of the inflorescence and the form and pose of the star-like flowers. These are drooping, on slight, but rigid pedicels, and are scattered sparsely over the numerous branchlets which fork from the branches, produced from the main stem, which rises to a height of about 4 feet. The flowers are a pale shade of blue, about the size of a shilling, and are decidedly attractive. The whole aspect of the plant is distinct and attractive, although far from being showy. The leaves may be roughly said to resemble in form those of *C. Trachelium*, but are more deeply serrated. This *Campanula* was first described by Boissier, but I have not access to the work at present. I think, however, that my specimen is correctly named. One is afraid that the plant will prove to be a biennial. It came into flower here about the second week of June, and it will probably last until the end of July, the dull weather having been favourable to the prolongation of the period of bloom. *S. Arnott, Sunnymead, Dumfries.*

THE STRAWBERRY CROP.

THIS year the earliest fruits from the open were marketed during the second week in June, or nearly a week earlier than in 1906, when the first baskets of fruits were not marketed until after the middle of that month. Every year, too, the season seems to last a little longer than usual, and it appears quite reasonable to anticipate the Strawberry being in season from the beginning of June to the end of July.

The increase of early supplies of Strawberries from the Continent has seriously affected the prices of these fruits grown under glass in this country. Not many seasons ago it was possible to realise from 8s. to 10s. a pound for fairly good fruits in April, and 3s. a pound for the last of the indoor crop during the early days of June. Such prices as these can nowadays only be looked for upon those rare occasions when some sudden demand or a period of bad weather causes an unusual amount of business. It seems likely that Strawberry production under glass will not show any great increase in years to come, except, perhaps, in the case of those fruits produced in cold frames or unheated houses, which fruits, it may be stated, are the most satisfactory of all the forced crop. The superiority, indeed, of the fruit grown in unheated houses over that which is forced by fire-heat is as great as the difference in excellence between the outdoor crop and that which is grown under glass under any conditions.

The enormous increase in the demand for Strawberries—still the most popular of all summer fruits—is best illustrated by the figures with which the writer has been kindly supplied by the various railway companies whose business it is to deal with these huge consignments. Taking the foreign crop first, and this comes chiefly from France; in 1906 no fewer than 1,416 tons of fruit were brought by the Great Western Railway Company to London in the spring and early summer of that year. These quantities are so remarkable that one felt obliged to enquire whether they applied to Strawberries alone, or whether they included other products. But it was found that these figures related almost entirely to Strawberries, and that although a few consignments of early culinary Peas were included in the total, these vegetables form only a very small proportion. So large, indeed, has the Continental traffic in Strawberries latterly become, that the growers now find it worth their while to charter special steamers for the conveyance of their fruits from Brest to Plymouth.

Coming nearer home, the Strawberry traffic from the West of England supplies some equally large figures. The industry is pursued chiefly in the districts of Saltash and Tavistock, and from these two places the Great Western Railway Co. carried last season no fewer than 428 tons of produce, of which the bulk was Strawberries. These figures, although they concern two districts only, are particularly striking, because they do not refer to the main crop, in the market interpretation of the term, but only to the early crop, which pays to send all the way to London.

Before leaving the subject of Strawberry production in the West of England it may be permissible to add a few words regarding the packing and proper marketing of the berries—questions to which the English grower has never given such careful attention as the subjects warrant. But this year there is a marked improvement in the appearance of the fruits on their arrival in the market, and certainly none has arrived in better condition than the Cornish berries that are put up in half-pound chip punnets, the latter being firmly packed in layers one above the other in light cases containing from two to four dozen baskets. There is still, however, much room for improvement in these matters, and the sooner that the British grower learns that it is a mistake to pack as much as 12 lbs. of immediately perishable fruit in a

* "Rock and Alpine Gardening," by H. Hemsley, published by J. Cheal & Sons. Price 8s. 6d.

single basket, the better will it be for his pocket. The Kent "peck" basket, containing 12 lbs. of fruit, is quite unsuited for the transit of Strawberries, and there can be no doubt that the Hampshire gallon handle-basket is quite the largest that it is advisable to use. Those who wish to learn how Strawberries should be packed in bulk should inspect the French fruits sent over here in crates, in which flat baskets containing about 2 lbs. of fruit apiece are packed in a single layer. The fruits arrive in London after their long journey in the very finest condition, and have the appearance of having recently been picked.

Even more astonishing than the figures of the

half this enormous total, and the rest goes to Liverpool, Manchester, Birmingham, Newcastle, Glasgow and Edinburgh in through carriages to its destination.

As is only to be expected under the circumstances, the railway company has made a special study of the business, and has built vans on the most approved principles for the carriage of these fruits. The baskets stand on shelves side by side, and, having handles, they cannot be stood one upon the other and thus damage the fruits. At times of great pressure old passenger carriages, fitted with movable shelves, are utilised. Between 60 and 70 thousand baskets do not constitute an unusual daily consignment,

thing for a child to fill 30 or 40 baskets in the day.

Kent contributes largely to the Strawberry supply of Great Britain, but actual statistics are not available.

This year's Strawberry crop has been a good one, but the berries have suffered greatly from want of sunshine, and frequent showers have interfered with picking operations. Prices have been about average; the earliest and the best of the fruits fetched 1s. a pound wholesale, but they dropped in value day by day until their value became fairly stationary at from 3d. to 4d. per pound. The smaller fruits, towards the end of the season, are not worth more than about 2d. or 2½d. per pound, and when these prices

[Photograph by J. Gregory.]

FIG. 17.—HYBRID TEA ROSE JOSEPH LOWE, WHICH OBTAINED THE R.H.S. AWARD OF MERIT AT THE HOLLAND HOUSE SHOW WHEN EXHIBITED BY MESSRS. LOWE AND SHAWYER: COLOUR A SHADE OF PINK. (See report on p. 36 in last week's issue.)

Strawberry traffic from the Continent and the West of England are those which have been supplied by the London and South Western Railway Co. concerning the average amount of these fruits handled annually by them in the Southampton district. Every season from the neighbourhood of Swanwick, Wickham, Fareham, Sarisbury, Bursledon, Sholing, Netley, &c., it is necessary to run six or eight special trains each day to convey the fruits to London and large towns in the Midlands and North of England. An average season's picking amounts to some 3,500 tons, represented by about 1,500,000 gallon baskets. London takes about

this total representing between 300 and 350 van-loads of Strawberries.

At the present time there are about 150 Strawberry growers in the Southampton district, and the varieties chiefly grown are Royal Sovereign, Sir Joseph Paxton and Laxton's Noble. The persons who gather the fruits earn much money during the three weeks or more that the crop lasts, and many of them can make from 10s. to 15s. a day when the crop is a good one, and they are paid at the rate of 1½d. per basket. They work from early morning till about 2 p.m., and then, after an hour or two's rest, they resume picking until dusk. It is no unusual

rule, the growers place the fruits into tubs and sell them for jam making.

Marvellous as the development of the Strawberry-growing industry has been of late years, it must not be supposed that fortunes are being made. It is essentially a speculative undertaking from start to finish, and the crop is an expensive one to cultivate and to market. With all its difficulties, however, those who carry it out thoroughly make a good living out of it, and will continue to do so as long as they cultivate improved sorts and attend to the all-important matters of careful grading and packing. *East Sussex.*

THE USES OF LIME.*

(Concluded from page 24.)

THE INFLUENCE OF MANURES ON LIME IN THE SOIL.

The various classes of manures used in farming have some bearing upon the rate at which lime is washed out, and this question has been investigated at Rothamsted. The results of the investigations may be given briefly as follow:—

- (1) Superphosphate, sulphate of potash, kainit, and kindred manures do not increase the loss to any appreciable extent.
- (2) Farmyard manure and probably all organic manures diminish the loss of carbonate of lime.
- (3) Nitrate of soda also diminishes the loss.
- (4) Sulphate of ammonia increases the loss, removing about half its own weight of lime or nearly its own weight of chalk.

Lime sinks in the soil of grass land from purely mechanical reasons; in arable land this sinking is less marked, but the lime is subject to a greater wastage by solution in the rain-water percolating through the soil.

THE CLASSES OF LIME.

In nature lime generally occurs as carbonate of lime, in the form of chalk, limestone, marble, marl, and other substances. Perhaps one-sixth part of the rocks composing the earth's crust consists of this material.

Those materials containing lime which are of any agricultural importance may be tabulated as follow:—

1. *Bases*, capable of neutralising acids.

Quicklime, burnt lime, lime-shells, caustic lime = lime.

Slaked lime = lime and water.

Chalk, limestone, marl, old mortar, &c. = lime and carbonic acid.

Basic slag = lime and phosphoric acid (lime in excess).

2. *Neutral salts*, in which the lime is already neutralised by a strong acid. Compounds of this class occur in:—

Gypsum = lime and sulphuric acid.

Bones and mineral phosphates = lime and phosphoric acid.

3. *Acid salts*, which contain more acid than the lime can neutralise. Compounds of this class occur in:—

Superphosphate, dissolved bones = lime and phosphoric acid (phosphoric acid in excess).

Quicklime and slaked lime.—The most common form in which lime is purchased by farmers is that known as burnt lime, lime-shells, quicklime, or caustic lime. It is obtained by burning either chalk or limestone in a lime-kiln. Quicklime greedily absorbs and combines with water, forming slaked lime, while it also readily takes up carbonic acid gas from the atmosphere, forming carbonate of lime which is similar in composition to pure chalk or limestone. For this reason quicklime should be exposed as little as possible to rain and to the atmosphere, but should be applied to the land without delay.

Where coal is cheap the price of good lime at the lime-kiln averages perhaps 9s. per ton. A guarantee should be obtained that it contains not less than 85 per cent. of quicklime and not more than 4 per cent. of magnesia.

Ground lime.—This consists of burnt lime (quicklime) which has been ground to a fine powder. It should be similar in quality to quicklime, but is often impure and contains less lime than ordinary quicklime.

Ground lime is more expensive than lime-shells, owing to the cost of grinding, which may amount to 6s. per ton, while an additional 3s. must be added for sacks. A good sample therefore may cost about 18s. a ton at the lime-kiln.

Chalk.—This substance is really a soft limestone, and, when the flints are removed, is

usually a very pure form of carbonate of lime. When fairly pure it will contain about half its weight of lime.

Marls.—These are mixtures of earthy matter and carbonate of lime, but their consideration is beyond the scope of this leaflet.

Gypsum.—This compound of sulphuric acid and lime is seldom employed as a separate manure, but it forms about two-fifths of the weight of ordinary superphosphate.

Gas lime.—This form of lime is a by-product in the manufacture of coal gas, for which lime is employed as a purifying agent. It consists of slaked lime more or less saturated with compounds of sulphur; it is liable to considerable variation in composition, and often it has but little basic property left in it and so cannot take the place of lime or chalk. It contains small proportions of certain compounds of sulphur which are virulent plant poisons, this fact necessitating great care in its use. It is unprofitable to use it at considerable distances from a town, or where high railway rates prevail, as the percentage of lime present is usually small.

half a ton of sand for each ton of lime. The lime in such a heap will keep for a considerable time. Before using, the heap may be screened through a three-eighth-inch gauge locking screen. Lime thus slaked should be in a fine powdery condition, and the sand mixed with it renders the spreading a somewhat less dusty process. Lime when overslaked becomes pasty, after which even distribution in the soil is impossible. The lime may be carted to the land and distributed by hand direct from the carts, a process which must be thoroughly done. It is much better, however, when small quantities are being applied to adopt the American plan, i.e., to use a suitable manure distributor, to which old bagging should be attached at the sides and behind. This trails along the ground, insures better distribution, and prevents much of the discomfort that is otherwise caused by the blowing about of the fine lime. Glasses for the eyes and protective devices for the nostrils and mouth are also used by men who do this work.

Since lime is used for many purposes, the proper quantity to apply varies widely. Common dressings are from two to three tons of lime-

Photograph by J. Gregory.

FIG. 18.—PORTION OF MR. AMOS PERRY'S WATER GARDEN AS EXHIBED AT THE HOLLAND HOUSE SHOW. (See report in the issue for last week, p. 35.)

Basic slag.—Basic slag is a by-product in the manufacture of steel, and is very largely employed as a phosphatic manure. It usually contains about 45 per cent. of lime, and from one-third to one-half of this is probably in the caustic form. Half a ton of basic slag may therefore supply as much lime as is contained in from 2 to 4 cwt. of ground lime.

THE APPLICATION OF LIME.

The most common method of liming is to put quicklime on the land in small heaps and allow it to slake naturally, or to slake it with water from a water-cart. It may then be spread from a shovel and harrowed in at once. Lime-shells may also be slaked as is done by a mason's labourer, reducing them to a fine powder. They are spread in layers a foot deep, one above the other, each layer receiving about 6 cwt. of water per ton of lime, or rather less water if the lime is inferior. The heap is then covered with about

shells at intervals of from six to ten years. Smaller dressings of about one ton per acre once in four or five years are now becoming common. Considerably larger quantities than the above may be used in the treatment of newly-reclaimed land rich in organic matter and plant food.

Ground lime.—This is usually applied by means of a manure distributor at the rate of from 5 to 30 cwt. per acre.

Gas lime.—Owing to the presence of certain poisonous compounds already mentioned, gas lime should be carefully spread on the land six or eight weeks before ploughing. It is best applied to lea in the autumn or early winter, at the rate of from two to four tons per acre. On most soils the oat crop which follows will be considerably benefited.

Chalk.—This material is not so easily distributed as lime, and as one ton of quicklime will contain as much lime as 1½ tons of chalk, it is necessary to apply the latter in much larger quantities than the former.

* Leaflet No. 170, issued by the Board of Agriculture and Fisheries.

KEW NOTES.

RODGERSIA TABULARIS.

QUITE unlike any of the other Rodgersias, except in the form of the inflorescence, this species is a distinct and interesting plant. It is a native of Northern China and Korea, and is said to grow in dense masses among coarse vegetation close to water. It is now flowering for the first time in the rock garden at Kew, plants having been raised from seeds obtained from the Imperial Botanic Garden of St. Petersburg in 1905. The peltate leaves, which resemble those of *Saxifraga peltata* in shape, are light green in colour, and from 9 to 12 inches in diameter. They are irregularly 7-lobed and borne on petioles 18 inches to 2 feet long, covered with stiff, white hairs which have a red-brown base. These disappear, to a great extent, as the plant gets older in the season. The stems grow about 3 feet high, and bear an arching panicle of white flowers. Dried herbarium specimens show a very luxuriant growth both in size of leaves and inflorescences, so that it is evidently an acquisition for the waterside and bog garden. More in general appearance like a *Saxifraga*, it has been formerly given a place in that genus under the name of *S. tabularis*. Another species also in flower at the present time is *R. pinnata*, with its crimson stems and petioles, and panicles of bright pink flowers. This is certainly the most handsome of all the Rodgersias when well grown. It flowered for the first time in this country at Kew in July, 1902, seeds having been sent from Eastern Yunnan by Dr. Henry in 1898. Both kinds enjoy a deep, rich and moist soil, with partial shade.

CALCEOLARIA HYSSOPIFOLIA.

THE various species of South American Calceolarias are so distinct and graceful in habit, and so rich and varied in the colour of their flowers, that it is strange that they are not more often seen in cultivation. Although the present species was introduced in 1865 from Quito, where it grows on the Andes at an elevation of 10 to 11,000 feet, it is somewhat rare in gardens. Its value as a bedding plant may be judged by a small, round bed of plants at Kew just producing their cymes of rich canary-yellow flowers. Growing about a foot or more high, this species is of free-branching habit, every shoot being floriferous. The Hyssop-leaved Calceolaria is much more easy to keep through the winter than the white one, *C. alba*, as it stands well in a cold frame. Cuttings also strike freely, so that it is easy to work up a good stock. Close by is another bed of the free-flowering *C. polyrhiza*, which is a useful plant for carpeting the ground beneath plants that do not make much foliage, like *Delphinium sulphureum*.

LATHYRUS FILIFORMIS.

OF all the low-growing members of this genus *L. filiformis* is one of the most charming and free-flowering. It is of bushy habit, growing about 1 foot high, and has pinnate leaves of two pairs of narrow leaflets, and racemes of 8 or more large violet-purple flowers. It is found over a great part of Southern Europe, and is somewhat variable in habit. A form of this species shown by Mr. Prichard, of Christchurch, obtained an Award of Merit at a recent meeting of the R.H.S. under the name of *Ervum gracile*. It produces its flowers freely in the month of June, and is an excellent plant for the rock garden as well as for the border.

PENTSTEMON HETEROPHYLLUS.

APART from the beautiful strains of florists' Pentstemons, there are many charming species quite as well worth growing. One of the prettiest of all the dwarf kinds is *P. heterophyllus*, which is a native of North-western America. It is almost a sub-shrub in its general aspect, making neat little bushes 1 foot to 15 inches high, with narrow, entire leaves, and racemes of clear blue, or rose-flushed flowers. It may be planted out in warm, sheltered parts of the rock garden, where it will stand through moderate winters. For bedding-out in the open, the plants should

be grown in pots in a cold frame during the winter, and planted out early in May. They come into flower early in July, and remain in bloom for a considerable time. Seeds are freely produced, and cuttings with a heel strike readily after the flowering period is over. Somewhat earlier in flower is the beautiful *P. secundiflorus* from the same country. It grows up to 2 feet high with single stems, the upper half composed of a one-sided, many-flowered inflorescence. The flowers vary in colour from azure-blue to purple. This species seeds freely, and is best treated as a biennial.

MISCELLANEOUS SPECIES.

AMONG other interesting plants in flower are two forms of *Lilium concolor*, namely, var. *sinicum*, scarlet with black spots, and var. *parthenon* (coridion), with golden-yellow flowers, from bulbs which were recently received from Wei-hai-wei. *Saxifraga Brunoniana* is a newly introduced species of the set which includes *S. flagellaris*, from the Himalaya. It has rosettes of narrow leaves like *S. aizoides*, and yellow flowers. The chief feature, however, is the numerous, crimson, thread-like stolons, which have a charming appearance. *W. I.*

The Week's Work.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Acalypha hispida (*Sandersoniana*).—Young plants raised from cuttings inserted last spring will now be growing strongly, and if the work has not already been done, they should be re-potted without delay into the pots in which they will flower. A good turfy loam will suit them well, but if it is of a close and heavy nature some manure from a spent Mushroom-bed and some leaf-soil may be added with it. Use pots of various sizes, according to the particular purposes for which the plants are required. Large specimens in 7-inch or 8-inch pots are very effective when in bloom. For the first few months the blooms should be pinched out as soon as they are seen, as the flowers show to greater advantage when the plants have lengthened somewhat. If grown on without a check they will soon reach a height of 4 or 5 feet, these, as a rule, attracting considerable attention, where an ordinary small and starved-looking plant would be passed without notice. It is a capital plant for house decoration, standing well for some weeks if not exposed to cold draughts. When the plants are in full growth, they should be liberally supplied with water, or the leaves will soon lose that luxuriant and fresh appearance which is a sure indication of good culture. Occasional weak applications of manure-water will be of great assistance. The plants should be grown in a light position in a warm house or stove, shading them lightly during the hottest parts of the day. When the long crimson spikes are fully developed, a drier and slightly cooler atmosphere will be suitable and will render the flowers less liable to damp off. The plants are very susceptible to attacks of red spider and thrip, but must be kept free from these pests. *A. macrophylla*, *A. musaica*, and *A. Godseffiana* are all worth growing, the latter being a particularly useful plant if grown in small pots for table decoration.

Achimenes.—The main batch will now be fast approaching the flowering stage. Attend to the details of staking and tying, using small inconspicuous sticks, such as the fast-dyed green Bamboo tips. As the flowers begin to develop, reduce the atmospheric moisture and gradually admit more air, to harden the plants slightly, for removal to a cool conservatory, or for use for indoor decoration in the dwelling-house. *Achimenes* will continue to grow and bloom for a long time provided that sufficient water is given them, copious supplies being necessary for strong-growing plants in full bloom. After the flowering stage is over, they should be returned to slightly warmer conditions, and water must be afforded the roots until the tops begin to wither, when it should gradually be withheld, keeping the roots dry and not too warm all the resting season. *Achimenes* are especially suitable for cultivation in hanging baskets, giving them the same cultural conditions as I have advised for plants in pots.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Budding Roses.—The time for performing this operation must depend on the condition of the stocks and on the season; but, generally, the next fortnight will be found a suitable period. Neither the prepared bud nor the incision on the stock must be exposed to the drying influence of the air for a moment longer than is absolutely necessary, and for this reason budding is most successful when performed in the cool of the evening. The bud should be tied in position directly after insertion, but the bud itself must be left free, and the binding must not be so tight as to check the flow of the sap. In the case of standard Briars the bud should be placed as near to the main stem as is possible; with dwarf Roses the bud should be placed low on the stock and near to the ground. After three to four weeks from the budding process the tying material should be loosened. It is usual to advise the cutting back of the Briar shoot at the same time as the ligament is cut, but as the bud needs to remain dormant until the following spring, it will therefore be wise to allow the Briar shoot to remain uncut.

Water Lilies.—As the older leaves begin to turn yellow they should be removed. The stronger-growing Nymphæas should have many of their green leaves removed in order to allow the flowers to be the better displayed. In such places as they can be easily reached, the faded flowers should be removed, for their removal will assist in prolonging the flowering period. This practice is especially necessary in the case of the fragrant *Aponogeton distachyon*, for this plant seeds so freely that unless the old scapes are removed the plant soon ceases to flower. With attention to this detail, the species may be kept in flower throughout the greater part of the year.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton, East Devon.

Early Peaches, including the varieties Amsden June, Alexander, Early Rivers, and Waterloo, are ripening in the warmer parts of the country, and will require gathering as soon as they can be parted readily from the tree. Much care must be taken not to bruise the fruits in gathering them. In order to expose the fruits to the sun, tie back any growths that are shading them, and remove a few leaves for the same purpose. Set traps of hollow pieces of Bamboo or stalks of Broad-bean for earwigs, which often spoil many fruits.

Morello Cherries are changing colour, and unless these fruits are well protected by nets, the birds will eat many of them. Although the Morello Cherry is usually planted in a cool position, such as at the foot of a north wall, they are benefited by an occasional watering, especially if it takes the form of diluted stable or cow stall drainings. As soon as sweet Cherries are harvested, examine the foliage, and, if black-fly is present, syringe the trees with extract of quassia. Apply the hose in any case, for dirt and rubbish accumulate at the back of the branches against the wall. Secure the leading shoots to the wall, and pinch any that are making a too luxuriant growth. This practice of stopping the shoots in summer is far preferable to using the knife in winter or early spring.

General remarks.—This month is always a busy one for the fruit-grower. The Strawberry beds must be examined every other day and the fruits gathered. If wet, lay them out singly in a dry, airy room. The leaves of a Lime tree that have been grown more or less in the shade, form an admirable material for packing these soft fruits in. Black Currants must be gathered within a few weeks of their ripening, or the berries will shrivel. Both Red and Black Currants should be placed in wide-mouthed bottles if intended for transit by rail, and this is also the best method of sending other soft fruits, such as the Raspberry, which, similar to the Strawberry, requires to be gathered in as dry a condition as possible. Ripe Gooseberries travel badly; only one layer of these fruits should be placed in a box. Cover the fruits with soft leaves and thin tissue paper, and complete the filling of the box with soft packing material, so that when the lid of the box is placed in position the fruits will not move.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq.,
Norwood, Alloa, Clackmannanshire.

The Vinery.—Ventilation should be very carefully applied to houses in which Muscat of Alexandria Grapes are ripening. During the present summer we have not, up to the time of writing these notes, opened the front ventilators of the Muscat house once. Unless the cold, unseasonable weather departs, keep the hot-water system in operation, but should the day promise bright, the valves should be closed in the morning. Damp the paths and the borders very lightly each morning and evening, as Muscat Grapes delight in a warm, humid, but in no wise a stagnant atmosphere, when the fruits are colouring. The presence of rust on the berries is caused by a dry, arid atmosphere, the result of too much artificial heat; but an excess of moisture will cause water to condense on the berries. This latter condition can be prevented by always allowing the top ventilator to remain open a trifle at night-time. Do not expose the bunches to the full rays of the sun, or some of the berries may become injured by scorching. A light shading material placed on the glass, or a piece of thin tissue paper pinned above the bunch, will obviate this injury.

Grape Lady Downe's.—The fruits, having commenced to colour, are now in no danger from scalding. The Vines will require a higher day temperature, and the atmosphere of the house should be kept in a more humid condition, with plenty of top ventilation both by day and by night. Examine the inside border with the soil tester, and, if it is found to be dry, give a copious watering, which should be the last for the season, unless the weather becomes warmer.

Peaches and Nectarines that are colouring should have an abundant circulation of fresh air about them both by day and by night, and syringing should be discontinued. The young growths should now be trained in position, superfluous growths removed, and also any leaves that obscure the fruit from the sun's rays. Secure the fruits by tying them according to the directions given in the Calendar for May 18th. Some persons hang a net under the trees to catch the fruits when they drop, but such fruits become more or less injured for dessert purposes, and tying is preferable. See that the inside borders are sufficiently supplied with water. Trees in the latest houses, and on which fruits are now swelling, should be occasionally supplied with manure water. Syringe the foliage on very fine afternoons, but never on dull or wet days. Discontinue syringing altogether as soon as the fruits commence to colour. If traces of red spider or mildew are seen, syringe the foliage with the mixture recommended in the Calendar for May 22. Thin the young growths, and save only those necessary for next year's fruiting.

Strawberries.—The first batch of runners which were pegged down into 3-inch pots last month should now be detached from the parent plants. Remove the pots into a cold frame, where they may remain until well rooted, after which they should be potted into their fruiting pots.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE,
Bart., Burford, Surrey.

Habenaria pusilla (militaris).—This brilliant, scarlet-flowering, terrestrial Orchid from Cochinchina is a species that deserves every attention, being extremely useful as a decorative plant, and its flowers are valuable for use in a cut state. *H. rhodocheila*, which produces bright vermilion flowers, *H. carnea*, of soft flesh colour, and *H. c. nivosus* and *H. Susannæ*, both of which are pure white, are equally worthy of extended cultivation. Growers who have hitherto failed to cultivate these Orchids satisfactorily may be encouraged by the fact that their cultivation becomes an easy matter when the needs of the plants are properly understood. At the present time the plants are growing freely, and should be housed in the East Indian house, or plant stove, where the atmosphere is hot and moist, placing them near to the roof glass in order that the stems may not become drawn and the flower spikes develop weakly. In addition to the ordinary shading, the glass immediately over

them should be stippled as advised in a former calendar, and the diffused light thus afforded is the most suitable for them. Afford the plants plenty of water at the root until such time as the flowers open, when the quantity should be gradually reduced. Thrip insects are particularly fond of these species, but may be easily kept down by vaporising the atmosphere, or by dipping the plants occasionally in some safe insecticide.

Epidendrum radicans.—The long panicles of bright orange-coloured flowers of this species are particularly adapted for furnishing vases, &c. Plants which have been in bloom for several months past should have the flower spikes removed from them, growth having already commenced. It is a plant of scant habit, and a number of stems may be planted in well-drained sphagnum-moss at the lightest end of the Cattleya-house. If they are put against a glass or brick-wall partition, the stems may easily be trained up towards the roof glass by means of cord or wires. The plant may be rapidly propagated by taking the off-shoots which appear on the old growth and flower stems and inserting them thickly in a large pot. Very soon numerous young roots will appear on the stems, and, as they increase in length, as many as possible should be guided into the sphagnum-moss. Throughout the growing season the plants should be kept moist, and be afforded frequent overhead syringings.

Epidendrum vitellinum.—This is another useful bright-flowered species, plants of which have been in bloom for a long time. When growth re-commences the plants may be re-potted if this is required. This species does not require much root-space, therefore the hanging pots, these being preferable to shallow pans, should be of a comparatively small size. Thoroughly drain the pots, and for a potting compost I have found nothing so valuable as the following mixture: good fibrous peat, leaf soil, and sphagnum-moss used in equal proportions, cutting the peat and moss up moderately small, and well mixing all the ingredients together. Pot each plant moderately firm, and surface the compost with about half an inch of chopped sphagnum-moss. Suspend the plants in a light position in the coolest part of the intermediate house, and afford them much moisture at the roots until they have completed their growth.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

Affording water and mulches.—In gardens where the soil is of a light nature it may now be necessary to apply mulches and afford waterings. Though the weather has been cold and dull, the amount of the rainfall has been rather below the average in most districts, and in the event of a spell of hot, dry weather, vegetable crops would soon suffer ill effects if they were not assisted in the manner now recommended. Peas, Runner Beans, Cauliflowers, and such crops are the first to require much attention, and the ground should be well hoed before the mulching is applied. The mulching should consist of half-rotted manure, but if this is not available, litter from the stables will have to be used instead, or even the mowing grass obtained from the lawns would make a good substitute, but this should have a sprinkling of litter thrown over it in order to make it more convenient for treading upon.

Winter vegetables.—These green crops should still be planted on the various plots of ground as they become vacant, and although the plants to be used now will be the small ones that were left from the first planting, they will have made nice sturdy specimens since the bed was thinned. If they fail to make such large plants as the earlier ones, they may "turn in" at an opportune time when such vegetables are becoming scarce. Whilst this work is proceeding, let an inspection be made of the previous plantings, that all vacancies that have occurred may be filled up. The season having been such a favourable one for the transplanting of brassicas, failures are likely to be fewer than usual.

Marrows, Gourds, and Cuscutas will require frequent waterings to keep them growing. Owing to the cold nights and winds, mildew will in some cases be appearing on Marrows and

Onions. Where this happens to be the case, it will be necessary to spray the plants overhead with sulphide of potassium (liver of sulphur) or with an approved mildew compound. Do not let the mildew spread unnecessarily before commencing to spray.

Salads.—Continue to make sowings of Cabbage and white-seeded Cos Lettuce, Radishes, Onions, etc. Towards the end of the present month and early in August the Brown Bath and black-seeded varieties of Cos Lettuce should be sown for raising plants to stand through the winter.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and
Open Spaces in the City of Cardiff.

Park by-laws.—For the maintenance of good conduct and order among visitors, and the preservation of property in public parks, it is usual to have them governed by a special set of by-laws. Common law is, as a rule, not specific enough, and too difficult of application to be of any great assistance in dealing with many of the matters which crop up from time to time in the management of a park. To give a simple illustration, let us take the case of trespass. It would be most difficult (if not impossible) to punish a person for being inside a public park during closed hours, by a process of common law, whereas the existence of a by-law to the effect that persons are not allowed within a park during certain hours makes it easy to do so, and thereby stop trespass. In the same way common law has no power to prevent visitors in a public park from playing football or any other game they choose on the best-kept lawn or among the flower beds so long as wilful damage could not be proved against them. By-laws, however, can deal with all such matters and make it a crime to do any of these things.

Legality of by-laws.—In England before by-laws can come into force they have to be sanctioned by the Local Government Board. In Scotland I believe this power belongs to the Court of Session. For the guidance of those about to draw up park by-laws the Local Government Board supplies a model set, which is exceedingly useful for the purpose. These are capable of meeting most requirements, but there are invariably local circumstances which make certain by-laws necessary in one place which are quite inapplicable in others. It would be as absurd to make by-laws regulating bathing, boating, and skating in a park devoid of water, as it would be unwise to omit them where a large lake existed.

Framing of by-laws.—Although the work of framing by-laws naturally devolves upon a lawyer, it is the park officials themselves who are best able to draw up the subjects about which they are needed. In drawing up such a list it is well to prepare for every contingency, and to make it as hard as possible for anyone to do mischief in a park by making it easy to punish them for doing so. I had once occasion to remark to the head of one of the largest park systems in this country that for a democratic city the by-laws in force in the parks under his charge were the most drastic I had ever known. His reply put the question in the proper light, when he said that they were made in the interest of the general public and for the express purpose of protecting their property in the most efficient manner—only evil doers had any reason to fear them.

Employment of by-laws.—Although the general idea of by-laws is that they are drawn up for the use of the authorities, it is well to bear in mind the fact that once they become law they can be put in force by any ratepayer who chooses to do so. For this reason great care has to be exercised in drawing up many of the by-laws so as not to hamper the department itself in the carrying out of its duties. For instance, in prohibiting the use of firearms in a park, it is policy to make a proviso that such prohibition will not apply to servants of the corporation when destroying vermin, &c., otherwise it would, in all probability, be quite within the rights of a ratepayer to take proceedings against a corporation for destroying rabbits by shooting them. What in many instances would be wrong for the public to do is needful on the part of the corporation's servants in the proper discharge of their duty.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 20—German Gard. Soc. meet.

TUESDAY, JULY 23—

Roy. Hort. Soc. Coms. meet.
Brit. Gard. Assoc. Ex. Council meet.
Rose Sh. in Manchester Botanical Gardens.

WEDNESDAY, JULY 24—

Nat. Carnation Soc. Sh. in R.H.S. Hall, Westminster.
Cardiff and County Hort. Soc. Sh. (2 days).
Harpden Fl. Sh.

THURSDAY, JULY 25—

Roy. Ulster Agricultural Society's Exh. and Fl. Sh., Balmoral, Belfast (2 days).
Horticultural Club (annual outing).

FRIDAY, JULY 26—Roy. Bot. Soc. meet.

SATURDAY, JULY 27—Lydney Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.6.

ACTUAL TEMPERATURES.—

LONDON.—Wednesday, July 17 (6 P.M.): Max. 73°; Min. 55.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 18 (10 A.M.): Bar. 30.2; Temp. 62°; Weather—Bright sunshine.

PROVINCES.—Wednesday, July 17 (6 P.M.): Max. 68°. Ireland, S.W.; Min. 62°; Lancaster.

SALES FOR THE ENSUING WEEK.

FRIDAY—

Choice imported and established Orchids in large variety. Orchids in flower and bud, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris, at 12.45.

From the results of some carefully conducted experiments with about 100 varieties of Tomatos, at the Maryland Agricultural Experimental Station, it was found that the varieties tested yielded produce which varied from 2 tons to about 20 tons, or 660 bushels, of fruit per acre. The average yield of all the varieties was at the rate of 11½ tons, or 390 bushels, per acre. The best ten varieties averaged 18 tons, or 603 bushels, per acre. The results show that the greater the number of cells in a Tomato fruit, the higher is the percentage of solid fruit. In 12 varieties having in their fruits more than 80 per cent. of flesh there was an average of 10.7 cells per fruit. The varieties having between 77 and 80 per cent. of flesh had 8.4 cells per fruit, and as the percentage of flesh decreases the average number of cells also decreases.

This fact points out one way in which the Tomato can be improved. The number of cells can be increased by the selection of seed from fruits having the greatest number of cells, and thus may the solidity of the fruit be increased.

In regard to manurial applications the

results showed that potash increased the crop more than either of the other elements of plant-food, and nitrogen stood next in this respect.

On a chemical analysis of the fruits grown with different artificial manures, it was found that potash has a tendency to produce a fruit with slightly less sugar, and more malic acid. Some of the sweetest Tomatos were grown by the aid of phosphates. Nitrogen and potash, when applied together, seem to have the most marked effect on the growth of Tomatos.

The following table shows a chemical analysis of 24 samples of Tomatos, comprising fruit, vines and roots:—

	Fruit.	Haulm.	Root.
	Per cent.	Per cent.	Per cent.
Water	95.45	79.41	73.31
Dry organic matter ...	4.55	20.59	26.69
Mineral matter (ash) ...	0.42	3.72	11.72
Phosphoric acid in the ash	0.05	0.04	0.06
Potash in the ash	0.27	0.39	0.29
Lime in the ash	—	0.55	0.30
Nitrogen in organic matter	0.16	0.31	0.24

Ten tons of Tomato fruit would remove from the soil about the same quantity of nitrogen and potash as 150 bushels of Potatos, but somewhat less of phosphoric acid.

Attention is directed to those portions of the plant which seldom receive consideration, viz., the haulm and roots. When the haulm is dug into the soil, both it and the roots decompose and their manurial properties become more or less speedily and completely available for succeeding crops. [The haulm should be removed from the ground and burnt if there is any reason to suspect that the plants have been attacked by disease; otherwise the disease may be communicated to future crops.] The crop that leaves the largest amount of these materials in and upon the soil adds most to the next year's store of plant-food, and to the fertility of the land.

The proportions of haulm and roots vary with different crops, and with the same crop according to its character. The relation between the amount of roots and tops is quite a variable factor, generally, however, with any given crop the greater the produce of fruit, the greater will be the amount of haulm and roots.

In the following table is shown the amount of valuable manurial elements in haulm and roots left on one acre of land from Tomatos and Potatos:

	Haulm and Roots.	Nitrogen.	Phosphoric Acid.	Potash.
	lb.	lb.	lb.	lb.
Tomatos	8500	27	4	84
Potatos	2000	9	3	10

The Tomato is not what may be called an exhausting crop, because, by its haulm and roots, if these are returned back to the soil, they impart four times as much organic matter or humus, three times as much nitrogen, and three times as much potash, with a little more phosphoric acid, than do the vine and fibrous roots of an average crop of Potatos.

The following experiments were conducted by Dr. Bernard Dyer, at Tonbridge, to ascertain the effect of nitrogenous manures upon Tomatos. The plants were grown out in the

open and were manured with dung at the rate of 25 loads (12½ tons) per acre, together with 6 cwt. of superphosphate and 1 cwt. sulphate of potash per acre. One plot was left without any further nitrogenous manure than was comprised in the dung; the other received a dressing of 2 cwt. of nitrate of soda per acre.

The results of two years' trials were as follows:—

Manures per acre.	Annual cost of Manure per acre.	Weight of Tomatos per acre.	
		1901.	1902.
	£ s. d.	Tons. Cwts.	Tons. Cwts.
12½ tons London dung, 6 cwt. of superphosphate, and 1 cwt. sulphate of potash	6 5 0	6 0	7 16
12½ tons London dung, 6 cwt. of superphosphate, 1 cwt. of sulphate of potash, and 2 cwt. of nitrate of soda	7 7 0	6 16	8 14

For the extra outlay of 22s. spent in nitrate of soda an increase of 16 cwt. of Tomatos was obtained per acre in 1901, and an increase of 18 cwt. per acre in 1902. Reckoning the fruit at 1d. per lb., the extra gain in 1901 would represent £7 9s. per acre, and in 1902 £8 8s. per acre.

The following formula has been recommended as a manurial mixture for Tomatos:

	Quantity per half Ton.	Cost at Wholesale Prices.
		£ s. d.
Sulphate of ammonia	320 lb.	1 15 8
Superphosphate	500 lb.	0 14 8
Sulphate of potash	300 lb.	1 6 9
	10 cwt.	£3 17 1

This mixture contains about:—6 per cent. of nitrogen, 7½ per cent. of phosphoric acid, and 13½ per cent. of potash. If applied at the rate of 4 cwt. per acre, this will give about 26 lb. of nitrogen, 33 lb. of phosphoric acid, and 60 lb. of potash per acre.

This manurial mixture at wholesale prices would cost about £1 10s. 9d. per acre.

For potting purposes the soil in which Tomato plants are to be grown should be well mixed with the manure in the proportion of about half a pound to a bushel of soil. After the fruit is set mix with the surface soil ½ oz. of the mixture per plant about every three weeks until the fruit is ripe.

Plants cultivated in pots indoors require more manure than Tomato plants in the open garden, owing to their restricted soil area.

OUR SUPPLEMENTARY ILLUSTRATION represents a view in one of the remarkable Italian gardens, found so numerous about the city of Rome, and in which architecture, statuary, fountains and other adornments occupy as prominent positions as the floral subjects. Many of these old gardens have been allowed to fall into decay, but in their ruined state they are interesting as showing how certain species of plants will survive and multiply under conditions of neglect. Mr. JAMES HUDSON, Gunnersbury House Gardens, Acton, who kindly sent us the photograph from which the illustration has been prepared, writes as follows:—"One of the most delightful excursions from Rome is that to Tivoli, 18 miles distant. It can be undertaken either by railway, by the steam tramway, or, if one has the time, by horse carriage. A visit to the Villa d'Este, on the west of the town, will

CASCADES, FOUNTAINS, AND AGAVES IN A ROMAN GARDEN.

Temple Press Ltd., Printers, 7 15, Rosebery Avenue, London, E.C.

repay the traveller. Unfortunately, the Villa is not now occupied, nor, indeed, to all appearances, has it been for several years past. The views, which extend to Rome and beyond, from the terraces are magnificent, the most prominent feature in the distance being the dome of St. Peter's Cathedral. The gardens, which slope rapidly towards the north, were designed with considerable skill. Towards the west are many acres of vineyards. The most prominent shrubs are the Sweet Bay, the Olive, and the upright-growing Juniper. The latter shrub has been planted at points of vantage, and there is a noble avenue formed of it, many of the trees being from 60 to 70 feet in height. The waterfalls, cascades, and fountains are most noteworthy. Evidently the designers had in view the importance of these adjuncts to a garden attached to a summer residence in a climate which is noted for its high temperature. These water-features are boldly executed, and a large supply of water is readily attainable from the River Arno. To wander in the shady groves of these gardens when they were in their former degree of splendour must have been delightful after the heat of Rome during the summer season. The Villa itself, which was built in 1549, is said to be one of the finest examples of architecture of the Renaissance period. It now belongs to a member of the Austrian Royal family."

THE GHENT QUINQUENNIAL, 1908.—How quickly these quinquennials seem to succeed each other, becoming formidable mile-stones! The schedule of prizes to be offered at the exhibition to be held next spring is now before us, and it is even more important than previous ones have been, because this exhibition will mark the centenary of the Société Royale d'Agriculture et de Botanique de Gand. The show will be opened on April 25, and remain open until May 2. Extra pains have been taken to ensure an even finer show than any previously seen at Ghent, and to the many British horticulturists who regularly attend the famous Ghent Quinquennials, and have appreciated their magnificent features in the past, that statement will convey much. There are 760 classes, divided into 29 groups, and in each class liberal prizes are offered. For new plants there are twenty classes; Orchids are invited to fill eighty-two classes, and as some of them are for large collections, there should be a magnificent display. In the twenty-sixth group there are fifty-two classes of a more or less scientific nature, and in which the exhibits will have some bearing upon the important questions of heredity, fixity of varieties, mutation, artificial selection, adaptation to environment, morphology, and many other important subjects. In the other groups nothing seems to have been forgotten in the matter of providing classes for everything likely to be available. Many British horticulturists look forward to the Ghent Quinquennials with pleasure, for, at these shows, they can combine business with pleasure. Since the last gathering in 1903, death has removed the popular president, Comte KERCHOVE DE DENTERGHEM, and the secretary, M. E. FIERENS, whilst many who regularly visited these exhibitions from this country are now no longer with us.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees will take place on Tuesday, July 23. In the afternoon a lecture will be given by the Hon. VICARY GIBBS, on "Rare Trees and Shrubs in the Open Air."

PRESENTATION.—Mr. T. BLENCOWE, who has filled the office of secretary to the Kingston Gardeners' Society for the past 12 years, was presented by the members, on the 12th inst., with a watch, on his leaving the district to take up new duties at Henley-on-Thames.

FLOWERS IN SEASON.—Messrs. C. S. DANIELS & SON, Wymondham, have sent us flowers of their strain of Sweet William (*Dianthus barbatus*), which they describe as "Auricula-eyed" on account of the colouring being in a clearly-defined ring on the usual white ground. The flowers are large, and the markings are in many beautiful shades of colours, some approaching blue.

—Messrs. JAMES VEITCH & SONS, LTD., send from their Coombe Wood Nursery flowering sprays of *Magnolia macrophylla* and *Stuartia pseudo Camellia*. The former has a very large flower of pale yellow colour, set in a rosette of leaves which measure more than 2 feet in length. The plant was figured in our issue for November 3, 1900, p. 325. The species of *Stuartia* forms a remarkably handsome shrub, and bears an abundance of white flowers along the whole length of the shoots. It was figured in the *Gardeners' Chronicle* for August 18, 1888, p. 187.

THE AMERICAN GOOSEBERRY-MILDEW IN ENGLAND.—Mr. ERNEST S. SALMON writes us on this subject as follows:—"Royal assent was given on July 4 to 'The Destructive Insects and Pests Act, 1907,' and the Board of Agriculture will now be able, under this new law, to issue an Order against the American Gooseberry-mildew. I wish to point out how matters stand at this juncture, and especially to emphasise the necessity for growers to co-operate with the Board to stamp out this new pest. During the past few weeks I have visited affected Gooseberry plantations in Worcestershire, Gloucestershire, and Norfolk, and in many cases I have seen the berries, leaves, and young shoots smothered with the white, powdery masses of spores of the American Gooseberry-mildew. Experience in this country has already shown (as it has in other countries on the Continent) that severe pruning in the winter and frequent spraying during the spring and summer months do not eradicate this disease, and that the only certain way of dealing with this pest, if we wish to stamp it out before it spreads through the country, is to grub up and burn the affected bushes. Already instances have occurred of considerable losses to growers caused by this new disease. In one case a grower discovered the disease in his nursery, and it was not until he had grubbed up and burnt the whole of his nursery stock, of the value of some £70, that the danger of the disease spreading to adjacent and extensive Gooseberry plantations was removed. In another case the loss was more serious still; for in a plantation of some 14 acres not only had all the Gooseberry bushes to be destroyed, but, as I found the mildew had spread to Red Currant bushes growing intermixed with the Gooseberries, it was necessary to grub up and burn these also, in order to ensure the eradication of the disease and safeguard the surrounding unaffected plantations. The total loss in this case amounted to some hundreds of pounds. In a third case a nurseryman lost a considerable sum of money through the necessity of having to burn a large stock of recently-imported standard Gooseberries affected with the disease. It is clear that growers are just beginning to experience the spread of a disease which, unless resolutely stamped out, will gradually invade and ruin their Gooseberry plantations, just as the 'Big Bud' mite has ruined Black Currant plantations. The disease has been allowed seven years' start in Ireland and two or three years' start in England. Now that the Board have at length acquired the necessary legislative powers to deal with the disease, it behoves all growers, and gardeners generally to co-operate heartily with the Board if they wish to see the American Gooseberry-mildew destroyed and their Gooseberry plantations remain healthy. Up

to the present the outbreaks that have occurred in England are as follow:—Kent: on standard Gooseberries only in one nursery (disease believed to be now stamped out). Worcestershire: 31 outbreaks in Gooseberry plantations. Gloucestershire: one outbreak. Warwickshire: one outbreak. Wisbech and district: two outbreaks."

SALE OF BOTANICAL BOOKS.—The following are some of the more important works disposed of at a recent sale held at Messrs. CHRISTIE'S auction rooms, King Street, St. James's:—*Salicetum Woburnense, or, a Catalogue of Willows Indigenous and Foreign at Woburn Abbey*, by the Duke of BEDFORD, 2 vols., finely-coloured plates, 1829 (only 50 copies were printed), £12 10s.; *Botanical Magazine*, by WILLIAM CURTIS, complete from 1793 to 1903, £86; *Edwards's Botanical Register*, 33 vols., 1815-47, £28; *Arboretum et Fruticetum Britannicum*, by J. C. LOUDON, 400 plates, 8 vols., 1844, £2 4s.; JAMES SOWERBY'S *English Botany*, coloured plates, original edition, complete in 30 vols., 1790-1814, £14 10s.; ditto, third edition, 1863-86, £14; ROBERT SWEET'S *British Flower Garden*, £12; JOHN EVELYN'S *Silva*, with portrait by BARTOLOZZI and coloured plates, a fine copy in contemporary tree-calf extra, 1776, £12 5s.; *The Orchidaceæ of Mexico and Guatemala*, by J. BATEMAN, 1843, 40 coloured plates, £7 5s.; *Flora Danica Iconum*, over 1,000 coloured plates, 17 parts in 6 vols., bound in morocco, 1764-87, £11 10s.; JOHN GERARDE'S *Herball*, enlarged and amended by THOMAS JOHNSON, 1636, £4 6s.; *Selectarum Stirpium Americanarum Icones*, by N. J. JACQUIN, 1750, 246 coloured plates, £17; *Description of the Genus Pinus*, by AYLMER B. LAMBERT, second edition, enlarged by Professor DON, 3 vols., 1838, £68 (Quaritch); *Reichenbachia, Orchids Illustrated and Described*, 192 coloured plates, Imperial paper edition, both series, 7 vols., 1888-94, £14; JAMES SOWERBY'S *English Fungi or Mushrooms*, with supplement and index, 440 coloured plates, 1797-1803, £11; *Plantæ Asiaticæ Rariores*, by NATHANIEL WALlich, 300 coloured plates, 1830-2, £13; *Les Liliacées*, by P. J. REDOUTE, 486 coloured plates, fine copy, 1802-16, 8 vols., £90.

THE ASSOCIATION OF ECONOMIC BIOLOGISTS held its fifth general meeting in the Imperial Institute on Thursday, July 4. The President, Mr. A. E. SHIPLEY, M.A., F.R.S., occupied the chair. After the formal business, the following papers were read:—By Mr. CECIL WARBURTON, "Some Notes on Ticks." The author dealt with the classification, means of distribution, and the leading generic characters. Mr. E. R. BURDON detailed the results of his experiments with the Spruce-Gall and Larch-Blight disease. His results showed that paraffin emulsion, applied early in the year, before the buds open, and whilst the insects are still hybernating, is the most effective insecticide. Mr. WALTER E. COLLINGE gave an account of his work on the Cecidomyiidae or Gall Midges, and appealed to entomologists and others for assistance in working out the life-histories, &c., of this very difficult family of Diptera. An abstract of a paper, by Professor A. D. IMMS, on a "Disease of Bees in the Isle of Wight," was read. Mr. E. S. SALMON read a short paper on the American Gooseberry-mildew, and the proposed legislative measures to check the importation of diseased plants. Mr. C. GORDON HEWITT discussed the binomics of the Calypterate Muscudae, and their economic significance. A demonstration was given by Mr. W. G. FREEMAN, the Superintendent of the Colonial Collections at the Imperial Institute, and visits were also paid to the Research Laboratories. The next meeting will be held at Edinburgh about Easter, 1908.

AGRICULTURAL EDUCATION.—The Departmental Committee held meetings on the 10th and 11th inst. The following witnesses attended, and were examined:—Mr. E. S. BEAVEN, Warminster, Wilts; Mr. CHRISTOPHER TURNOR, representing the County Councils Association; Mr. J. A. SMITH, Eastern Counties Dairy Institute, Ipswich; Mr. T. W. COWAN and Mr. WALTER F. REID, nominated by the British Beekeepers' Association; the Right Hon. HENRY HOBHOUSE, Chairman of the Somerset County Council, nominated by the County Councils Association.

THE "CITY PRESS."—This paper having been founded by Messrs. W. H. & L. COLLINGRIDGE in 1857, has just celebrated its jubilee. It has recorded the principal details of the municipal government and social doings of the Metropolis for the past 50 years.

PRINCE OF WALES AT THE SCOTCH AGRICULTURAL SHOW.—At the conclusion of the luncheon given in honour of the visit of the PRINCE and PRINCESS on the 9th inst. to the Highland Society's Agricultural Show at Prestonfield, Mr. JOHN METHVEN, of Messrs. THOMAS METHVEN & SONS, Edinburgh, under whose direction the grounds surrounding the pavilion were laid out, was presented to the PRINCE, who expressed admiration of the manner in which the pavilion and the grounds had been arranged.

PROPAGATION OF VIOLAS.—Mr. J. F. McLEOD, Dover House Gardens, Roehampton, writes as follows:—"As an admirer of Violas, I was pleased to read (see p. 33) of Mr. HAWES's success in the massing of them in beds. I have grown Violas in these gardens since the summer of 1890, and in no year have I had any serious disappointment in their cultivation. With the exception of injury from wire-worm, my plants have not caused me any anxiety. In 1893, which season, it will be well remembered, was very hot and exceptionally dry, I had a large bed planted with Violas, and by watering them once each week and damping them overhead every evening, the plants were enabled to last throughout the season remarkably well. There is no bedding plant that so well repays for the attention given it. We do not root the cuttings in hand-lights, however; this we have never done, as it is unnecessary, and much stronger plants can be produced by a full exposure to atmospheric influences. The cuttings are put in at about the end of September or early in October in a western border against a quick-set hedge. The position is not selected from choice, but simply as a matter of convenience. Young, soft cuttings are selected when these are forthcoming, and with the exception of occasionally damping them during dry weather, nothing further is done, and, although they have had 2 to 3 inches of ice over them, they have not suffered any ill effect. We root about 98 per cent. of the cuttings put in, and being thus exposed they form stocky plants which can be lifted early in March with an abundance of healthy roots and numerous side growths. In a short time they form the class of plant from which the best flowers may be expected."

TO STUDY FRUIT TREE PESTS.—The United States Bureau of Entomology will shortly establish somewhere near San José a big experiment station to study the insect pests which afflict the deciduous fruit trees of California. A liberal appropriation has been made for the support of the station for a period of two years, and at the expiration of that time it is expected that measures will be taken to make it a permanent institution.

RUBBER IN FRENCH WEST AFRICA.—The French Government is turning its attention to the better administration of the rubber forests of French West Africa. On the whole the quality of the rubber produced continues to improve, and prices have risen all round. The rubber, however, from the Ivory Coast and the Casamance district is still inferior to that from the other colonies, and somewhat strict measures are to be taken to improve it. The shortage in the export of rubber is due to adulteration which has made Ivory Coast rubber to a certain extent unacceptable in Europe, and, secondly, less rubber has been brought across the Gold Coast frontier from Ashanti to exchange for gunpowder at Aborisso. A special survey is being made of the chief rubber-producing districts, which will eventually be divided into three categories as follows:—(1) Unexploited districts. These consist only of a few regions in the Ivory Coast forests. (2) Districts which are exploited but have not been spoiled by excessive production and unscientific methods of collection. (3) Districts which have been spoiled for the above reasons. These latter are in the majority. When the survey and classification are complete, the GOVERNOR-GENERAL will, by decree, close the worst districts to rubber collection, so as to give the plants time to recuperate. A beginning will probably be made in 1908. *Journal of the Society of Arts.*

NEEDLES OF THE COMMON SPRUCE AS A PROTECTION FOR STRAWBERRIES.—At this season, writes a correspondent, attention might be called to the use of the needles of the Spruce Fir as a protective means against slugs. The branches of this species of Fir are often employed by gardeners to prevent the too early opening of the blossoms of the Apricot and Peach, and as a protection of the young fruits from late spring frosts. When these branches are taken from the trees, they should be placed in layers on the ground, and turned over several times, and they will cast their needles entirely, which, without much trouble, answer capably for strewing over the spaces between the Strawberry plants. The slugs are careful not to trespass on ground thus treated, the needles attaching themselves to their slimy bodies and remaining thereon, ultimately causing death. Later in the summer, the needles may be dug in. There is a slight disadvantage attached to the use of this means—they stick here and there into the soft fruits, but are readily removed when gathering. Fir needles can be purchased cheaply in great quantities, or obtained for the gathering in the woods in many parts of the country.

THE CAMPHOR INDUSTRY.—Mr. JAMES G. WILSON, of the American Department of Agriculture, recently declared that the United States was successfully experimenting in the production of camphor. He said that for years past the Department has been distributing camphor tree seed, and thousands of trees are now growing throughout the South and in the Pacific Coast States. Two years ago a serious effort was made to develop the manufacture of camphor from these trees. By improvements in manufacturing processes satisfactory results have been accomplished and a large manufacturing concern is now building up a camphor grove of 2,000 acres in Florida, from which it hopes to make its camphor. This firm uses more than 500,000 dollars' worth of camphor every year. From another source we learn that the Tokyo Government has on foot a project for the extensive planting of forests of camphor trees. The demand for camphor increases, having now reached over 10,500,000 pounds annually, and it will not be long until it reaches 13,000,000 pounds, says the Japanese authority.

A NEW HORTICULTURAL JOURNAL.—A horticultural journal in the Swedish language has been started at Helsingfors for circulation in Finland. The editor is a nurseryman, having a business in that town. The name of the new-comer is *Finske Trädgårdsolare*.

TOMATOS IN CANADA.—The summers in the Toronto district, if shorter than in England, are warmer, and the Tomato is largely planted as a field crop. When Tomato seedlings, states a Canadian contemporary, are about a month old from the date of sowing the seeds, they are pricked off about 3 inches apart; and when they begin to get crowded they are again transplanted at from 5 to 8 inches apart. The soil of the beds to which they are removed is made just rich enough to support the plants, as a very rich soil would favour too rapid growth, making the plants soft, which would retard their growth after they are planted in poorer soil. The manure is spread over the fields evenly and is afterwards worked with a disc-harrow twice or thrice to cut the manure very finely. The ground is then ploughed. This is done early in the year. Subsequent tillage consists of working the soil with a cultivator, the last time being a week before planting. The plants are set out in lines drawn at 8 feet apart, putting the plants at distances of 3 feet from each other. Plenty of space is thus allowed for the sun's rays to penetrate between the plants into the soil. The line is stretched across the field, and a man goes along it with a 3-feet measuring rod furnished with a tooth at one end, and with this he marks the stations where the plants will be set. It would appear that the practice of the ordinary cultivator in Canada is to place no stakes to his plants, but, on the contrary, to allow them to cover the soil; by the lining-out method, however, stakes are employed, as with us. A method called "square planting" is common, but the line method admits of as many plants being planted per acre with the advantages of greater heat in the soil, as stated above. The black rot in Tomatos is developed mostly in late-planted plots and those which have had too much manure.

CERTIFICATED ROSES IN THE U.S.A.—On the occasion of the meeting of the Executive Committee of the American Rose Society, held on May 28 last, in New York, at which meeting there was taken up the matters pertaining to the Washington Exhibition, it was resolved that a Certificate of Merit be awarded to the varieties Queen Beatrice (scoring 83 points), Rhea Reid (80 points), and a variety shown by Messrs. MYERS & SAMBMAN (81 points). The following varieties of climbing Roses, viz., Paradise, La Flamma, Delight, and Juanita, shown by Mr. H. WALSH, of Woods Hole, Mass., were awarded a Certificate of Merit, as recommended by the judges of the Washington Exhibition, March, 1907.

Publications Received.—*Liste des Plantes Cultivées dans les Serres Chaudes du Jardin Botanique de L'Etat à Bruxelles*, by Louis Gentil.—*Report on Economic Zoology for year ending April 1, 1907*, by Fred. V. Theobald, M.A., and issued by the South Eastern Agricultural College, Wye, Kent.—*Bulletin of Miscellaneous Information*, No. 6. From the Royal Gardens, Kew. This contains articles on "The Grasses of British Somaliland," by Dr. Otto Stapf (24 pages); "The Flowering of Cultivated Bamboos," by Mr. W. J. Bean; "Accession of Tropical African Plants from 1899-1906," by Dr. Otto Stapf; "New Species of Wild Fungi found in the Royal Gardens, Kew" (illustrated), by Mr. Geo. Massee; "Rhododendron Mariesii," by Mr. W. Botting Hemslay, F.R.S., &c.—*The Significance of Latent Characters: Some Latent Characters of a White Bean*, by Dr. George Harrison Shull. This article is reprinted from *Science*, pp. 792-794, Vol. xxv.—*The Country Gentlemen's Estate Book, 1907*. This work is the Year Book of the Country Gentlemen's Association, Ltd., 24-25, St. James's Street, London, S.W.—*A Simple Method of Bookkeeping for Farmers, Market Gardeners, and Dairy-men*, by H. W. Kersey. The author is lecturer in bookkeeping at the South-Eastern Agricultural College, Wye.—*Quarterly Journal of Forestry*, edited by W. R. Fisher.

THE SPECIES OF POTATOS.

ON Monday, the 8th inst., at the invitation of Mr. Arthur Sutton, a party of gentlemen visited the Reading Nurseries for the purpose of inspecting an interesting collection of plants representing almost all the known species of Potatos, *i.e.*, tuber-bearing *Solanums*. The primary object of the inspection was to determine if possible which species was the parent of the Potato of commerce—*Solanum tuberosum*—since, strange to say, this point has never yet been determined, *S. tuberosum* being, presumably, so named by Linnaeus from the cultivated plant of his time, and not from a wild form. The first exhibits consisted of plants raised from seeds and tubers received from Mr. W. Stuart, of the Vermont Agricultural Station, and assumed to be of the purely wild type of *S. tuberosum*, having been

these, however, agreed sufficiently with the cultivated Potato to be accepted without reserve as its progenitor, and the same may be said of *S. polyadenium* and *S. verrucosum*, of which plants raised both from seed and tubers were exhibited. *Solanum Maglia* was the next, and in connection with this it transpired that presumed specimens of this species raised from tubers first received from Kew in 1886 were not the same as the *S. Maglia* now growing at Kew, a fact attributed to the habit the species possesses of producing tubers a very long distance away from the haulm, and consequently liable to invade the area occupied by other plants. *Solanum Maglia* appears rarely, if ever, to produce fertile seed, but Professor Heckel, of Marseilles, reports that he has obtained a mutation from *Solanum Maglia* by "bud variation," that is to say, one of the tubers of *Solanum Maglia* gave an absolutely

instead of reproducing the parent type, showed the same remarkable variation in the seedlings which is common to the cultivated Potato when grown from seed, and not from tubers.

The next exhibit was *S. etuberosum* (grown at Reading successively for 20 years from tubers received from the Edinburgh Botanical Gardens), or the non-tuberous *Solanum*, a most misleading name, for it not only produces tubers and edible ones, but the *Solanum* genus is a very large one and includes many non-tuberous species. This species was considered by Mr. Sutton to be the most likely progenitor of the culinary tuber, and the bulk of evidence certainly supported that view as opposed to the idea that any of the *S. tuberosum*s so-called of the first exhibits could claim that distinction. *S. Commersonii*, together with some interesting crosses, were then shown side by side with its reputed offspring (by bud variation), "*S. Commersonii* Violet," an exhibit, however, which only tended to confirm the now generally accepted view that the two are quite unconnected, the latter being to all appearances only the well-known Potato "Blue Giant."

An unnamed species, termed merely "the African Potato," was remarkable for producing a large number of long thin stolons from its base, radiating in all directions over the surface of the soil.

As a sort of supplementary exhibit Mr. Sutton showed a facsimile of a water-colour drawing (see *Gardeners' Chronicle*, March 17, 1900, fig. 50), dated 1588, showing the cultivated Potato of that date, signed by the botanist Clusius and contemporaneously authenticated in other ways. Its exact resemblance to the Potatos of to-day in flower, fruit, and foliage, and in everything but the size of the tuber, which is small and irregular in shape, is remarkable, while it certainly was far from agreeing exactly with any of the wild species shown. The curious fact that in more than one of the wild species propagation by the tuber tends to degeneration, while the seedling plants are far more vigorous, finds a singular inversion in the fact that now that the habit of abundant and vigorous tuber production in cultivated Potatos is so common, the production of seed pods has become comparatively rare. Chas. T. Drury, F.M.H., F.L.S.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

SWEET PEA SPORTS.—The knowledge that Sweet Peas of the Countess Spencer type are specially amenable to cross-fertilisation because of their projecting stigmas, and hence their excessive sporting, is not new, for it has been known to many growers of Sweet Peas for some time past. I consider it is very doubtful that this structural peculiarity is entirely the cause of the sporting, for other varieties that have not a projecting stigma have sported appreciably, though none so freely as the Countess Spencer type. But the Sweet Pea is, of all seed-raised plants, peculiarly susceptible to sporting; indeed, the same thing is largely seen in edible Peas, and every seed-grower knows this is the case, even with old-fashioned stocks. A. D.

PROTECTION OF TREES FROM HARES.—Mr. F. V. Theobald, in his recent report, mentioned that he is unaware of the existence of any substance which will render trees distasteful to hares and rabbits; and he has suggested that information which I have been able to give him about one such substance might be of use to many fruit-growers. The substance which I have used for several years in Devonshire is called *Smeareolum*, and is obtainable from Thomas and Co., Ceres Chemical Works, Liverpool, at about 2s. 6d. the gallon. It is certainly effective, and though I do not quite like the appearance of the tree-stems after they have been treated with it, I have not yet traced any injury due to its use. *Spencer Pickering*.

FIG. 19. —CRINUM × H. J. ELWES (C. MOOREI × C. AMERICANUM): COLOUR OF FLOWERS PINK, OF A SHADE SIMILAR TO THAT OF AMARYLLIS BELLADONNA, BUT HAVING WHITISH CENTRES.

(See note on page 35 in the issue for last week)

collected in the wild state in Mexico. This species grows less than a foot high, comes perfectly true from seed, and seedlings are vigorous, but when cultivated from the tubers (which are not much larger than filberts) the plants are very weakly and consequently degenerate. This latter feature and the constancy found in the seedlings markedly distinguish the plants from the cultivated Potato, seedlings of which are notoriously variable, while the tubers produce healthy plants almost indefinitely. A quite distinct form, termed "*S. tuberosum* new species," also from the United States, was much stronger in habit, and like the former comes true from seed; this has its tubers mottled. A third distinct form, *S. t. boreale*, collected in Arizona, and received from the Rev. Aikman Paton, was next shown. None of

distinct type of Potato, originating while the parent tuber was under the surface of the ground, and that this variation when planted had produced a Potato apparently indistinguishable from the well-known cultivated Potato "*Vicar of Laleham*." It will be remembered that in the case of the so-called mutation from *Solanum Commersonii*, claimed by Mons. Labergerie, the result was a Potato considered by many experts as identical with the German Potato "*Blue Giant*." French scientists are divided in the opinions they hold, but in England few experts admit the possibility of one distinct species of *Solanum* or any kind of Potato having transformed itself directly into another by bud variation.

It is noteworthy that seedlings of this supposed mutation from self-pollinated flowers,

NARCISSUS POETICUS AS A MARKET FLOWER.

—Some of the newer hybrids of *Narcissus Poeticus* have now multiplied sufficiently to be available for market planting, and it will be interesting to observe whether or not they will prove a profitable crop. I have every confidence in them. When in conversation with a large market-grower, several years ago, he informed me that when he sent new and choice varieties of Trumpet Daffodils to market he found that they did not realise higher prices than did such standard and well-known kinds as Emperor, Golden Spur, &c., but that when he had sent new and improved varieties of *N. poeticus* he found a marked improvement in their price over those of the old *Ornatus* and others of the type. Recently I had occasion to write to a large grower for some bulbs of a new Poet's Daffodil, as I knew he held the main stock of the variety, but the reply I received was that he did not care to part with more than a very few bulbs, as he intended growing this plant for his cut-flower trade. Within the past two or three seasons stocks of improved varieties of *N. poeticus* have been sold for very high prices, in some cases the purchaser being a market-grower. There is certainly a scarcity of some varieties, which can only be explained by the fact that there is an extra demand, and in several cases prices have actually risen. All these things, to my mind, go to show that there is a good future for this beautiful and useful section of the genus *Narcissus*, and growers who are the first to cultivate the best of the "Pheasant-eye" *Narcissus* for market will find the investment a remunerative one. *F. Herbert Chapman.*

SUMMER PRUNING OF FRUIT TREES.—The tabulated results of summer pruning and the dates recommended for the practice on pp. 400-403 vary in an extraordinary manner, and set one thinking. It is obvious that some of the contributors confuse summer pruning with early disbudding, but they are quite different. It is also apparent that the fear indicated in the leading article on p. 404, that summer pruning may be performed too early, and thus cause basal buds which ought to remain dormant and in due time become fruit buds to burst before autumn into leafy shoots, is largely entertained. It is doubtful if this has ever been proved to have happened. Personally I have never seen it occur, and I have experimented not only on out-of-door fruit trees, but also on indoor ones, particularly vines. Reasoning from analogy, it is the buds on the hardened shoots which ought to burst from the base. If a soft-stemmed *Carnation* is pinched, the upper buds only break into growth, the lower ones remaining dormant; the same thing occurs in the case of the *Fuchsia*, the *Verbena*, and other flowering plants. In the limited space of a circular it is impossible to express one's opinions exactly, and after perusing the table in question I notice that my own meaning is not quite clear. Apples, it is remarked, are not treated. That refers to bush Apples, the only summer pruning which these receive being the removal of "water" shoots on over-vigorous trees, and these are burst off at the junctions of the shoots with the main stem. In the case of Apples trained to wires, practically all the pruning they receive is effected during the growing season. But the knife is employed as sparingly as possible, and mainly to cut off parts of spurs which are unfruitful and weak and in positions where they could never be otherwise. Most of the summer growths are rubbed off, but some broken off, and they are removed principally to admit sunlight to the foliage on the fruiting spurs. Plums require somewhat different treatment from other stone fruits, for their spurs may be allowed to extend several inches from the wall. But even with these trees one has to discriminate, for *Magnum Bonum*, *Monarch*, and other big-leaved varieties are grown more satisfactorily when they are closely pruned. Plums should be knife-pruned, leaving three to five leaves, but at the same time being careful to remove weakly shoots. Apricots require very little pruning if disbudded early in the year, and as a rule the knife is not needed in the case of these trees. In the case of Peaches, disbudding in early summer leaves nothing but the shoots bearing the present year's crops and those necessary for the next year's fruiting. At present the young growths require fastening to the wall and the lateral growths rigidly suppressed. Later, when the fruits have been gathered, any useless branches may be removed. Root pruning is

referred to by some of the compilers. In the rather light soil here, while it is essential to root-prune young trees in order to get them into training, after this has been secured it is beneficial in a greater degree to perpetuate a succession of fibrous roots by means of manual dressings either forked lightly into the soil above the roots, or to skim off the surface soil down to the roots and apply a dressing immediately above these, a surfacing of soil finishing the operation. This latter method is the best system for espaliers and cordons. A simple and efficient method of root-pruning consists in turning out a narrow trench all round the tree to the depth of a spade, and then pushing that implement as deep into the ground as it will go all around the tree. *R. P. Brotherston, Scotland.*

—Most gardeners will admit that summer pruning is especially necessary in the case of cordon, espalier, and wall-trained trees, because of their restricted growth and training; but pyramid, bush, and other trees of larger size, and whose growths are not so severely curtailed, do not require much pruning in summer. The results on pp. 400-403 are interesting, and, in some instances, amusing. On p. 424 Mr. Lewis Castle sums the matter up briefly, and, like Mr. Castle, I should like to have evidence that summer pruning produces fruit buds in the one season. I have never found it have that effect: the result is more biennial than annual. *T. H. Slade, Devonshire.*

Buddleia Colvillei.—As I was the first to bloom this beautiful Himalayan *Buddleia* in Europe, in or about the year 1891, and as I have grown and flowered it every year since, I must, with regret, take exception to the statement by the gardener at Culzean Castle (see p. 26) that it is perfectly hardy. It may be so at Culzean, and in ordinary years it is so on this mild sea-border, but in 1895 we had here on January 5 as much as 29 degrees of frost, and this very nearly killed my big plant. All but the central or main stem succumbed, and had to be cut away. Any severer frost would certainly kill it, so it can not be called perfectly hardy. Neither have I ever seen on it any of the subsidiary or axillary inflorescences mentioned by your correspondent, only the terminal bunches being produced on my plant, and even those are by no means abundant. *W. E. Gumbleton.*

—As I had the pleasure of seeing the handsome *Buddleia Colvillei* in bloom a short time ago in the south-west of Scotland, it is with pleasure I read Mr. Winter's note on p. 26 in the issue for July 13 recording its flowering at Culzean in Ayrshire. It has just flowered for the first time in the garden of Mr. W. D. Robinson-Douglas, of Orchardton, Castle-Douglas, Kirkcudbrightshire, on the shores of the Solway Firth, after having been in the garden for several years without showing flower. At Orchardton it is cultivated against a wall facing almost due west, where it occupies a considerable space and reaches a height of 10 or 12 feet. The weather last winter cut it rather severely, but in June it opened its first flowers, which were very beautiful with their handsome, rosy-red racemes. One would gather that the Culzean plant is not against a wall, and perhaps Mr. Winter will kindly give us some particulars of its precise position. Culzean Gardens are famous in Scotland for their tender shrubs, and the district seems to have a slightly milder climate than that in this part of the south-west of Scotland. I may add that the *Edwardsia* flowered for the first time at Orchardton alongside *Buddleia Colvillei*. The *Index Kewensis* spells the specific name of the latter plant as "Colvillei," while the *Kew Hand-list* makes it "Colvillei." The difference is not a great one, but it is well to be correct whenever possible. *S. Arnott, Sunnymead, Dumfries.* [B. Colville is correct, the species having been named after Sir James Colville, F.R.S., who at the time of its discovery was *Puisse* Judge of the Supreme Court of Calcutta, and President of the Bengal Asiatic Society. See *Botanical Magazine*, t. 7, 449.—Ed.]

RICHARDIA AFRICANA.—These plants have survived several winters uninjured in the waters of these gardens, where they are planted in clumps between other aquatics. They are now in flower, and the large, white spathes are borne a couple of feet above the water. *W. A. Cook, Leonardslee Gardens, Horsham.*

STRAWBERRY KENTISH FAVOURITE (see p. 33).

—The appearance of this variety is similar to *Leader*, but the difference in flavour is marked even in a season like this, when all Strawberries are at a disadvantage in this respect on account of the lack of sunshine. *Kentish Favourite* is a remarkable cropper, and Mr. T. Challis, of Wilton, writing in the *Gardeners' Chronicle* of June 15th, says: "I forced a few plants of this in the same house and concurrently with *Royal Sovereign* . . . the fruits set well, and ripened eight days before *Royal Sovereign*. They were solid and firm in texture, somewhat sweeter, and deeper in colour than *Royal Sovereign*, and possessed a distinct pine flavour." I doubt if the above remarks could apply to Strawberry "Leader." In addition to the Award of Merit from the Royal Horticultural Society, *Kentish Favourite* received the Royal Agricultural Society's "Certificate of Merit" at Lincoln this year. *Laurence J. Cook.*

—Since taking some plants and fruits of this variety to the Temple Show I have received so many requests for information as to how it was raised that I shall be glad if you will kindly insert the following particulars: *Kentish Favourite* was raised from seed saved from Captain, Waterloo, and Sensation, and was the only seedling worth saving out of all the batch. It is a little earlier than *Royal Sovereign* and produces at least four times the weight of fruit per acre and is of much better flavour. It has proved hardier than *Royal Sovereign*, and I have never seen a trace of mildew on it. Being a very dwarf, compact grower it can be planted closer together than other varieties, and if planted early will produce a heavy crop of fruits in the first season. *Walter R. Pierce, St. Dunstan's Nurseries, Canterbury.*

THE RAINFALL IN CARMARTHENSHIRE.

—Referring to Mr. W. A. Cook's statement on p. 33 as to the rainfall at Leonardslee Gardens, Sussex, it may be interesting to some readers to know what a difference there is between the rainfall in Sussex and that in Carmarthenshire. The rain measured here during the last six months is as follows:—January, 2.82; February, 2.90; March, 2.15; April, 3.99; May, 5.48; June, 6.27; total, 23.61. I may mention also that on July 11 our thermometer registered 1° of frost. *F. Surman, The Gardens, Golden Grove.*

THE KAKI.—Having grown the *Diospyros Kaki* for more than 10 years I can fully support the statements of *W. W.* in last week's issue, p. 22. My trees stood the winter of 1906-7 without injury on Streatham Hill, but a little shelter from extreme frost and cutting winds is desirable even in the south of England. The flavour varies considerably in the different varieties. The flavour of my fruits is mild and pleasant. They are free from seeds and easy to eat with a spoon when "bletted." *W. Roupell, Harvey Lodge, Roupell Park, S.W.*

BROAD BEANS COOKED AS SCARLET RUNNERS.—Those who want a nice vegetable for the table should pick Broad Beans when they are young—that is, when the Beans inside are no larger than an ordinary Pea. Cut the pods into thin slices, as is done with *Scarlet Runners*, and cook them in the same manner. When dished up they will have excellent flavour. I think all who do this will be pleased with the result. *L. H. Hallett.*

DARLINGTONIAS AND SARRACENIAS.—These insectivorous subjects are planted in the open at Leonardslee. They appear very brilliant when viewed in the sunshine. *Darlingtonias* do not flower with the same freedom as the *Sarracenias*, but they are nevertheless very pretty. *W. A. Cook, Leonardslee Gardens.*

ROSE A PARFUM DE L'HAY.—With reference to Mr. Gumbleton's note on this Rose in last week's issue (p. 25), I may state that it flowered here last year, and it is blooming at the present time. It is very fragrant, but it has certain defects. Colour is a matter of taste, but I do not care for its purplish tone. More serious, however, is the weak character of the flower-stalks, which are not strong enough to bear the flowers up, and the latter consequently droop when nearly expanded. It is not suited to a wet season, and both during last year—which was not by any means a wet one—and also this, many of the flowers did not open and the others were soon disfigured. In its perfume it reminds one greatly of some of the old garden Roses, such as the *Damask Rose*, and this is certainly a strong point in its favour. *S. Arnott, Sunnymead, Dumfries.*

SOCIETIES.

NATIONAL SWEET PEA.

JULY 16.—The seventh annual exhibition of this Society was held on this date in the Royal Horticultural Hall, Vincent Square, Westminster. The show was a success in every respect, and the finest ever held by this young and enterprising Society. The entries were more numerous than those of last year; they numbered 797, spread over 88 classes, and the bunches of flowers totalled 3,217, or 1,200 more than at the corresponding show of last season. The whole of the spacious Hall was filled with exhibits, even in the annexes, and three rooms were further requisitioned upstairs to hold some of the displays that could not be accommodated on the ground floor. That the exhibition is a popular one was evidenced by the large patronage afforded it by the general public. The weather was perfect. The arrangements left nothing to be desired, and the Secretary, Mr. C. H. Curtis, is to be congratulated on the success of the exhibition—the first during his term of office. Mr. BREADMORE again met with remarkable success in the principal open classes; but in the amateurs' section the principal winner of last year's prizes was excelled by other exhibitors. New varieties were numerous, and of these seven were selected for Awards of Merit, but none was deemed worthy of the Society's First-class Certificate. The finest new flower was the orange-scarlet variety, St. George. In more than one instance flowers shown under the name of John Ingman were disqualified. The only apparent difference was that they had hooded instead of waved standards.

SPECIAL AUDIT CLASS.

This was for 15 bunches of Sweet Peas, distinct. The schedule required the varieties to be selected from those following, which were the highest on the audit list of 1906:—King Edward VII., John Ingman, Gladys Unwin, Helen Lewis, Duchess of Sutherland, Dainty, America, Princess of Wales, Hon. Mrs. E. Kenyon, Jeannie Gordon, Navy Blue, Mrs. Walter Wright, Duke of Westminster, Black Knight, Lady Grizel Hamilton, Dorothy Eckford, Agnes Johnston, George Gordon, Helen Pierce, and Coccinea. The 1st prize consisted of the Sutton Silver Challenge Cup, the Gold Medal of the National Sweet Pea Society, and a monetary prize. Trade growers were excluded. Nine excellent exhibits were staged, and that shown by Mr. THOMAS STEVENSON, Woburn Place, Addlestone, was adjudged the best. His varieties were: King Edward VII., John Ingman, Gladys Unwin, Helen Lewis, Dainty, Princess of Wales, Hon. Mrs. E. Kenyon, Jeannie Gordon, Navy Blue, Mrs. Walter Wright, Duke of Westminster, Black Knight, Lady Grizel Hamilton, Dorothy Eckford, and Helen Pierce. The 2nd prize was awarded Mr. T. JONES, Bryn Penylan, Ruabon, Wales, whose best blooms were those of Helen Pierce, Dainty, Mrs. Walter Wright, Helen Lewis, Hon. Mrs. E. Kenyon, King Edward VII., Jeannie Gordon, and Dorothy Eckford. 3rd, Mr. H. H. LEES, Warblington Cottage, Havant.

In this class some of the exhibits were disqualified as not being true to name. This was seen in the case of flowers shown under the name John Ingman, but which had not the waved standard associated with that variety. Mr. A. E. USHER, Banston House, Blandford, Dorset, showed a splendid collection, but was disqualified for his specimens labelled John Ingman and George Gordon.

CLASSIFICATION CLASS (OPEN).

This was for a collection of 20 varieties of Sweet Peas including one variety only of each colour given in the Society's Classification Tables. It is intended to illustrate the colour distinctions in the Society's classification, and to bring into special prominence the finest varieties in the several colours. The prizes were given by the President, Sir George Cooper, Bart., Hursley Park, Winchester. The best display was staged by Mr. C. W. BREADMORE, 120, High Street, Winchester, although it was not much in advance of the 2nd prize exhibit shown by Messrs. G. & A. CLARK, LTD., Dover. Another good collection shown by Messrs. SALTMARSH & SON, Chelmsford, was awarded the 3rd prize. Mr. BREADMORE had superb flowers of Coccinea, Lady Grizel Hamilton, Jeannie Gordon, Lottie

Eckford, Countess Spencer, Romolo Piazzani, King Edward VII., Princess of Wales, Helen Lewis, Duke of Westminster, Duchess of Sutherland, Mrs. H. Wright, Black Knight, Agnes Johnston, John Ingman, Jessie Cuthbertson, Helen Pierce, and Dora Breadmore. Amongst Messrs. CLARKE's varieties were excellent examples of Gladys Unwin, America, Lady Grizel Hamilton, Beacon, Helen Pierce, Henry Eckford, George Gordon, &c.

COLLECTIONS OF SWEET PEAS (OPEN).

The largest class was that for 36 bunches of Sweet Peas in distinct varieties. This brought a good competition amongst five exhibitors. Mr. BREADMORE was again to the fore with a remarkably fine exhibit of flowers of large size on strong stalks, and with beautifully-developed colours, of such standard varieties as Mrs. A. Watkins, King Edward VII. (very fine), Agnes Johnston, Evelyn Breadmore (white, with a faint suffusion of pink), Audrey Crier, Miss Willmott, Janet Scott (a suffusion of pink on a yellow ground), Lady Cooper, Helen Pierce, Phenomenal, Mrs. Collier (yellow), Henry Eckford, and several seedlings of merit.

Messrs. CLARK were again 2nd. This firm had choice blooms, but they were shown with shorter stalks, and did not stand up so as to appear to the best advantage. Their best varieties were Dora Breadmore, Helen Lewis, King Edward VII., Dorothy Eckford (white), America (a beautiful flaked rose variety), Janet Scott, Beacon, &c. 3rd, Messrs. G. STARK & SON, Great Ryburgh, Norfolk.

Twenty-four bunches of Sweet Peas, distinct.—This important class was represented by six exhibits, and keen competition resulted. Mr. BREADMORE again won the premier prize, this time easily, with flowers of high quality, bold in spike, fine in colour, and clear of petal. His best bunches were those of J. T. Crier, George Herbert, Vera Jeffery, Princess of Wales, Tweedy Smith, Etta Dyke (white), Nora Breadmore, Helen Lewis, Audrey Crier, Bolton's Pink, and America. Again Messrs. CLARK, LTD., won the 2nd prize; 3rd, Messrs. SALTMARSH & SON, Chelmsford.

Twelve bunches of Sweet Peas, distinct.—This brought forth 12 displays, amongst which the flowers generally were of choice quality. None was, however, equal to those shown by Mr. BREADMORE, and he was again placed 1st for huge spikes of massive flowers, well selected in the matter of colours. We may select Prince of Asturias (dark crimson), Helen Lewis, Etta Dyke, Vera Jeffery (a suffusion of pale pink), Evelyn Breadmore, George Herbert (fine of colour), Mrs. H. H. Lees, &c., as the more notable varieties. 2nd, Messrs. ISAAC HOUSE & SON, Coombe Nursery, Westbury-on-Trym, Bristol.

AMATEURS' CLASSES.

Twenty-four bunches of Sweet Peas, distinct.—The 1st prize in this important class carried with it the Silver Medal of the Society. It was gained by W. N. RAWNSLEY, Esq., Alford, Lincolnshire (gr. Mr. T. Vickers), for a display remarkable for the length of the flower stalks, the fine colours of the flowers, and general excellence. He showed David R. Williamson, Nora Unwin, Henry Eckford (one of the finest vases of this superb variety seen in the Hall), Helen Lewis, Queen Alexandra, James Grieve (a fine yellow variety), Black Knight, Countess Spencer, Mrs. Walter Wright, Dorothy Eckford, &c. 2nd, Mr. SILAS COLE, Althorp Park Gardens, Northampton.

Eighteen bunches of Sweet Peas, distinct.—The best exhibit amongst six was that shown by G. D. FABER, Esq., C.B., M.P., Rush Court, Wallingford, Berks (gr. Mr. J. Dymock); 2nd, Mr. A. H. HICKMAN, Eagle and Spur Inn, Cookley, near Kidderminster.

Six bunches of Sweet Peas, distinct.—This class evoked a strong competition, and no fewer than 17 exhibits were displayed, the majority of which were of excellent quality.

Mr. SILAS COLES, Althorp Park Gardens, Northampton, won the 1st prize for choice examples of Lady Sarah Spencer, Helen Lewis, Navy Blue, Countess Spencer, S. Cole, Dorothy Eckford, Hon. Mrs. Kenyon, &c. 2nd, Mr. A. E. USHER, Ranston House, Blandford, Dorset, who had a remarkably fine bunch of the variety Henry Eckford.

New varieties.—The best twelve bunches of Sweet Peas three of each of the following new

varieties: Mrs. Alfred Watkins, E. J. Castle, Nora Unwin, and Frank Dolby, were shown by Mr. J. JONES, Providence Cottage, Souton Road, Wem.

ECKFORD CHALLENGE CUP.

A trophy called the Henry Eckford Memorial Challenge Cup, of the value of 50 guineas, was offered for 12 bunches of Sweet Peas of distinct varieties. The first prize also included the Gold Medal of the National Sweet Pea Society. The Cup must be won three times in direct succession before becoming the absolute property of any exhibitor. It was won for the first time last year by Mr. Thomas Jones, Ruabon, but this year Mr. JONES was 2nd to Mr. THOS. STEVENSON, Woburn Place Gardens, Addlestone. This formed the strongest class in the show, and no fewer than 18 displays were staged. The judges had no light task in arriving at a decision, for the exhibits generally were of high merit, and not much difference was seen in the first half-dozen displays. The decision went in favour of the exhibitor named, with Mr. JONES 2nd, and Mr. V. B. JOHNSTONE, Ryhall Hall, Stamford, 3rd. Not a weak bunch was seen in Mr. STEVENSON's display. His dozen varieties comprised Paradise (a magnificent bunch), Henry Eckford, Mrs. Collier, Rosie Adams (new), Nora Unwin, Helen Lewis, Black Knight, King Edward VII., Doris Stevenson, Mrs. Hardcastle Sykes, and Romolo Piazzani. Mr. JONES had very tall bunches arranged somewhat straggling, of Helen Lewis, Henry Eckford, Mrs. Hardcastle Sykes, John Ingman, Clara Curtis (yellow), Frank Dolby (heliotrope), &c. 3rd, Mr. V. B. JOHNSTONE, Ryhall Hall, Stamford, with a bright, clean lot, not so big as some, but of fresh appearance. Helen Pierce, Helen Lewis, Henry Eckford, Bolton's Pink, Jeannie Gordon, and Paradise were his best flowers.

HORACE WRIGHT CHALLENGE BOWL.

This trophy was offered for nine bunches of Sweet Peas, distinct, and the class was designed to draw special attention to varieties suitable for garden decoration. Competitors were required to make their selection from those following:—Apple Blossom, Lady Grizel Hamilton, Countess Spencer, Janet Scott, Venus, Peach Blossom, Princess Beatrice, Navy Blue, Little Dorrit, Dorothy Eckford, King Edward VII., Bronze King, Triumph, Mrs. Walter Wright, Lady Beaconsfield, and Salopian. It is required that the Cup be won three times, not necessarily in succession, to become the absolute property of an exhibitor. Five growers competed, with the result that Mr. A. BASILE, Woburn Park Gardens, Weybridge, was placed 1st for remarkably tall inflorescences of big flowers. He had King Edward VII., Janet Scott, Dorothy Eckford, Countess Spencer, Lady Grizel Hamilton, Mrs. Walter Wright, Peach Blossom, Venus, and Triumph. 2nd, W. H. RAWNSLEY, Esq. (gr. Mr. T. Vickers), Well Vale, Alford, Lincolnshire.

SPECIAL COLOUR CLASSES.

Prizes were offered for single bunches of Sweet Peas of certain colours. The winning varieties were as follow:—White, Dorothy Eckford; Blush, Duchess of Sutherland; Crimson, Queen Alexandra; Cerise, Coccinea; Rose and Carmine, John Ingman; Pink, Countess Spencer; Orange, Henry Eckford; Yellow and Buff, Dora Breadmore; Lavender, Lady Grizel Hamilton; Blue, Navy Blue; Mauve, Mrs. Walter Wright; Violet and Purple, Duke of Westminster; Maroon and Bronze, Black Knight; Magenta; George Gordon; Picotee-edged, Dainty; Striped and Flaked Red and Rose, America; Striped and Flaked Purple and Blue, Princess of Wales; Bi-color, Jeannie Gordon; Fancy, Agnes Johnston; Marbled, Helen Pierce.

Varieties with waved standards. Classes were provided for both trade and amateur growers, for varieties with waved standards. The best twelve bunches in the amateurs' section were shown by Mrs. TIGWELL, Harrow View, Greenford. This exhibitor had excellent examples of Helen Lewis, Mrs. Alfred Watkins (pale pink), Phenomenal, Enchantress (pink), E. J. Castle (carmine), Countess Spencer, Mrs. Hardcastle Sykes, Gladys Unwin, Geo. Herbert (carmine), Frank Dolby, Nora Unwin, and A. J. Cook.

The best collection in the traders' classes comprised the varieties Mrs. Alec Ware (white, tinged with pink), Olive Bolton (pink), Queen of Norway (heliotrope), Clara Curtis (yellow), Tom Bolton (dark maroon), Mrs. Chas. Foster (pale lavender), May Malcolm (pink), and Purity (white).

AWARDS OF MERIT.

Sweet Pea St. George.—This variety, the deepest and best of the orange-shaded flowers, is described on p. 36. It received an Award of Merit at the recent Holland House Show. From Messrs. HURST & SON, Houndsditch.

Elsie Herbert.—A flower suggestive of the variety Dainty, see p. 36. Shown by Mr. C. W. BREADMORE, Winchester.

Silas Cole.—A flower of the Black Knight type. The parts are very big and expanded; the colour is bluish-violet in the centre, shading to a deep maroon in the outer parts of the petals. Shown by Mr. SILAS COLE.

Nancy Perkins.—A flower of pale orange-scarlet, shaded with terra-cotta. The standard is frilled. Shown by Mr. H. A. PERKINS, York Lodge, Reigate.

The Marquis.—A large flower of lavender shade, with a big waved standard. The best variety of its colour. Shown by Messrs. DOBBIE & Co., Rothesay.

Rosie Adams.—A variety of unique shades of colours. The central parts are violet or heliotrope, and this merges to rose in a large standard. The inflorescence is of large size. Shown by THOS. STEVENSON, Woburn Place Gardens, Addlestone.

Evelyn Hemus.—A creamy-white variety with rose-coloured margins (see our issue for June 29, 1907, p. 427). Shown by Miss HEMUS, Upton-on-Severn.

NON-COMPETITIVE EXHIBITS.

Displays of Sweet Peas were shown by Mr. W. J. UNWIN, Histon, Cambridge (Gold Medal); Mr. C. W. BREADMORE, Winchester (Silver-Gilt Medal); Mr. HENRY ECKFORD, Wem, Shropshire (Silver Medal); E. W. KING & Co., Coggeshall, Essex (Silver-Gilt Medal); GILBERT & SON, Bourne, Lincolnshire; BAKERS, Wolverhampton (Gold Medal); J. CARTER & Co., Holborn (Silver-Gilt Medal); HOBBS, LTD., Dereham, Norfolk (Gold Medal); H. CANNELL & SONS, Swanley, Kent (Silver-Gilt Medal); JAMES VEITCH & SONS, LTD., King's Road, Chelsea (Silver-Gilt Medal); DOBBIE & Co., Rothesay, N.B. (Gold Medal); R. H. BATH & Co., LTD., Wisbech (Silver Medal); Mr. T. W. DARLINGTON, Warton, Carnforth (Bronze Medal); Miss HEMUS, Holdfast Hall, Upton-on-Severn (Silver Medal); WEBB & SONS, Wordsley, Staffordshire (Silver-Gilt Medal); G. & A. CLARK, LTD., Dover (Silver Medal); Mr. ROBT. SYDENHAM, Tenby Street, Birmingham (Bronze Medal); TOOGOOD & SONS, Southampton (Silver Medal); G. STARK & SON, Great Ryburgh (Silver Medal).

WOLVERHAMPTON FLORAL FETE.

JULY 9, 10, 11.—The annual floral fete, which took place on the above dates, compared favourably with the best of the 18 previous shows held in the West Park, Wolverhampton. If we except last year, when Roses and Sweet Peas were so splendidly shown, it is doubtful if a bigger or better exhibition has been seen at Wolverhampton. The exhibits were contained in five large marquees, and several new features were introduced. One was the provision of a special class for foliage plants, and another a class for pot fruit trees, prizes amounting to £57 10s. being offered in the former class, and £46 1s. in the latter. Unfortunately, rain fell heavily during a portion of the first day. Mr. W. E. Barnett, the courteous secretary, is to be congratulated upon the arrangements made for the convenience and comfort of visitors to the show.

PLANTS (OPEN).

This section was divided into seven classes, for which upwards of £190 was offered in prizes. The two leading classes were for groups arranged for effect on ground spaces not exceeding 350 square feet. One was for plants in and out of bloom, and the other for foliage plants only. There were three competitors in each class, and their exhibits were arranged in circles near each end of the tent containing the specimen plants. The 1st prize of £25 for plants in and out of flower went to last year's champions, Messrs. JAMES CYPHER & SONS, Queen's Road,

Cheltenham. The plants used were of excellent quality, and the arrangement light and graceful. A large Kentia crowned the centre of the group, around which brightly-coloured Codiaums, Caladiums, and well-flowered plants of Fuchsia triphylla and Clerodendron fallax, &c., were arranged. Eight small mounds in the body of the group, composed of a rich variety of flowering and foliage plants, together with sprays of choice Odontoglossums, were exceedingly pretty. The 2nd prize went to Mr. W. HOLMES, West End Nurseries, Chesterfield, and the 3rd to Mr. W. VAUSE, Leamington.

In the class for ornamental foliage plants, Ferns, &c., the LEAMINGTON NURSERYMEN & FLORISTS, LTD., Leamington, were placed first, with a very bright and well-balanced group, in which plants with silvery-grey, yellow, and reddish-coloured foliage prevailed. The 2nd and 3rd prizes were taken by Mr. W. HOLMES and Mr. W. VAUSE respectively.

In a class for 20 plants (of which eight were to be in flower) growing in pots not exceeding 8 inches in diameter, Messrs. JAMES CYPHER & SONS beat the other two competitors, Sir A. MUNTZ, Bart., M.P., Rugby (gr. Mr. H. Blake-way), and Mr. W. VAUSE, who were placed 2nd and 3rd respectively. The 1st prize collection contained 17 beautiful flowering specimens and three Codiaums.

The 1st prize of £10 for 12 plants (not fewer than six to be in flower) was also secured by Messrs. JAMES CYPHER & SONS. The principal plants were: *Ixora Williamsii*, *Rondeletia speciosa*, *Bougainvillea Cypheri*, *Statice intermedia*, and *Erica Cavendishii*. 2nd, Mr. W. VAUSE.

In a class for a collection of flowering plants, one kind only (any number of varieties of the same kind allowed), to occupy ground spaces 9 feet by 5 feet, there were four exhibitors, and, as in the previous classes, the premier award went to Messrs. JAMES CYPHER & SONS, whose plants of *Begonia Gloire de Lorraine* and *Turnford Hall* were of large size and abundantly covered with flowers. J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), was 2nd with a beautiful patch of *Streptocarpus*, bearing large flowers of good colours.

The best group of tuberous-rooting Begonias came from Mr. F. DAVIS, Pershore, whose double-flowered varieties were of immense size.

The best half-dozen exotic Ferns were staged by J. A. KENRICK, Esq., Edgbaston (gr. Mr. A. Cryer).

PLANTS (AMATEURS).

The 1st prize of £10 offered for a group of plants in or out of flower, arranged for effect, was won by J. A. KENRICK, Esq., with a collection of well-grown plants artistically arranged.

Sir A. MUNTZ, Bart., M.P., Rugby (gr. Mr. H. Blake-way), showed the best collection of six stove and greenhouse plants; and C. MARSTON, Esk., Compton (gr. Mr. W. E. Wall), won the 1st prize for Gloxinias.

ROSES (OPEN).

Notwithstanding the unseasonable weather, Roses were shown in good condition.

The 1st prize of £20 for 72 distinct varieties was won by Messrs. FRANK CANT & Co., Colchester, with superb flowers, amongst which Medea, Rev. Alan Cheales, Marie Baumann, Mrs. R. G. Sharman Crawford, Frau Karl Druschki, Killarney, and Florence Pemberton were particularly good. 2nd, Messrs. D. PRIOR & SON, Colchester.

In the class for 48 blooms, distinct, out of eight exhibits, the best came from Messrs. R. HARKNESS & Co., Hitchin, whose flowers, especially those of Ulrich Brunner, Mrs. W. J. Grant, Mrs. John Laing, and A. K. Williams were above the average merit. 2nd, Messrs. D. PRIOR & SON; 3rd, Messrs. B. R. CANT & SONS, Colchester.

For 12 distinct varieties (trebles), Messrs. D. PRIOR & SON were most successful, and showed lovely specimens of Bessie Brown, Mrs. W. J. Grant, and Countess of Caledon.

Messrs. PRIOR & SON also won the 1st prizes in the classes for (1) 24 distinct varieties, (2) 12 blooms of any dark variety, (3) 12 blooms of any light variety, and (4) nine varieties of Teas and Noisettes, as well as the Gold Medal and a sum of £2 offered for 12 varieties put into commerce during the years 1904-5-6. In a class for 12 Tea Roses, Mr. GEORGE PRINCE, Oxford, beat Messrs. FRANK CANT & Co.

The best exhibit of 12 bunches of Roses with foliage and buds as cut from the plants was from Mr. GEORGE MOUNT, who had exquisite flowers of J. B. Clark, Mrs. W. J. Grant, and Killarney; 2nd, Mr. JOHN MATTOCK, Oxford.

BOUQUETS AND CUT FLOWERS.

Competition for bouquets was poor, only two competitors staging exhibits in each of the three classes provided for these.

The exhibits with which Messrs. PERKINS & SONS, Coventry, gained the 1st prize for (1) bouquet for the hand, (2) bridal bouquet (with Orchids) and two bridesmaid's bouquets (Orchids excluded), and (3) feather-weight bouquet, were excellent. Mr. J. GARNER, Hale, was awarded the 2nd prize in each class.

Of the four exhibitors who competed in the class for a collection of hardy flowers covering a space of 15 feet by 5 feet, Messrs. G. GIBSON & Co., Bedale, won the 1st prize with a beautifully fresh group, in which were large masses of Iceland Poppies, *Tritoma Tuckii*, *Gladiolus Blushing Bride*, *Gaillardias*, *Campanulas*, *Pyrethrums*, &c.; 2nd, Messrs. HARKNESS & SONS, Bedale.

Mr. A. BASTOCK, Moseley, was responsible for the most tasteful arrangement of Pansies and Violas covering a space of 7 feet by 3 feet.

DINNER-TABLE DECORATIONS.

Eight tables were placed before the judges, who awarded the 1st prize to THE LEAMINGTON NURSERYMEN & FLORISTS, LTD., for a dainty arrangement of flowers, consisting of small-flowered Orchids, relieved with *Selaginella*, *Asparagus*, &c.; 2nd, Mr. W. J. GARNER, Hale.

The best collection of decorative plants and cut flowers arranged on a table measuring 6 feet by 4 feet came from C. T. MANDER, Esq., Compton (gr. Mr. J. F. Simpson), who made an effective display with Carnations, Cannas, and ornamental foliage plants.

SWEET PEAS.

For a collection of 18 varieties, the 1st prize of £3 and the National Sweet Pea Society's special Gold Medal was worthily awarded to Mr. C. W. BREADMORE, Winchester, for a superb collection. The varieties Audrey Crier, Vera Jeffrey, Helen Lewis, Dudley Lees, Queen Alexandra, and Evelyn Breadmore were very meritorious. Mr. T. JONES, Ruabon, secured £2 and the National Sweet Pea Society's special Silver Medal offered as 2nd prize.

Prizes offered by Mr. Henry Eckford, Wem, for 12 varieties only tempted three exhibitors. 1st, Mr. A. H. HICKMAN, Cookley.

Five competitors entered for the four prizes offered by Mr. Robert Sydenham, Birmingham, for 12 varieties. 1st, A. HUGHES, Esq., Knowle (gr. Mr. T. Parry), with a beautifully fresh lot; 2nd, Mr. T. JONES, Ruabon, who also gained the first prize of £3 offered by Messrs. Baker's, Wolverhampton, for 12 varieties.

FRUIT AND VEGETABLES.

These were well shown, the principal awards being as follows:—

The premier prize of £7 10s. offered for a collection of eight dishes of fruit was won by Lord SAVILE, K.C.V.O., Rufford Abbey (gr. Mr. J. Doe), with beautiful examples of Madresfield Court Grape, Stirling Castle and Dymond Peaches, Pine Apple and Downton Nectarines, &c. 2nd, The Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), whose exhibit included shapely, well-finished fruits of Lord Napier Nectarine and a splendid dish of Lady Sudeley Apples.

Lord SAVILE, K.C.V.O. (gr. Mr. J. Doe), also won 1st prizes in the classes for (1) four bunches of Grapes in distinct varieties; (2) two bunches of white; and (3) two bunches of black Grapes. J. H. KING, Esq., Ashford, Kent (gr. Mr. J. G. Weston), being 2nd in the first two classes, and the Duke of WESTMINSTER, Eaton Hall (gr. Mr. N. F. Barnes), 2nd in the other classes.

LORD HATHERTON, Penkridge (gr. Mr. H. Taylor), staged the best green-fleshed Melon (Earl's Favourite); and W. D. WINTERBOTTOM, Esq., Derby (gr. Mr. G. Brown), won the 1st prize in the class for scarlet-fleshed varieties.

Competition was strong in the Peach and Nectarine classes. The Duke of WESTMINSTER, Eaton Hall (gr. Mr. N. F. Barnes), had a lovely dish of Royal George Peach, and the dish of Humboldt Nectarine from Messrs. T. RIVERS &

SON, of Sawbridgeworth, was one of the best in the show.

A. HUGHES, Esq., Knowle (gr. Mr. T. Parry), carried off the 1st prize for three dishes of Strawberries, distinct varieties; and Lord ALDENHAM, Elstree (gr. Mr. E. Beckett), showed the best three dishes of Tomatos, distinct varieties.

FRUIT TREES IN POTS.

This new feature was a source of attraction to many visitors. The 1st prize of £20, given by the society, and £5 added by Mr. Alderman (RADDOCK, J.P.), for fruit trees in pots was well won by Messrs. T. RIVERS & SON, Sawbridgeworth, whose collection was displayed on low staging 20 feet by 9 feet erected in the centre of the specimen plant tent, and included trees bearing handsome fruits of Thomas Rivers and Sea Eagle Peaches, Early Rivers and Victoria Nectarines, Lemons, Oranges, Plums, Cherries, and Grapes. 2nd, THE KING'S ACRE NURSERIES, LTD., Hereford; 3rd, Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre).

VEGETABLES.—Messrs. Sutton & Sons' prizes were offered for six distinct kinds of vegetables, and of the six competitors, it was found that Lord ALDENHAM, Elstree (gr. Mr. E. Beckett), had the best collection; the EARL OF LATHOM, Ormskirk (gr. Mr. B. Ashton), being 2nd.

Messrs. Webb & Sons' prizes were for eight distinct kinds of vegetables. In this class the last-named exhibitor was placed first, and the Marquis of NORTHAMPTON, Northampton, (gr. Mr. A. R. Searle), 2nd.

Messrs. Webb & Sons also offered prizes for vegetables restricted to gardeners and amateurs residing within ten miles of Wolverhampton. 1st, Lord HATHERTON, Penkridge (gr. Mr. H. Taylor).

The best collection of six varieties of fruits (Pines excluded) staged by amateurs, came from Lord SAVILE (gr. Mr. J. Doe); and the 1st prize for a collection of ten kinds of vegetables was won by Lord ALDENHAM, Elstree (gr. Mr. E. Beckett).

HONORARY EXHIBITS.

Messrs. JARMAN & Co., Chard, Somerset, staged Roses, Sweet Peas, and sprays of Zonal Pelargoniums. (Silver Medal.)

Messrs. E. & H. SUCKLING, Wolverhampton, sent floral designs and miscellaneous cut flowers. (Gold Medal.)

From Messrs. SUTTON & SONS, Reading, came a nice display of fruit and vegetables, intermingled with graceful foliage plants and cut flowers. (Gold Medal.)

Messrs. HEWITT & Co., Solihull, Birmingham, had a very bright collection of hardy border flowers and Roses, in which Pæonies, Gladioli, Lilliums, Campanulas, and new Violas were conspicuous. (Gold Medal.)

THE BATHS AND PARKS COMMITTEE OF THE WOLVERHAMPTON CORPORATION (Supt. Mr. A. Webster), contributed a large group of miscellaneous flowering and foliage plants. (Gold Medal.)

Mr. ROBERT SYDENHAM, Birmingham, occupied a table with rustic stands decorated with Sweet Peas. (Silver Medal.)

Messrs. GEO. BOYES & Co., Leicester, sent cut Carnations. (Silver Medal.)

Messrs. DOBBIE & Co., Rothsay, contributed a large bank of flowers of a very fine strain of Antirrhinums, together with Delphiniums, Sweet Peas, and a large collection of Pansies. (Gold Medal.)

Messrs. BAKERS, Wolverhampton, occupied upwards of 900 square feet with hardy flowers, Sweet Peas, Roses, sprays of Zonal Pelargoniums, and a number of well-executed floral devices. (Gold Medal and Silver Cup.)

Messrs. T. RIVERS & SON, Sawbridgeworth, staged pot fruit trees and gathered fruit. (Gold Medal.)

Messrs. JAMES RANDALL & SONS, Shirley, Birmingham, sent a prettily-arranged group of cut Carnations. (Gold Medal.)

Mr. C. F. WALTERS, Balcombe, Sussex, showed a splendid lot of cut Carnations of the Malmaison, American and Border varieties. (Gold Medal.)

Messrs. WEBB & SONS, Stourbridge, showed a group of flowering plants, Sweet Peas, and a small collection of fruit and vegetables. (Silver Medal.)

Messrs. CLIBRANS, Altrincham, sent a pleasing group of hardy shrubs, in which variegated

Ivies, Japanese Maples, and the gold and silver-leaved varieties of Aralia sinensis were conspicuous. (Gold Medal.)

From Mr. JOHN E. KNIGHT, Wolverhampton, came a group of flowering and foliage plants and cut flowers. (Gold Medal.)

Messrs. DICKSON, Chester, sent Roses and hardy flowers. (Silver Medal.)

Messrs. TOM B. DOBBS & Co., Wolverhampton, made a large display on the lawn with rustic arches, &c., and flowering plants arranged in small groups. (Gold Medal.)

CROYDON HORTICULTURAL.

JULY 10.—This society held its annual show in the grounds of Brickenden House on this date. The weather was cold and rain fell at intervals, with the result that the visitors were comparatively few in number.

ROSES.

These flowers were abundantly shown, and generally the blooms were of fine quality. In the open classes, in which nurserymen competed, most of the prizes were won by Colchester firms.

In the class for 48 distinct varieties, Messrs. B. R. CANT & SONS, Colchester, were awarded the 1st prize and a Silver-Gilt Medal of the N.R.S. for fine large blooms, in the best condition, of such varieties as J. B. Clark, Caroline Testout, Maman Cochet, Comtesse de Ludre, Mildred Grant, Bartholomew Joubert (a fine crimson flower), Frau K. Druschki, and Gustave Grunerwald, the lighter coloured Roses being generally the finer. 2nd, Messrs. F. CANT & Co., Colchester, with an almost equally fine lot of flowers.

The best exhibit of 24 blooms, distinct, shown in triplets, were exhibited by Messrs. B. R. CANT & SONS. The following were notable varieties: Capt. Hayward (generally extra fine this year), A. K. Williams, Tom Wood, A. Colomb, and Duchess de Morny. 2nd, Messrs. D. PRIOR & SON, Colchester, for excellent blooms.

In another class for 24 blooms, distinct, Messrs. HICKS & BLOOMFIELD, of Bath Road, Reading, were awarded the 1st prize; blooms of Mildred Grant, Frau K. Druschki, Killarney, Capt. Hayward, Mrs. J. Laing, Mme. Jules Gravereaux were well shown in this exhibit. 2nd, Mr. F. J. JEFFERIES, nurseryman, Willis Road, West Croydon. His blooms were inferior in size to the Colchester Roses, yet many, such as Marquise de Litta, Mrs. McKee (a lovely creamy-white flower), and Countess Caledon, were very good examples.

In a class for 18 Tea or Noisette varieties, distinct, Messrs. B. R. CANT & SONS had the best display. In this exhibit we noted Souvenir d'Elise Vardon, S. de Pierre Notting, Maman Cochet, Bridesmaid, Mme. de Watteville, and Ernest Metz. 2nd, Messrs. F. CANT & Co. 3rd, Messrs. D. PRIOR & SON.

The best 12 Roses of one variety were shown by the last-named firm, the variety being Lady Ashdown. 2nd, Messrs. HICKS & BLOOMFIELD, with Mildred Grant. 3rd, Messrs. F. CANT & Co., with Frau K. Druschki.

In the similar class for 12 Teas or Noisettes, Messrs. B. R. CANT & SONS won with the variety Mrs. E. Mawley. 2nd, Messrs. F. CANT & Co., with the same kind. 3rd, Messrs. D. PRIOR & SON, with Maman Cochet.

AMATEURS.

The schedule provided for a new challenge cup competition, offered for 36 blooms, distinct. Many of the blooms shown in this class compared favourably with those grown in Colchester. The 1st prize was awarded to ALFRED TATE, Esq., Downside, Leatherhead, whose blooms of Gustave Piganeau, Capt. Hayward, Mme. Verdier, La France de '89, J. B. Clark, and Beauty of Waltham could scarcely be excelled. 2nd, E. J. HOLLAND, Esq., Silverdale, Sutton, with hardly an inferior bloom in his collection. The varieties Hugh Dickson, Suzanne Marie Rodocanachi, and François Michelin were all superb. 3rd, E. M. EVERSFIELD, Esq., Denne Park, Horsham.

Mr. TATE was also 1st for 24 Roses, distinct. 2nd, G. A. HAMMOND, Esq., Cambrian House, Burgess Hill.

For the best 18 Tea or Noisette blooms the

1st prize was won by F. SLAUGHTER, Esq., Steyning, who showed in good form the varieties Mrs. E. Mawley, Maman Cochet, Cleopatra, and Comtesse de Nadaillac. 2nd, A. TATE, Esq.

Mr. TATE was 1st in the class for 6 Roses, 3 trusses of each.

The class for 12 Roses, one variety, brought some very fine blooms. E. J. HOLLAND, Esq., was awarded the 1st prize. 2nd, G. A. HAMMOND, Esq.

The best 12 Teas were shown by Mr. E. M. EVERSFIELD; and in the class for 4 Roses, distinct, shown in triplets, G. A. HAMMOND, Esq., won the 1st prize. This last-named exhibitor won in the class for 12 Roses, distinct varieties, with excellent blooms of J. B. Clark, Mildred Grant, Hugh Dickson, and Mrs. S. Crawford, &c.

The schedule made provision for local Rose classes. The chief was that for 12 Roses, distinct, the 1st prize for which included a Challenge Bowl, of the value of 12 guineas, and the N.R.S. Medal. They were won by PERCY F. BECK, Esq., Hambrook, Wallington, for quite a moderate lot of flowers, the Silver-Gilt Medal being awarded for a bloom of Frau K. Druschki.

Table decorations were rather numerous, and showed good taste generally. Hardy cut flowers were greatly in evidence; Gloxinias were numerous and of good quality, and the same may be said of the display of Sweet Peas. There were many groups of various dimensions and these were pleasing in arrangement.

Begonias of the tuberous-rooting section were largely shown, and among them were exhibits showing good cultivation. Mr. MARTIN, gardener, Shirley Lodge, and Mr. SLATER, gardener, Homedale, exhibited the best Begonias.

The fruit consisted chiefly of Royal Sovereign Strawberries of great size, and bunches of white and black Grapes.

There were seen excellent vegetables, roots, saladings, and Potatoes, mostly cottagers' produce. The society assists greatly in forwarding the cultivation of vegetables in and around the town, and with admirable results.

Non-competitive exhibits from the trade were of much interest.

GLOUCESTERSHIRE ROSE.

JULY 9.—The 19th annual exhibition of this Society was held in the Corn Exchange, Gloucester, on this date. The entries totalled 192, as against 190 last year, and, notwithstanding the wetness and backwardness of the season, the quality of the blooms was excellent.

The cottagers' classes were a marked and encouraging feature of the show, both in point of view of number of entries and the quality and variety of the blooms shown. A new class for cottagers—three vases, any varieties, six blooms in each vase—secured a goodly number of entries.

In the nurserymen's classes the chief prizes fell to Messrs. ALEX. DICKSON & SONS, LTD., Newtownards; Mr. JOHN MATTOCK, Oxford; Mr. HENRY DREW, Longworth, Berks; Messrs. G. PRINCE & Co., Longworth; and Messrs. JOHN JEFFERIES & SON, Cirencester.

In the open amateur classes Mr. CONWAY JONES, of Hucclecote (who was a strong competitor for the champion trophy at the recent National Rose Society's show), secured all the first prizes, and was also awarded the N.R.S. silver medals for the best hybrid perpetual bloom, and for the best tea bloom in the varieties Mrs. John Laing and Mrs. Edward Mawley respectively.

In the Gloucestershire amateur classes, in which Mr. Conway Jones did not compete, Mr. W. J. THORPE, of Hucclecote, won a silver cup presented by Messrs. Jefferies & Son, Cirencester, for 18 varieties of Roses.

In the City of Gloucester amateur classes Mr. W. H. PICKFORD was awarded a silver salver, presented by the Mayor and Corporation, for the best display of Roses and Rose foliage only. Mr. A. V. WRIGHT won the Corporation triple Rose bowl for a display of Roses, and he also won the City High Sheriff's piece of plate for six varieties. Mr. W. H. PICKFORD was awarded the N.R.S. silver medal for the best hybrid Tea Rose in a bloom of Mildred Grant.

In the cottagers' classes, Mrs. BOLTON, Gloucester, was awarded a clock, presented by Mr. H. Terrell, K.C., for six Roses.

SOUTHAMPTON ROYAL HORTICULTURAL.

JULY 2 & 3.—The summer exhibition of this Society was held on these dates in the County Cricket Ground. The show was a great success, the exhibits being more numerous than usual and their quality good.

Roses.—Nineteen classes were provided for Roses, the principal one being that for forty-eight blooms of distinct varieties. Four growers competed in this class, and the 1st prize was won by Messrs. B. R. CANT & SONS, Colchester, with medium-sized well-coloured examples, of which the following were especially noticeable:—Mildred Grant (this was the premier bloom of the show), A. K. Williams, Helen Keller, Comte de Raimbaud, Dean Hole, Mme. Jules Gravereaux, and Richmond. 2nd, Messrs. D. PRIOR & SONS, Colchester, with slightly smaller flowers. Messrs. B. R. CANT & SONS also won the premier place for twelve triplets, with similar examples to those in the preceding class. 2nd, Messrs. F. CANT & Co., Braiswick Nurseries, Colchester.

Exhibits in a class for Tea or Noisette Roses in twelve distinct varieties were not numerous, but of high quality. Messrs. G. PRINCE & Co., Longworth, Faringdon, won the 1st prize with flowers of high merit, including such kinds as Mrs. E. Mawley, Boadicea, Princess Beatrice, Mme. Jules Gravereaux, and Innocente Pirola. 2nd, Messrs. F. CANT & Co.

Messrs. B. R. CANT & SONS won in the class for six blooms of any dark variety, with handsome, if small, examples of Richmond. Messrs. G. PRINCE & Co. won in a similar class for light-coloured blooms with Frau Karl Druschki.

Messrs. PRINCE & Co. also won easily in the class for garden or decorative Roses, with examples of Rainbow, Lady Battersea, Tea Rambler, Una, Climbing Papillon, &c., and for six bunches of single-flowered varieties.

A silver Challenge Cup, open to gentlemen's gardeners and amateurs, was offered for eighteen distinct Roses. This coveted award was secured by Mr. H. W. RICHARDS, Westridge, Ryde, with an exceedingly fresh, well-coloured set of popular varieties.

Tea or Noisette varieties were well shown in this section by Mr. F. W. FLIGHT, Cornstiles, Twyford, Winchester: The Bride, Bridesmaid, Mrs. E. Mawley, Maman Cochet, and Muriel Graham were some of his best blooms. Miss MINNIE SNELLGROVE, 10, Oxford Road, Southampton, worthily won the premier position for the best-arranged basket of Roses.

Sweet Peas were very finely and numerous shown in the many classes that were provided for these flowers. For fifteen bunches, distinct, the National Sweet Pea Society offered Gold and Silver Medals as the 1st and 2nd prizes. Mr. C. W. BREADMORE, Winchester, won easily with excellent bunches; 2nd, Mr. H. H. LEES, Warlington Cottage, Havant.

In the class for six bunches, the prizes for which were given by Messrs. Toogood & Sons, Southampton, Mr. Usher (gr. to Sir R. BAKER, Brantson, Blandford) was successful with good blooms well staged.

Hardy cut flowers were a feature of the show. Messrs. LADHAMS, Shirley, Southampton, won easily in the class for twelve bunches with a choice collection.

Messrs. PERKINS & SON, Coventry, showed the best bridal and the best ball bouquets.

Exhibits of plants were numerous and good. Mr. Hill (gr. to G. MERCER, Esq., Bassett, Southampton) had a highly-interesting group of miscellaneous plants arranged for effect, for which he secured the leading award.

Fruit was not plentiful, but it was good in quality. Mr. G. Ellwood (gr. to W. H. MYERS, Esq., Swanmore House, Bishop's Waltham) won in the classes for two bunches of black Grapes, and for one Melon. Mr. H. C. SIVYOUR (gr. to C. H. FARMAN, Esq., Rownhams House, Southampton) showed the best white Grapes in his bunches of Foster's Seedling.

Vegetables were very extensively displayed, and as many as 17 competitors were seen in a class for six dishes, and in which Mr. H. Pearce (gr. to Mrs. TRAGETT, Awbridge Danes, Romsey) won the 1st prize with a high-class exhibit. Messrs. Toogood and Sons, Southampton, presented the prizes in this class.

Messrs. Sutton & Sons, Reading, offered prizes for six dishes of vegetables, and this class provided a stiff competition. Mr. E. Beckett (gr.

to Lord ALDENHAM, Aldenham House, Elstree) won with produce of high quality. Mr. ELLWOOD followed closely. The last-named exhibitor won in the class in which prizes were given by Messrs. J. Carter & Co., High Holborn, London.

Trade exhibits were numerous, and they added much to the displays of the show. Mr. C. W. BREADMORE, Winchester, arranged eighty bunches of Sweet Peas in first-class style.

Messrs. DOBBIE & Co., Rothesay, also had a fine display of these popular flowers.

Mr. DUTTON, Iver, Bucks, showed Carnations of good quality, and Mr. BURNETT, St. Margaret's Nurseries, Guernsey, also showed fine blooms of these flowers.

Messrs. B. LADHAMS & SON, Shirley, had herbaceous flowers in much variety.

Messrs. ROGERS & SON, Southampton, showed Roses, shrubs, &c.

HANLEY FLORAL FETE.

JULY 3, 4.—This annual exhibition was held on these dates, and although the number of entries was somewhat smaller than at last year's display, the function proved a success. It was, perhaps, unfortunate that the show followed so closely upon that at Lincoln, for it undoubtedly prevented some growers from competing who would otherwise have done so. For this reason there were fewer entries in the group, Orchid,

THE LATE CHAS. JORDAN, I.S.O.

and Carnation classes, and the tent devoted to this section was in consequence not so well filled as it has been in some recent years.

The 1st prize for a group of plants occupying an area of not more than 300 square feet was secured by Mr. W. A. HOLMES, Chesterfield; 2nd, Messrs. J. CYPHER & SONS, Cheltenham. The best group of Orchids was shown by this latter firm.

Lord GROSVENOR, Tittensor Chase, Stoke-on-Trent (gr. John Scotney), exhibited the best group of Carnations in pots, and he was followed by Lord SHREWSBURY, Ingestre, Stafford (gr. Mr. E. Gilman).

In the class for 72 blooms of Roses of distinct varieties, the 1st prize was awarded Messrs. R. HARKNESS & Co., Hitchin, and this firm also won the 1st prize for 48 blooms, and 1st prizes in six other classes for these flowers.

The best collection of hardy flowers was shown by Messrs. G. GIBSON & Co., Leeming Bar, Bedale.

In the classes for fruits and vegetables, the principal prize-winners were the Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre); Earl of LONDENBOROUGH, Market Weighton (gr. Mr. J. C. McPherson); Earl of CARNARVON, Highclere Castle, Berkshire (gr. Mr. Pope); and Lord BAGOT, Blithfield, Rugeley (gr. Mr. Thos. Bannerman).

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JULY 3.—The exhibition at the Edgbaston Botanical Gardens on this date was a good one, but the weather was cold and wet. Two Silver-Gilt, two Silver, and two Bronze Medals were awarded. No awards were made to novelties.

The Rt. Hon. J. CHAMBERLAIN, M.P., Highbury, Birmingham (gr. Mr. J. Deacon), furnished nearly 300 square feet near the end of the exhibition hall with a beautiful group of flowering plants, consisting of varieties of Souvenir de la Malmaison and American Tree Carnations, Regal and Zonal Pelargoniums and Clerodendron fallax. Of the "Malmaison" Carnations, Princess of Wales (pink), H. J. Jones (deep crimson), Nautilus, and Sault were particularly good. The whole exhibit was well arranged. (Silver-Gilt Medal.)

Messrs. JAMES RANDALL & SONS, Shirley, Birmingham, showed a large group of cut flowers of American Tree Carnations and retarded Lilies of the Valley intermingled with foliage and miscellaneous flowering plants. (Silver-Gilt Medal.)

C. F. PRICE, Esq., Chad Mont, Edgbaston (gr. Mr. J. Beasley), sent a number of plants of Hydrangea Hortensia. (Vote of Thanks.)

Messrs. BAKERS, Wolverhampton and Codrall, sent a collection of Sweet Peas, including several new seedlings. (Bronze Medal.)

The most representative and best-arranged group of hardy flowers came from Mr. C. H. HERBERT, Acocks Green, who had large clumps of Heuchera macrantha, Gypsophila paniculata fl. pl., Pyrethrum James Kelway (flowers rich crimson), Delphiniums, Alpine species of Dianthus, and many uncommon rock-garden plants. (Silver Medal.)

R. FENWICK, Esq., Edgbaston, contributed a few well-flowered plants of Odontoglossum crispum. (Vote of Thanks.)

Mr. ROBT. SYDENHAM, Tenby Street, Birmingham, staged two dozen vases of Sweet Peas, and the same number of vases of Spanish Irises. (Silver Medal.)

From Messrs. RICHARD SMITH & Co., Worcester, came a nice collection of Pæonies and miscellaneous border flowers. (Bronze Medal.)

R. WILSON KING, Esq., Edgbaston (gr. Mr. D. Johnson), sent a small group of Gloxinias and foliage plants. (Vote of Thanks.)

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 4.—*Committee present:* Messrs. Ashworth, Ward, Smith, Cowan, Sander, Warburton, Leemann, Keeling, Walmsley, and Parker.

A. WARBURTON, Esq., Haslingden, staged a good group, consisting of Cattleyas, Odontoglossums, and some well-grown plants of Odontoglossum vexillarium. Lælia tenebrosa, var. Victor, was also included in the group. It is a beautiful variety with yellow sepals and petals. (Silver medal.)

Messrs. KEELING & SONS staged a small group of interesting plants, which included a fine plant of Stanhopea bucephalus; there were also some distinct varieties of Masdevallia in this group which was awarded a bronze medal. An Award of Merit was given to a new hybrid Cypripedium.

H. J. BROMILOW, Esq., Rainhill, exhibited Cypripedium Godefroyæ "Ran Lea var."

E. D. BOSTOCK, Esq., Stone, exhibited a good variety of Cypripedium niveum, var. "Supreme." P. W.

Obituary.

CHARLES JORDAN, I.S.O.—In our last issue we briefly announced the death of this distinguished gardener, which occurred at New Lodge, Hyde Park, on the 8th inst. The late Mr. Jordan commenced his horticultural training in the gardens of Baron Pollock, Hatton House, Hounslow, in 1860, and two years later he entered the gardens at Syon House. From Syon House he proceeded to Floors Castle, Kelso, and from thence, in 1868, became foreman in the gardens of Claude B. Hamilton, Esq., at Dalkeith, subsequently entering into business for himself as a nurseryman at Isleworth. He relinquished this business to assume control of the public parks

of Greenwich and Victoria. When the management of the latter was transferred by the Metropolitan Parks Act, 1887, to the Metropolitan Board of Works, the late Mr. Jordan was given the post of superintendent of Regent's Park, which office he held until his appointment in February, 1903, to the superintendence of Hyde Park, rendered vacant by the retirement of Mr. William Brown. The late Mr. Jordan was one of the ablest of park superintendents; he was most zealous in the discharge of his duties, and the vast amount of work he accomplished was remarkable. The post of superintendent of London's chief park involves the management of Kensington Gardens, St. James's Park, Buckingham Palace Gardens, the Green Park, Marlborough House Gardens, Parliament Square, and many minor gardens attached to public offices, and the present condition of each of these open spaces testifies to the skill and management of their late director. The new range of glasshouses and propagating pits in Hyde Park were designed by the late Mr. Jordan, and they will remain a monument to his capability. The many fine avenues in both the Green Park and the Mall, which serve as vistas leading to the national monument to Queen Victoria are also the result of the late Mr. Jordan's labours. During the 16 years he was superintendent of Regent's Park, he converted it into a veritable flower garden, and he added dells and water gardens, and other attractive features. The glass and nursery departments were entirely remodelled under his guidance, and the frame ground of this park was his especial pride. The late Mr. Jordan's nature was one of extreme kindness, and he was beloved by all whose pleasure it was to serve under him, as the present writer can testify. The investiture of the Imperial Service Order so recently conferred by the King was to have taken place on the 15th inst. Deceased leaves a widow, but no family.

LOUIS LACROIX.—We have to record the death of M. Louis Lacroix, who was once a well-known raiser of Chrysanthemums. Soon after the year 1880, when the popularity of the Chrysanthemum was advancing by rapid strides, M. Lacroix enriched our collections by introducing some excellent novelties from his nursery at Toulouse. Among them may be remembered such flowers in the Japanese section as *Dormillon*, *Mdlle. Lacroix* (a popular white flower), *Roi des Japonais*, *Tendresse*, *M. Ardene*, *M. Brunet*, *Mdlle. Moulis*, *Parasol*, *Mdlle. Marie Hoste*, and several others, not the least important of which were *Phœbus* and *Vivand Morel*, two varieties that continued for many years to be regarded as good exhibition flowers. *Jeanne d'Arc*, an incurved flower of great merit, was also sent out by M. Lacroix, as were several interesting Japanese-Anemone varieties, of which *Fabian de Mediana* was a conspicuous example. M. Lacroix was 66 years of age at the time of his death. C. H. P.

JOSEPH EWING.—We regret to hear, through our correspondent, Mr. Jno. Forbes, that this well-known gardener died about a fortnight ago at Strathtay, near Aberfeldy, in his 90th year. The late Mr. Ewing was gardener at Castle Menzies, Aberfeldy, for a period of 60 years. A few years ago he retired from the active management of the gardens and was succeeded by his son James, but continued to reside at Castle Menzies until May last.

DEBATING SOCIETIES.

BATH AND DISTRICT GARDENERS'.—The annual outing of this association took place recently, when a visit was made to Bournemouth. The weather fortunately was fine. The central and other local parks were visited by some members of the party, and others made a trip to Boscombe to visit the nurseries of Mr. M. Prichard, Christchurch.

BRIXTON, STREATHAM AND CLAPHAM HORTICULTURAL.—Through the kindness of Messrs. Sutton & Sons an opportunity was afforded the members on July 3 of visiting their nurseries at Reading. The trials of Peas and Lettuces were instructive. The copious rains have been favourable to both these crops. The breadths of annuals were interesting. *Nemesia strumosa* was seen in almost endless shades of colour. W. Roupell.

MARKETS.

COVENT GARDEN, July 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.D.]

REMARKS.—English Tomatoes are arriving in increasing quantities and are considerably cheaper. Cherries are sold at low prices, except very superior varieties. The trade for Hot-house Grapes and Peaches continues to be very quiet. Strawberries generally are now of poor quality and supplies are nearly finished. P. L., Covent Garden Market, July 17, 1907.

POTATOES.

Kents, 5s. 6d. to 7s.; Bedfords, 5s. to 5s. 6d.; Lincolns, 5s. 6d. to 6s.; Jerseys, 5s. 6d. to 6s.; St. Malos, 6s.; Teneriffe, 9s. to 10s.; old Potatoes, 6s. 6d. to 7s. Large consignments of Potatoes have been received during the past week, and prices have dropped accordingly. Trade generally is good. A. B., Covent Garden, July 17, 1907.

COVENT GARDEN FLOWER MARKET.

Many growers of spring and summer flowering plants have finished marketing these for the season, and some few things are realising good prices. Generally, however, plants are plentiful and the prices are low. Zonal, Ivy-leaved, and Show Pelargoniums are all plentiful. Amongst the best of *Crassula* (*Kalosanthes*) *coccinea* is the variety *Phoenix*; some of the cross-bred varieties of this plant are also good. Fuchsias are seen in well flowered plants. *Companula* *Mayi*, well flowered, is noticed on the plant stands. Supplies of *Hydrangeas* are falling off a little, but there are many good plants of *H. paniculata grandiflora*. *Koechia scoparia*, or what is known by some persons as *K. trichophylla*, is now very good. In *Roses* I noticed well flowered plants of the variety *Hiawatha*; other *Rambling* varieties are plentiful, but the plants are chiefly those that have been grown in the open and afterwards potted. *Coleus* in well coloured plants are plentiful, but there is only a small demand. I noticed some well grown plants of *Fu'ala japonica* variegata from Mr. T. Child's nursery. Ferns, *Palms*, *Aspidistras*, *Asparagus*, *Ficus*, *Aralias*, *Pandanus*, *Crotons*, and other useful foliage plants are all well supplied.

CUT FLOWERS.

White, yellow and blue flowers of *Statice* are prominent. *Alströmérias* are seen in various shades of colours. Iceland and Shirley Poppies are still very pretty. Several growers send these flowers when in the bud state; they open well in water, and last much longer than flowers that are fully expanded when cut. Spanish and English *Irises* are prominent flowers, these also last much longer if they are cut before they have fully opened, and the same is the case with many other flowers. Some *Carnations* have a reputation for remaining fresher longer than others, but the only difference I have ever been able to detect is that those which are the more readily fertilised deteriorate the quicker. This is seen in the case of the *Marguerite* varieties which seed freely, for these flowers pass as soon as fertilisation takes place. Sweet Peas have been over plentiful, and there must have been much waste in these flowers. *Roses* vary, the best sell well, but many of lesser quality cannot be cleared other than very cheaply. *Souvenir de la Malmaison* *Carnations* are prominent. The American varieties quite eclipse our ordinary type. *Liliums* have advanced a little in prices. The market is well supplied with all seasonable flowers and prices are, generally, very low. A. H., Covent Garden, Wednesday, July 17, 1907.

ANSWERS TO CORRESPONDENTS.

APPLE LEAVES: Rev. G. H. E. There is no disease present. The blotches are caused by a deposition of moisture followed by a chill.

APPLE SPOT: G. R. The markings are caused by a fungus, *Fusicladium dentriticum*. Spray the trees now with the Bordeaux Mixture (half strength), and again in the winter with a solution of sulphate of iron.

ASTER DISEASE: F. E. S. & Co. Select fresh ground for next year's planting, and take the precaution to spray the plants, before the disease appears, with the fungicide recommended in our issue for June 22, p. 416. The disease may be transmitted by the seeds, but this is improbable; fresh seeds, however, obtained from a healthy stock should be used for next year's sowing. If you do not wish to do this, treat the seeds from the affected plants with a weak solution of permanganate of potash in order to kill any spores of the fungus that may be present on them.

BOOK: J. F. Holstein. "Windsor Park and Forest"; published by Oxley & Son, High Street, Windsor.

BRITISH GARDENERS' ASSOCIATION.—W. F., Northallerton. The secretary is Mr. John Weathers, Talbot Villa, Talbot Road, Isleworth.

CAMELLIA LEAVES: W. H. P. The injury is caused by *Pestalozzia Guepini*, the dreaded "grey blight" of the Tea plant, which often attacks Camellias. The only certain remedy is to cut off every diseased leaf, as the spores are spread from one leaf to another by syringing the plants.

COLOURED PLATES: W. T. A., Capetown. We are unable to tell you where you could obtain the kind of plates you require.

CUCUMBER DISEASE: Old Subscriber. The leaves are affected with the spot disease that has been so often described in these columns. You can check the spread of the complaint by spraying with liver of sulphur, $\frac{1}{2}$ oz. to 2 gallons of water. All diseased plants should be burned and fresh soil should be used for future planting.

CUCUMBER PLANT: E. T. There is not any evidence of eelworms in the roots received. If you are a Fellow of the Royal Horticultural Society, you can have the water analysed on payment of a small fee, by sending a sample to Dr. J. Augustus Voelcker, M.A., 22, Tudor Street, New Bridge Street, London, E.C. The splitting of the Grapes is due to some fault in the regulation of heat and moisture, particularly in respect to the water applied to the roots.

ELM LEAVES: L. G. The fungus on Elm leaves is *Phyllachora Ulmi*, a parasite causing the early fall of the leaves when present in quantity.

GRAPE SPOT DISEASE: F. G. B., W. W. W. S., and North Essex. The berries are affected with the spot disease, which is caused by a fungus *Glæosporium ampelophagum*. Dust the bunches with a mixture of one part quicklime and two parts of flowers of sulphur. The use of stable manure in the border favours the disease.

HOLLYHOCK DISEASE: C. The following preparation is recommended by Messrs. Webb and Brand, the well-known cultivators of this flower:—To 1 lb. of Tobacco powder add $\frac{1}{2}$ oz. of finely-powdered sulphate of copper; well mix these, and dust the undersurfaces of the foliage with the mixture, at intervals of two or three weeks during the growing season, choosing a dull day with a still atmosphere for carrying out the operation.

EXHIBITING VEGETABLES: W. T. We know of no standard size for a stand to exhibit a certain number of vegetables, and you must be guided by your own discretion in this direction. It is necessary to afford sufficient space between the individual varieties to allow them to be displayed to advantage. A suitable stand for exhibiting vegetables is shown at fig. 21 (A) the back. (The diagram does not show this back as high as it is usually seen, but the exhibitor can modify the height as required). The back can be made of light boarding, and in front is a square portion (B) upon which the boards forming (C) rest, and slope to the front. The boards forming the platform (C) often meet (B) about three parts up, and not quite at the top, as is shown in our diagram. Against (A) are usually placed

FIG. 21.—STAND FOR EXHIBITING VEGETABLES.

Cauliflowers, Cabbages or Broccoli in pyramids, with Marrows, Cucumbers and similar large vegetables on (B). The space (C) is usually reserved for dishes containing Tomatoes, Mushrooms, Capsicums, Potatoes, &c., with the larger subjects at the back. A bedding of Parsley is placed over the whole staging before arranging the vegetables. The table (E), upon which the stand rests, is represented by the three bottom vertical lines in the diagram.

NAMES OF FRUITS: Peach. The fruits were not packed with sufficient care, and they suffered badly during transit. Correspondents would do well to remember that such soft fruits can only be identified with difficulty, and it is therefore imperative that every care should be taken in the packing of them, and that it is necessary for us to receive two fruits of each variety, also specimens of the foliage.

NAMES OF PLANTS: A. J. *Polygonum cuspidatum*.—W. H. and A. K. We do not undertake to name varieties of *Roses* or other florists' flowers.—C. W. *Calycanthus floridus*.—R. A. H. 1, *Spiræa arizæfolia*; 2, *Rhus Cotinus*; 3, *Cistus ladaniferus maculatus*; 4, *Erigeron speciosus*.—F. R. 1, *Escallonia rubra*; 2 and 3, *Rosa spinosissima* var.; 4, *Veronica salicifolia*; 5, *Azalea viscosa*; 6, *Coronilla Emerus*.—A. T. B. *Jasminum humile* (J. revolutum).—A. C. 1, *Picea nigra*; 2, *Cephalotaxus pedunculata*; 3, *Berberis vulgaris* var.; 4, send better specimen.—W. J. S. 1, *Robinia Pseudacacia*; 2, *Cupressus Lawsoniana*; 3, *C. macrocarpa*; 4, *Pinus excelsa*.—G. F. M. 1, *Rhodotypos kerrioides*; 2, *Lonicera Ledebourii*; 3, *Philadelphus Lemoinei*; 4, *Olearia Gunniana*; 5, *Gaultheria Shallon*; 6, *Verbasicum phoeniceum*.—A. N. 1, *Eunonymus europæus*; 2, *Rhus Cotinus*; 3, *Veronica salicifolia*; 4, *V. speciosa*

var.—G. B. 1, *Lonicera japonica*; 2, *Crambe* sp., probably *C. orientalis*, but we are unable to name it definitely without complete material.—K. & B. The *Retinospora*, or juvenile form of *Juniperus virginiana*.—G. W. R. *Potentilla variabilis*, *P. coccinea* of gardens.—R. A. 1, *Cystopteris bulbifera*; 2, *Lastrea dilatata*; 3, *Polypodium vulgare cambricum*; 4, *Pteris arguta*; 5, *Pteris umbrosa*; 6, *Woodwardia orientalis*.—Veritas. 1, *Aerides odoratum*; 2, *Sarcanthus pugioniformis*; 3, *Saccolabium ampullaceum*; 4, *Schomburgkia tibicinis*.—R. T. S. 1, *Kalmia latifolia*; 2, *Prunus Pissardii*; 3, *Acer Negundo*; 4, *Aconitum Napellus*; 5, *Malva moschata*; 6, *Achillea Ptarmica flore pleno*.—A. B. 1, 2, and 3, varieties of *Iris xiphoides*, commonly called English *Iris*; 4, *Penstemon barbatus*; 5, *Deutzia crenata flore pleno*; 6, *Robinia Pseudacacia*.—Juno. *Phyllocactus crenatus*.—W. J. F. 1, *Calycanthus floridus*; 2, *Spiræa salicifolia*; 3, *Spiræa brumalis variegata*; 4, *Melanthus major*; 5, probably *Convolvulus Cneorum*. Send when in flower. 6, *Rehmannia angulata*.—Miss M. C. *Astrantia major*.—G. S. J. Your labels were nearly all detached from the specimens; the red flower is *Calycanthus floridus*, the yellow flower *Grevillea juniperina sulphurea*; 2, *Phlomis fruticosa*; 3, *Cotoneaster frigidus*.

PEAR LEAVES INJURED: A. G. L. & W. K. The injury has been caused by the Pear-leaf blister-mite. Spray the trees thoroughly with paraffin emulsion prepared by boiling together equal proportions of paraffin and soft soap. This should be thoroughly mixed with 25 times its bulk of water. Spray in the autumn and again in the early spring when the leaf buds are expanding.

PLANTS LOSING THEIR LEAVES AFTER PURCHASE: A. T. It often occurs that plants sent to market are not sold on the first day, and after they have been confined in the close atmosphere of the market-hall the leaves suffer when they are again exposed to the air and light. It is much the same with many plants used for the decoration of dwelling rooms; they may not appear to suffer at the time, but when returned to their usual position the leaves soon fall, or turn a bad colour. There is also another cause for plants purchased from the market failing in the manner described. Such plants are often fed excessively with manures, and when these are withheld they suffer. In other instances they may have been subjected to an excessive degree of forcing. We may be able to give you the names of the Poppies, *Convolvulus*, &c., in our next issue.

ROSES: J. A. There is no disease present; the trouble is caused by the weather, against which there is no remedy.—W. K. The Rose leaves are attacked by a fungus called *Actinonema rosæ*. Spray with a rose-red solution of Condy's Fluid. Collect and burn diseased leaves.

STRAWBERRIES: G. S. We are unable to account for the pilfering.

SYCAMORE: B. L. The leaf you send is that of *Corylus maxima* var. *atropurpurea*. There is no form of the Norway Maple or the Sycamore with foliage of so deep a colour, though some of the forms of the latter, such as *purpurascens* *Nizeti* are somewhat like it in early summer. There is no purple-leaved Plane, but there is a purple-leaved Elm (*Ulmus montana* var. *atropurpurea*) which you might easily have mistaken at a distance for an Acer.

TOMATOS DISEASED: J. S., Holyrood. The black spots on the fruits are caused by a fungus—*Macrosporium Solani*. There is no known remedy for this disease once the fruits are attacked, but the spread of the complaint may be largely checked by burning the affected fruits as soon as the disease shows itself. Later batches should be sprayed with the Bordeaux mixture.

ARRANGEMENT OF THE HARDY FLOWER BORDER.

IN undertaking the construction or rearrangement of an herbaceous border, the experienced gardener very properly aims at obtaining as prolonged a succession of colour as possible.

A well-arranged border of carefully-selected flowering plants is always a thing of beauty, but how much of that possible beauty is often sacrificed by faulty selection and disposition in the beginning? A brilliant colour display may be striking, but it is not necessarily artistic. To be artistic it must possess a certain individuality of its own, obtained by planting with a view to obtaining contrast and bold effect, and, in considering the choice of material for such a border, diversity, not only of colour, but of foliage should be taken into careful consideration. It is to the introduction of bold and effective foliage plants that the well-conceived border owes much of its artistic character.

The practice of arranging the taller plants in rows along the back, and the smaller ones

in similar rows along the front of the border, should be avoided, or the effect is sure to be monotonous. Care, however, should be taken that each plant is so disposed that it will be displayed to good advantage. The outline of a border presents an ever-varying change of front, effected by allowing the bolder subjects to project to the front and the dwarfier kinds to recede towards the back of the border at irregular intervals. Bearing these principles in mind, their employment must be regulated according to the size of the border and the purpose for which it is intended; much depends, for instance, upon whether the border is intended as a constant ornament for the more select part of the garden, or mainly for the production of cut flowers. From a border of the latter type many highly ornamental subjects must necessarily be excluded, and its effect will consequently depend largely upon the manner in which the plants are arranged. In the case of the ornamental flower border, there is a much wider scope, and few branches of gardening offer greater opportunities for the exercise of artistic skill. An important adjunct to the ornamental flower border is an effective background of flowering shrubs, in conjunction with which herbaceous plants of the boldest type can often be utilised. The outline of the shrubbery itself should be thoroughly broken up, now projecting, now receding in such a manner as to allow plenty of room for the adornment of the open spaces with suitable herbaceous plants. The position of the shrubs of which such a background is composed should be graduated in such a manner that the coarser and more spreading kinds are put well into the background. Flowering shrubs of a smaller and more select type are also valuable for planting singly, or in smaller groups among the herbaceous plants, and not only do they impart to the border much additional character during the summer months, but help to maintain that character throughout the winter, at which season they brighten what might be otherwise a more or less dreary stretch of bare ground.

However desirable the inclusion of flowering shrubs may be, it is necessary that their characteristics and uses should be thoroughly understood, otherwise the result may prove a failure. Having decided upon the position of the border, and the principles upon which it is to be planted, the selection of suitable plants that will impart an appearance of individuality comes into consideration. The following are lists of desirable subjects for the purpose:—

HERBACEOUS PLANTS OF BOLDEST TYPE.

These are only suitable for cultivation in large borders of a semi-wild character: *Bocconia cordata*, *Heracleum* in variety, *Rheum*, *Polygonum* in various species, of which *P. cuspidatum* and *P. sachalinense* are the best, *Silphium* in variety, *Lavatera*, *Grasses*, *Gynierium argenteum*, *Eulalia japonica*, *Arundo conspicua*, &c.

PLANTS OF SUB-TROPICAL APPEARANCE.

Aconitums, *Acanthus*, various species of *Astilbe* (of which the new *A. Davidii* is the best), *Centaureas* (of which *C. babylonica* and *C. macrocephala* are the most striking), *Delphiniums* in variety, *Echinops* (of which *E. ruthenicus* and *E. sphærocephalus* may be recommended), *Hollyhocks* in variety, *Ferulas* in various species (of which *F. gigantea* is the

tallest), *Romneya Coulteri*, *Galega officinalis*, *Michauxia campanuloides*, *Molospium cucurbitarium*, *Rudbeckia laciniata*, *Ostrowskia magnifica* (a recent introduction of very bold appearance), *Lupinus* in variety, *Podophyllum Emodi*, *Senecios* of various species (such as *S. Clivorum*, *S. japonicus*, *S. pulcher*, and the new *S. tanguticus*), *Crambe cordifolia* (especially desirable), *Morina longifolia*, *Papaver orientale*, *Eryngiums* in variety, &c.

PLANTS WITH SWORD OR GRASS-LIKE FOLIAGE.

Aciphylla squarrosa, *Asphodelus* in variety, *Libertia formosa*, *Hemerocallis* in variety, *Galtionia candicans*, *Kniphofia* (various species, among which *K. caulescens*, *K. nobilis*, *K. grandis* and *K. Tuckii* are the tallest and most distinct), *Montbretia crocosmæflora*, *Eremurus* in variety (of which *E. robustus* and *E. Himalai-cus* are the tallest growers); *Iris*, various species, such as *I. Monnieri* and other strong-growing kinds; species of *Yuccas*, *Phormium tenax*, *Liatris* (Snake Root) in variety, *Sparaxis pulcherrima*, &c.

PLANTS OF DWARFER GROWTH.

Anemone japonica and its varieties, *Funkia* species, *Ranunculus aconitifolius*, *Helleborus* in variety, *Megasea* (various species), *Pæonies* in variety, *Spiræas* (*Astilbes*) such as *S. palmata*, *S. japonica*, *Tiarella cordifolia*, *Incarvilleas*, *Heucheras*, *Galax aphylla*, &c. Borders that are situated in partial shade should also include such plants as *Tradescantia virginica*, *Polygonatum multiflorum*, and hardy Ferns.

FLOWERING SHRUBS.

The following species are suitable for associating with herbaceous plants: *Berberis Darwinii*, *B. stenophylla*, and *B. empetrifolia*, *Cytisus* (several species), *Erica lusitanica*, *Pæonies* in variety, *E. mediterranea*, *E. Veitchii*, and *E. carnea*, &c., *Pernettya mucronata*, *Skimmia japonica*, *Veronica Traversii* and *V. buxifolia*, *Daphne* (several species), *Olearia Haastii*, *Euonymus japonicus*, *Forsythias* in variety, *Choisya ternata*, *Cistus* (several species), *Escallonia macrantha* and *E. floribunda*, *Andromeda polifolia*, *Kalmia angustifolia* and *K. latifolia*, *Phillyreas* in variety, climbing *Roses*, *Lavendula vera*, *Rosmarinus officinalis*, *Artemisia*, and others. *P. Meyer*, *Abergele, N. Wales*.

THE FLORA OF PALESTINE.*

THE idea of this little book grew out of a tour in Palestine. . . . It seemed to me that a short account of the trees and flowers, with special reference to those mentioned in the Bible, might be of use to travellers . . . and also of interest to students of the Bible." The information, we are told, was partly gleaned from Canon Tristram's work, the *Treasury of Botany*, and Dr. Post's *Flora*.

The book consists of four chapters dealing with the characteristic flowers of Palestine, e.g., thorny plants, tropical and Alpine plants and trees, occupying 44 pages; the remainder of the book of 128 pages is an alphabetical list of the majority of species, with brief descriptions of the genera. This part will be useful to students, but a beginner would have some difficulty in recognising certain genera without any description of the family or order to which they belong. Thus, an "annual or shrubby perennial herb with linear leaves" would do for other plants than the old genus *Odontites*; but, as far as

* *Flowers and Trees of Palestine*, by Augusta A. Temple, with 44 photographic illustrations. Crown 8vo., 172 pages. Elliot Stock.

extreme brevity will allow, the authoress has generally seized upon some characteristic feature in each case. With regard to the four chapters a few observations may be made. Because Arabs to-day use the word "Shûsan" as a general term for flowers of the Lily kind, such as "Tulip, Iris, Anemone, Ranunculus, &c.," therefore references in the Old Testament to "Lilies" "probably signified any or all of these." Surely the authoress does not consider Anemone as of the "Lily" kind? It requires a study of the use of the word "Shûshan," as well as of the Greek "Krinon," to show that the ancient Greeks and Jews were quite familiar with the true Lily, and meant it. *Linum usitatissimum*, not *L. sativum*, is the botanical name for Flax. The "Rose of Jericho" is described as "having leaves like a Lycopodium." The authoress is confounding its habit of rolling up into a ball with the totally different foliage of *Selaginella convoluta*, which also rolls up when dry. The Caper is not now "generally understood to be the Hyssop." There are more reasons for suggesting Thymra. The Date and Castor-oil are not "tropical," but belong to the warmer temperate regions, as of North Africa. Lign Aloes had nothing to do with the modern plant, but is a mistranslation of the Hebrew word for tents, "ahalim." Mignonette is recorded as "wild" south-west of the Dead Sea. We should like to know if this is a fact, and that it is not "naturalised." In speaking of the different plants in the text, the beginner has no clue as to whether any one of them is indigenous or whether it has been introduced. He must refer to the list for such information; in reading these four chapters he would have no reason for suspecting an introduced species. If he has some little preliminary knowledge of the main features of the families or orders, then he will find the descriptions of the genera most helpful. But in order to obtain fuller information he must consult Dr. Post's *Flora*. Thus far, then, the authoress has successfully done what she set out to do, and the little book ought certainly to be a great help to all who really wish to know all that is possible about the plants of Palestine. H.

NEW OR NOTEWORTHY PLANTS.

CRINUM AMÆNUM, ROXBURGH, VAR. MEARSII.

BULB round or rarely oval and slightly tapering towards the apex up to 2 inches in diameter; leaves ensiform rather thin, undulate, 8 inches to 1 foot or more long, 1 inch wide, tapering gradually to a point, very smooth, closely veined, margin entire; peduncle moderately stout, somewhat flattened, a little more than $\frac{1}{4}$ inch broad, 3 to 4 $\frac{1}{2}$ inches long, umbel 6 to 10 flowered, spathe-valves about 2 $\frac{1}{2}$ inches long, thin, pale coloured, about $\frac{5}{8}$ inch broad at base, gradually tapering to a point; filiform processes present round the spathe and between the pedicels; pedicels $\frac{1}{4}$ inch long, perianth hypocateriform, tube slender, white, up to 5 inches long, erect at first, cernuous before the buds open; segments white, lanceolate, spreading, 2 $\frac{1}{2}$ inches long, $\frac{1}{2}$ inch broad, tapering and incurved near the acuminate apex; stamens not quite so long as the segments, the upper half reddish; anthers linear, $\frac{1}{2}$ inch long,

style of the same length as the segments, upper half reddish, stigma with three short lobes. Whole plant when not in flower only 2 to 3 inches high, flowering well in a 60 (3-inch) pot. This variety, of which a plant was exhibited at the Holland House show [see p. 35], was discovered in Upper Burma by Major Arthur Mears in a dry Teak wood forest on hills (2,500

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM SMITHII.

A SPLENDID example of this beautiful hybrid obtained by crossing *O. Rossii rubescens* and *O. crispum* is in flower in the fine collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). This por-

FIG. 22.—CRINUM AMÆNUM VAR. MEARSII. HEIGHT OF PLANT ABOUT 3 INCHES. FLOWERS WHITE.

feet elevation), a little to the north of Mingin. It differs from the type in being a smaller plant with smaller leaves which have glabrous edges; the peduncle also is shorter and flattened. This is probably the only form of *C. amœnum* in cultivation in this country. R. H. Beddome.

tion of the plant displays the unique beauty of its flower even in a more marked degree than was the case in the original specimen which was shown at the Royal Horticultural Society by the raisers, Messrs. Charlesworth & Co., on Dec. 5, 1905, when it obtained a First-

Class Certificate, and was illustrated in the *Gardeners' Chronicle*, Dec. 16, 1905, p. 427.

There is a remarkable combination of colour in its fine showy flower, which on close examination reveals many charming points not possessed by other *Odontoglossums*. The ground colour of the broad sepals is white, with a slight sea-green shade, the margin being deep rose-purple, and the central part bearing distinct, nearly black blotches. The central area of the petals is clear white, and the broad margin rose-purple, the inner white portion having blackish blotches as on the sepals, and both sepals and petals a short, broad and nearly black line radiating from the column. The lip is white at the base, the elongated front bright rose-purple, and the crest yellow.

ODONTIODA VUYLSTEKEÆ KINGSMILLII.

(O. PESCATOREI × C. NOEZLIANA.)

A FLOWER of this beautiful hybrid from the

It is a very attractive and unusual combination of colours, and the tone of these latter varies considerably in different aspects. The collection of *Odontoglossums* and hybrids in the house constructed for them by Mr. J. Gurney Fowler is in splendid health, and the progress the plants have made since the new house was available is satisfactory.

ONCIDIUM MACRANTHUM.

In a row along the centre staging of the largest *Odontoglossum* house in the nurseries of Messrs. J. and A. A. McBean, Cooksbridge, a number of this showy *Oncidium* has been making a fine show for several weeks past, and the plants are in a condition to continue flowering for some time to come. The long spikes are trained around sticks, so that the lateral branches form dense heads of large, yellow flowers, some of them with bronzy-coloured sepals, and all with purple markings on the lip. As each flower

MARITZBURG BOTANIC GARDEN.

THIS garden was established about the year 1874 with the object of determining the most suitable trees for planting in the midland district of Natal. The work, and the distribution of suitable trees has now been taken over by the Natal Government. The Botanic Society therefore devotes its attention to the introduction of herbaceous plants and shrubs suitable for the colony. The tall trees growing around the lake, shown in fig. 23, are examples of *Eucalyptus citriodora*, a species that is valued on account of its lemon-scented foliage. This tree grows rapidly, and forms very tall, unbranched stems, and is in consequence not of much value as a shade plant. Its timber is largely used for studs, which, after 20 years wear, show no decay; the wood is also used largely for making fences, as it splits well, bends very readily, and, above all, is practically

FIG. 23—VIEW OF A LAKE IN THE MARITZBURG BOTANIC GARDEN.

collection of J. Gurney Fowler, Esq., well demonstrated the pleasant side of Orchid hybridisation, as it proves a perfect gem in colour and form. The arrangement of the sepals and petals is perfectly flat; the lip is extended a little in front of the plane of the other segments. The sepals are bright reddish-carmine, with a white, irregular margin tinted with rose. The petals have the middle portions filled with confluent, reddish-carmine lines, the white ground colour showing through at the base and on the outer extension of the colouring, the margin being tinged with rose as in the sepals. The base of the lip is bright orange; the column is tinged with the same colour and marked with red. The crest is yellow, and the extended side lobes of the lip tipped with rose, a reddish rose blotch being in front of the crest. The front of the lip is cream-white, with a slight rose shade.

is between 3 and 4 inches across, the effect is very striking. Very few growers obtain such complete success with this species, and many fail to do anything more than induce it to make a few flowers on a very straggling spike. The trouble generally arises from the plants being kept too warm and dry, and hence the remarks about the simple manner in which Messrs. McBean grow it will be useful. *Oncidium macranthum* and the violet *Odontoglossum Edwardii*, which requires similar treatment, and flowers finely at Cooksbridge, are both grown with the *Odontoglossum crispum* and treated in a similar manner as regards water, &c., their place being the middle row of the central staging in the house. There is, therefore, no reason why all successful growers of *Odontoglossums* should not succeed equally well with *Oncidium macranthum*.

immune from the attacks of the white ant. *Salix babylonica*, the tree seen to the right of the *Eucalyptus*, is a great favourite with the colonists. It has a pendulous habit, such as is not found in any other tree in Natal. It forms a very large specimen, and is easy of cultivation and propagation, for large or small cuttings, root very readily. This species thrives best on the banks of streams. The timber burns readily, even when it is freshly felled. *Acer Negundo* succeeds better in Natal than any other species of Maple. It forms a good shade tree, and is very ornamental, but its timber is valueless. This tree also does well when planted by the water side.

The handsome *Liriodendron tulipifera* (Tulip tree) grows as rapidly as Poplars in this part of Africa, especially when it is planted in deep, alluvial soil. It is perhaps the most successful

deciduous tree in Natal, where, as a rule, deciduous trees do not form good specimens.

A great many examples of *Ceratonia Siliqua* (The Carob) are met with in Natal, but up to the present time the timber of this species has not been put to any commercial use.

Cassia fistula is a deciduous, yellow-flowered species closely resembling a *Laburnum* when

other foliage. The Flame Tree of Australia, *Sterculia acerifolia*, is one of the most ornamental of all shade trees, and when in flower it is draped with crimson blossoms. *Syncarpia laurifolia* (Turpentine tree) is a large Australian species, closely allied to the *Eucalyptus*. Its timber is especially valuable for the making of piles to withstand the action of salt or fresh

dens is *Cedrus deodara*. The colonists are planting this Cedar very extensively in the upland districts of Natal.

Other valuable trees introduced and distributed from this Botanic Garden include *Cedrus atlantica*, *Juniperus bermudiana*, and *J. virginiana*, *Cupressus lusitanica*, *Cryptomeria japonica*, *Sequoia sempervirens*, *Cedrela odorata*, *C. Toona*, *Taxodium distichum*, *Callitris australis*, *Cupressus macrocarpa*, *Eugenia Mini*, *Sapindus longifolius*, *Pinus Pinaster*, *P. insignis*, *Cupressus pyramidalis*, *Casuarina suberosa*, *Podocarpus elongata*, *Platanus orientalis*, *Ailanthus glandulosa*, *Juglans cinerea*, *Ficus elastica*, *Gleditsia triacanthos*, and *Laurus Camphora*. SCHOOL OF HORTICULTURE.*

(See also article on p. 70.)

THE society admits a limited number of young men to study the principles and operations of horticulture in their gardens at Wisley, near Ripley, in Surrey.

CONDITIONS OF ADMISSION.

The following are the principal conditions of admission:—

1. Applicants for admission as working students into the Royal Horticultural Society's gardens at Wisley are furnished with a copy of this paper, which, when signed, must be returned to the secretary, R.H.S., Vincent Square, Westminster, accompanied by a letter in the applicant's own handwriting.
2. Applicants must not exceed 22 years in age, and they must be healthy, free from physical defect, and not so much below average height as to interfere with their prospects as gardeners. They must also be prepared to perform all kinds of gardening work, including the humblest.
3. Two testimonials as to character should accompany the application.
4. The applicant will be informed if his name has been entered for admission, and, on a vacancy occurring, he will receive notice to that effect. Should there be no vacancy within six months, the application must be renewed if admission is still desired. If not renewed, the applicant's name will be removed from the list. The terms begin on the last Monday in September, and the last Monday in March, when only can students be admitted.
5. After any applicant has received notice of his admission, a fee of £5 5s. must be forwarded to the secretary of the society before the order for admission can be issued. This payment covers all charges for two years, with the exception of books, stationery, note books, and such like.
6. No wages are given to students.
7. On appointment the student will have to sign the following agreement to abide by the rules and regulations of the gardens, and to stay not less than two years, the council having full power to terminate the engagement sooner should conditions arise rendering such a course, in their opinion, desirable.
8. Students are required to conform to the following regulations:—

(1) *Obedience*.—Implicit obedience to the director, superintendent, foremen and others appointed as instructors, and to conform to the ordinary rules of the gardens.

(2) *Regularity and Punctuality*.—To observe regularity and punctuality in daily attendance. Hours, 8.45 a.m. to 6 p.m. in summer, and in winter as may be arranged.

(3) *Holidays*.—Each student will be allowed the Bank Holidays, Sundays, Saturday afternoon (from 1 p.m.), and 21 days during the year. The 21 days holiday must be arranged, as to date, with the consent of the director

* Prospectus issued by the Royal Horticultural Society.

[Photograph by F. Mason Good.]

FIG. 24.—A GROUP OF DELPHINIUMS, NOW A FAMILIAR FEATURE IN MOST GARDENS.

seen at a distance in flower. The wood is in common use in India.

Members of the genus *Rhus* succeed well in the Maritzburg district, especially *R. coriaria* and *R. vernicifera*. The latter species yields Japan varnish, and in autumn its leaves show various tints as *Ampelopsis Veitchii* does in England, producing a very pretty effect amongst

water; the species should prove a valuable timber tree for the colony.

Tristania conferta, a large ornamental evergreen tree, will no doubt be largely grown in the future for its timber. The soil of Maritzburg suits this tree, which is exceedingly rapid in its growth.

The most graceful tree to be seen in the gar-

and superintendent, and may be taken either one week's holiday at Easter, or Christmas, and two weeks in August or September; or if preferred, three weeks in August or September.

(4) Students misconducting themselves or breaking these rules will be subject to instant dismissal.

CERTIFICATES.

Certificates of proficiency are granted to each student at the end of the two years' course provided that, in addition to fulfilling the foregoing conditions, he

(1) Pass written and practical examinations in the principles and operations of horticulture upon the syllabus laid down for study.

(2) Present an essay written by himself upon some approved horticultural or scientific subject.

(3) Submit a collection of at least 200 properly dried, named and localised plant specimens collected outside the Wisley Gardens.

(4) Submit a collection of insects either injurious or helpful to horticulture.

One or two student demonstratorships or travelling scholarships will be awarded by the council, at their discretion, after considering the reports of the director, superintendent and examiners, to enable the student to acquire special knowledge of some particular branch of horticulture. Students to whom these awards are made will receive a small remuneration and will be required to assist in demonstrating to the junior students.

COURSES OF INSTRUCTION.

There will be two courses of instruction, an elementary or first year, and an advanced or second year course. Each course will include laboratory instruction in elementary science as applied to horticulture together with field work, and garden instruction in the practical operations of horticulture. Every student will have an opportunity of spending part of his two years in each department of the garden, and the practical work will be supplemented by lectures. Students will have an opportunity of seeing the various trials and experimental work in progress in the garden. Selected students have also the advantage of attending certain of the society's shows and lectures in London.

THE LABORATORY.

The laboratory accommodates 24 students and is well lighted, ventilated and heated.

Lockers are provided for the use of each student so that books and apparatus may be kept under lock and key when not in actual use.

Apparatus.—Each student is provided with all the instruments and materials needful in the practical work of the laboratory (except knives, books and such like). Great care must be taken of these and they must always be left in good condition. Breakages will have to be paid for by the breaker.

Microscopes.—The microscopes provided must be placed in their proper compartments in the microscope cupboard when not in actual use.

Tables.—Students are expected to keep their work tables clean and tidy at all times.

Library.—A library of books useful to horticultural students is available for general use.

THE GARDEN.

The garden consists of about 60 acres of land presented to the society by the late Sir Thomas Hanbury, K.C.V.O., and includes the celebrated wild garden of the late Mr. G. F. Wilson, V.M.H. Several acres of fruit trees have since been planted, and an outdoor vineyard has been started as an experiment; fine collections of flowering shrubs and of Roses have been presented; trials of vegetables and of hardy flowers and plants are continually in progress; and an extensive range of glasshouses, including orchard house, vinery, stove, propagating pits, &c., have been erected, so that all departments of horticulture are represented. Each student also has a small plot allotted to him; and a botanical garden in which plants are systematically arranged according to a natural system of classification is in course of formation. A well-equipped meteorological station is situated in the garden.

SHORT SYLLABUS OF INSTRUCTION.

NOTE.—The following outline syllabuses are not intended to indicate more than broadly the subjects of instruction and do not show the sequence of instruction, as although arranged under different heading as Plant Life, Physics, Chemistry, Soil, &c., the inter-relation between the parts is not indicated and can only be shown in a very full syllabus. Almost everything in the following Syllabus will be studied practically by observation and by experiment.

I.—ELEMENTARY COURSE.

A.—Plant Life. Flowering Plants.

Study of a typical plant.

Study of seeds. Structure, uses of various parts. Conditions of germination. Fate of food stuff stored in seed. Respiration. Testing of seeds.

Roots. Functions of roots. Fixation. Absorption of water and earth salts. Osmosis. Root pressure. Bleeding of wounds. Study of substances absorbed. Water culture experiments. Mode of growth of root. Manner in which it is placed in a position to do its work. Transplanting, &c.

Leaves. Structure. Functions. Transpiration. Source of water and course of current. Conditions affecting transpiration. Reciprocal action of root and foliage. Absorption of carbon dioxide. Influence of light on. Photo synthesis and conditions affecting the making of starch in the leaf.

Buds and stems. Structure of buds. Growth and development of buds. Growth of stems. Conditions affecting growth of stems. Structure and function of various parts. Healing of wounds. Formation of roots from stems. Effect of pruning, ringing, notching, bending, &c. Grafting and budding. Climbing plants.

Storage of food and water. Parts of plant used for vegetative reproduction. Tubers, corms, runners, &c.

Flowers. Uses of various parts. Pollination. Cross pollination natural and artificial. Fertilisation. Formation of seeds.

Fruits. Structure of common fruits. Seed saving.

Study of plant relationships. The more common orders of flowering plants.

Field study of the influence of environment on plant growth. The vegetation typical of certain soils, and so on. Plant societies. Use of a flora.

B.—Physics and Chemistry.

Heat and temperature. Expansion and contraction thermometers. Changes of state in matter. Conduction. Radiation and absorption. Chemical changes.

Light. Chemical change under. Passage through prism.

Air. Its physical properties (barometers). Nitrogen, oxygen, carbonic acid gas, water vapour in air (hygrometer).

Water. Chemical composition of. Physical properties. Hard and soft water. Solution and solubility.

Acids, alkalis, and salts.

Carbon and some of its compounds. Carbon monoxide and dioxide, carbonates. Carbon in vegetable and animal matter. Fats and oils, starch, sugar, gluten, and albumen.

C.—Soil.

The origin and composition of soils. Mechanical analysis of soils of various kinds, loams, peats, sands, clays, &c. Physical properties of the constituents, capacity for water, &c., clay, sand, lime, humus. Soluble and insoluble constituents. Action of acid solutions, &c. Relation of plant to soil. Recognition of some of the more important salts in soils.

II.—ADVANCED COURSE.

A.—Plant Life.

A more advanced treatment of certain subjects in the elementary course, particularly with reference to plant physiology and composition, and classification. Life history and mode of life of Ferns. Study of fungi, particularly in relation to plant diseases. Geographical distribution of plants. Origin of races, varieties, &c., hybridisation, selection and fixing of varieties.

B.—Insect Life, &c.

Insects, with special reference to those injurious and helpful to plants. Life histories and habits. Treatment to destroy insect pests, mites, centipedes and millepedes, woodlice, eelworms, earthworms, snails and slugs, &c.

C.—Soils.

Further study of soil physics. "Heavy" and "light" soils. Action of lime on soils, &c. Humus—origin of, and effect on texture of soils. Water in soils. Temperature of soils and source of heat in soils, hotbeds, &c.

Chemistry of soils. Sand, clay, lime, humus. Weathering of soils. Life in the soil. Results of decay. Nitrification and denitrification. Minerals in soil. Fertility of soil. Rotation of crops. Manuring. Changes due to tillage, &c. Source and composition of artificial manures and their effect on plant growth.

D.—Economic Botany. (Lectures on.)

III.—OPERATIONS OF HORTICULTURE.

The garden affords ample opportunities for instruction in all the practical operations of horticulture both outdoors and under glass and actual work will be done by the students (who will spend the greater part of their time in the garden according to the accompanying timetable) in all the departments. Experiments in the use of insecticides and fungicides will be carried out.

The practical work will be supplemented by lectures and revision in the class-room and by friendly debates and discussions between the students themselves under the chairmanship of the director or superintendent or other capable person.

TIME TABLE FOR STUDENTS.

		MORNING.		AFTERNOON.		EVENING.	
		8.45—10.	10—1.	1—2.	2—5.	6.30—8.	
Monday	1st Year 2nd Year	Attend to Watering, &c.	Garden Work. Garden Work.	Dinner Hour.	Garden Work. Science.		
Tuesday	1st Year 2nd Year		Science. Garden Work or Show.		Garden Work. Garden Work or Show.		
Wednesday	1st Year 2nd Year		Garden Work. Garden Work.		Garden Work. Science.		Paper by Student and Discussion.
Thursday	1st Year 2nd Year		Science. Garden Work.		Garden Work. *Garden Work and Revision.		
Friday	1st Year 2nd Year		*Garden Work and Revision. Garden Work.		Garden Work. Science.		
Saturday	1st Year 2nd Year		Science. Garden Work.		Holiday.		

* Garden Work 1 hour. Revision 2 hours.

COLONIAL NOTES.

A PLAGUE OF LOCUSTS.

GARDENERS in this country experience much trouble with numerous plant-pests, but they are fortunately exempt from the plague of locusts so common in Africa and other tropical countries. Locusts often attack the vegetation in such immense numbers that they eat almost everything in their path. Our illustration at fig. 25 is kindly sent us by Mr. Stirrat from Johannesburg, and it affords some conception of what an invading host of these creatures appears like. Mr. Stirrat writes as follows:—

"It is disheartening, after one of the finest growing seasons this locality has experienced for several years past, to see the result of one's labours destroyed by millions upon millions of locusts, which have recently visited the Rand and spared scarcely any vegetation in their path.

"In the various parks under my control thousands of winter-bedding plants, some two months planted, have been eaten. The grass lawns are now in such a condition that the casual visitor can scarcely determine between the paths and the flower-beds. Every precaution was taken to keep these destructive creatures at bay, but without any apparent effect.

"It is hopeless to attempt to kill the locusts in their adult condition, and effective measures can only be instituted when they are in the wingless stage, when various arsenical sprays can be used with beneficial results.

"The photograph was taken in one of our parks in the centre of the city, and it conveys a very inadequate conception of the numbers of the pest present. One's sympathies are with the farmers, many of whom, living quite close to Johannesburg, have been practically ruined by this pest." *A. H. Stirrat, Superintendent of Parks and Cemeteries, Johannesburg, May 27.*

FRUIT CROPS OF THE SEASON.

GREEN Gooseberries, now all marketed, were a great crop with me, but were sold at unremunerative prices. Even when only about half their full size, they made no more than 3s. 6d. per half-sieve of 24lb. When about three-quarters grown, half-sieves of 28lb. made only 2s. 6d. in London, and the rail carriage was 5½d., commission 3d., and portorage 1d., making 9½d. for expenses, besides 4d. for picking. A little later the price was 2s. in London, with the same expenses to deduct, leaving me 10½d. for ¼ cwt. of Gooseberries. Finally, the price fell to 1s. 9d., leaving me 7½d., after paying for picking, or 7d., if I charge for carting to the station. The sample was not first-rate, it is true, as the bushes on the largest piece of land are young, but they were greatly over-cropped for their size. Although thinned once, they did not produce berries of the full size, partly because there was no summer heat to help them, and partly on account of the fruit being very thick, even after half had been taken off. But the top quotation was only 3d. more than I received, and 8s. per cwt. cannot be regarded as a very remunerative gross return for Gooseberries, even in the latter part of their season.

Black Currants are now ready. They are thick on the bushes, but do not look like swelling to the proper size, and, probably owing to the cold and sunless weather, they are ripening irregularly. Red Currants, grown only for home use, are a tremendous crop. Strawberries are nearly a failure here, but the soil does not suit them, and they are not grown for market. Raspberries, which the soil does suit, show great promise.

Cherries are moderately thick on the trees, but are small. For the first time I have "brown rot" on Cherries, one of the many bad results of this miserably cold and wet season.

Plums, in my plantation, are abundant on the whole, but a good many have turned red and are dropping. Early Rivers and Monarch show

moderate crops, while the variety Victoria is overloaded with fruit, and Czar and Gisborne have great crops on them. Pond's Seedling alone has "stoned" badly. With me it is the weakest grower, and the most infested by aphids. Even Coe's Golden Drop has a moderate crop, and Old Greengage a small one. Black Diamond, grown only in my

and burnt. This new victim, although a fine tree, will share the same fate as soon as the fruit has been taken from it. The Damson crop with me is a good one.

The Apple crop, in spite of the profuse blossoming of the trees, is not far short of a failure, not only in my plantations, but throughout my district also. This may probably be attributed

FIG. 25.—A PLAGUE OF LOCUSTS IN A JOHANNESBURG GARDEN.

private orchard, has only half a crop, while Deniston's Superb Gage bears a good one, and Reine Claude Violette hardly any. I have a little "brown rot" in Plums for the first time. A tree of the variety Victoria is noticeable as attacked by "silverleaf," but yet bearing a good crop of Plums. All similarly-affected trees that were noticeable last season were dug up

to two causes—the first, the cold and wet period of blossoming; and the second, the over-production of last season. Some varieties which fruited heavily last year have hardly any Apples upon them. These include Domino, Lord Grosvenor, Lady Sudeley, Blenheim Pippin, Stirling Castle, and Allington. The last two have never before failed to bear good crops. Potts's

Seedling did not bear well last year, and this season it is almost entirely fruitless. Next to King of the Pippins and Ribston it is the most cankered variety that I grow. Lane's Prince Albert bears half a crop, and Queen, Bramley's Seedling, and Royal Jubilee about the same. Newton Wonder is somewhat more fruitful. The only fair crops here are those of the variety last-named, Early Julyan (on some trees only), Mr. Gladstone, Irish Peach, Beauty of Bath, and Duchess of Oldenberg. King of the Pippins has barely half a crop.

The deficient yield, unfortunately, is not the only trouble, for the bulk of the fruit is dwarfed, and much of it is scabby, while there is the worst attack of the Sawfly maggot that my trees have suffered. The dwarfing of much of the fruit is due to a persistent attack of the pestilent aphid, which smothers the foliage of nearly every truss of fruit. Last season I sprayed three times with quassia and soft soap, but failed to materially check the aphid attack. This season I was not disposed to spend money for nothing

Plums also will flourish there. But a little scab is to be seen on Cox's Orange Pippin in a young plantation on heavier land, where other varieties are free from the disease, and this is discouraging, as the variety is the one which, above all others, it is desirable to be able to grow.

To return for a moment to the aphid attack, in order to notice an experiment which should have been mentioned above, a large fruit-grower here has dusted his infested trees with lime and sulphur in equal proportions, reporting favourably upon the result. Accordingly, I tried the remedy on a dozen badly-infested trees, doing them thoroughly. Two days later they were carefully examined, and there was the conflict of evidence which is so annoyingly common when the results of experiments for the destruction of pests are searched for. On some leaves well covered with the dust the aphides were dead, only their dry skins being left, while on others they were as full of life as ever. Moreover, on trees not dusted, leaves were found with only aphid skins upon them. Clearly, then,

[Photograph by C. P. Raffill.]

FIG. 26.—LILIIUM BROWNII FLOWERING IN A BED OF HEATHER AT KEW.

in spraying specially for this pest, but trusted to the Bordeaux mixture, applied to check scab, as, when hot sunshine follows its application, this wash has a drying effect which is fatal to the green fly to a great extent. As for fungus pests, scab and brown rot are more extensive even than they were last season. Cox's Orange Pippin is affected with scab so badly that the crop is quite ruined, while nearly all the leaves have fallen off the trees, and Bismarck is nearly as bad. It is obvious that neither variety will flourish in my lightest soil. Very severe cutting back—to the main branches—and drenching with sulphate of iron in the autumn, and with Bordeaux mixture in the following season, will be tried, in order to see if a new and more vigorous growth will result. But Plums will be planted between the Apples, so that they can replace them if the latter do not recover. Strange to say, Damsons grow with the greatest vigour where Apples fail, and, therefore, it may be hoped that

no certain conclusion was to be derived from the evidence of the dusted trees. But I was not at the end of my resources. I placed some leaves covered with aphides in a small box, and smothered them with lime and sulphur dust. Two days later they were examined, and the great majority of the aphides were fully alive, struggling with the dust which enveloped them. This satisfied me as to the failure of lime and sulphur to destroy the aphid.

Pears, which blossomed with the utmost profusion, have set very badly as a rule. The only varieties bearing fairly here are Louise Bonne of Jersey, Doyenné du Comice, and Jersey Gratioli. Clapp's Favourite has half a crop, and Williams' Bon Chrétien a smaller one; but most other sorts are nearly barren. A tree of Catillac, which was about as densely covered with blossom as it could possibly be, bears one Pear, while Marie Louise has no fruit at all. A *Working Grower*.

LILIIUM BROWNII AT KEW.

WE are sometimes asked for information in regard to the planting of Liliums, such correspondents appearing in doubt as to the conditions of soil and position that are most suitable for their cultivation. In the Royal Gardens, Kew, there may be seen at the present time plenty of illustrations of Liliums growing and flowering well in Rhododendron beds and in other beds that are planted with various species of Erica. In the preparation of beds for these plants it is usual to employ a proportion of peat, which is mixed with the staple soil, or with loam procured for the purpose, and such a compost is well adapted for the cultivation of Liliums. But, furthermore, the bulbous plants appear to be favoured by the surface of the ground being more or less shaded from the rays of the sun by the Rhododendron bushes, or dwarfed-heather. It should be pointed out, however, that in order that the effect may be good when the Liliums flower, the bulbs should only be planted amongst Rhododendrons of such stature that the Liliums will be able to develop their flowers well above the tops of the shrubs. It may be necessary to lift the bulbs after several years have elapsed, and re-plant them amongst Rhododendrons of a lesser size. It is no disadvantage that the lower portion of the Lilium stems is hidden from view, but in some cases, as in that of the elegant species *L. testaceum*, which is apt to become shabby of foliage, it is a distinct advantage. Mr. Raffill's photograph, which is reproduced at fig. 26, shows the species *L. Brownii* flowering abundantly in a bed of heather. The flowers of *L. Brownii* are white, with brownish-purple on the outer surface of the petals.

THE PROPAGATOR.

TREATMENT OF CUTTINGS.

THESE should be taken from perfectly healthy plants, and made with a very sharp knife, and preferably a penknife having a fine, thin blade, so that the cuts may be smooth. Cuttings of plants which put forth roots from the surface of the cut should be severed just beneath a bud or joint, and in a horizontal direction. The formation of roots is preceded by that of a callus—a spongy tissue which forms between the bark or rind and the inner tissue, and from out of which the roots emerge. The formation of a callus indicates the certainty, barring accidents, of the development of the cutting into a plant; and the healthier the plant of which the cutting formed a part, the more quickly does callus-development proceed. In the case of plants which have two periods of growth in a year, the cuttings are best when taken from the first growth of shoots; and by those which grow continuously the cuttings should be selected from shoots whose rind has begun to change colour. Cuttings which root from any part of the rind need not be cut at a joint, and such cuttings will form roots even when laid on the propagating bed, if the warmth be sufficient. Cuttings of soft-wooded plants should be cut at the base horizontally, just below an eye or a bud, in order to make certain of their rooting. Do not allow cuttings to remain out of the soil long enough for the cut surface to become dry, unless the plants have milky sap, as in the case of *Ficus*, *Euphorbia*, &c., but put them into the cutting-pots, pans, or the sandbed forthwith, making them firm therein and affording a slight application of water. If one cutting per pot be the method in use for certain species, the pots should have no greater internal diameter than 1½ inches, the cutting being placed in the centre. Always make use of a dibber of a suitable size to make holes for the cuttings, as forcing a cutting into the sand or soil is sure to cause injury to the rind at the base. Do not cover any cuttings with a bell-glass before the leaves are dry, and do not insert cuttings of divers species of plants under the same bell-glass, for the rooting often occurs at different times. Cuttings which emit roots from the surface or exterior of the rind may be inserted deeper than those which form roots from the base. In the case of plants with milky sap, the cuttings should be trimmed and afterwards be placed head downwards in moistened soil, keeping them therein for 24 hours or longer time (*Euphorbias* of some species for a month) till the sap dries on the wounds

made; afterwards wash the base with a wet sponge to remove the dried juices, an act that favours the rooting process.

In the present month, cuttings of Tea, Noisette, Hybrid Tea, China or Monthly, and Bengal Roses may be rooted in frames placed on mild hotbeds of tree-leaves and stable litter, sweetened by three turnings and mixings previously to making the beds. If the bed be made of a thickness of 2½ feet, sufficient warmth will be afforded for rooting the cuttings within four or five weeks. (See pages 5 and 6, July 7 last year, for full directions as to carrying out the propagating of Roses from cuttings.) Most of the Roses mentioned above do well on their own roots, and are seldom injured severely by frost, whereas budded Roses suffer from this cause in hard winters when the snowfall is very light or is absent. Budding of dwarf Roses is the nurseryman's plan of raising a large number of plants, but the amateur and gardener has seldom any motive to employ it for the class of Roses named.

DECORATIVE PLANTS FOR THE FLOWER-GARDEN.

From the middle of July to the middle of August is the most suitable period for the propagation of the following plants, either several together in store pots of 6-8 inches inside measurement, or singly in 60's:—*Alternanthera Angelonia*, *Anthemis*, *Bouvardia*, *Cineraria*, *Chelone*, *Gazania*, *Gnaphalium*, *Fuschia* (for early flowering in pots in the greenhouse), *Heliotrope*, *Lantana*, *Pelargoniums*, including Cape, fancy, decorative, zonal, Ivy-leaved, and the scented-leaved varieties and species; *Pentstemon*, *Petunia*, *Phlox*, *Phygellus capensis*, *Iresine*, *Salvia*, *Senecio*, *Solanum*, *Tropæolum*, *Verbena*, *Lobelia erinus* varieties, *Cuphea*, *Ageratum*, *Coleus*, *Ferdinanda*, *Ficus*, and *Dracæna*.

Most of the foregoing plants require to be merely afforded frame protection, and to be kept close and shaded from sunshine, with moderate applications of water and a sprinkling overhead, about 4 p.m. on hot days. Damping off can be avoided by an early removal of the lights each morning, if the weather be fine.

The sub-tropical and tender species root the more readily if slight bottom heat can be applied. *Pelargoniums* of the Cape, fancy, Odier, and decorative sections, strike freely from cuttings of ripened shoots, inserted singly in small 60's, or to the number of four to six in 48's, and *Zonals* root freely in sandy soil in beds in the open air in full sunshine.

They may likewise be rooted in cutting-boxes, each holding 1½-2 dozen cuttings, if wintering space be limited. Fine varieties of *Phlox decussata*, *P. Drummondii*, and double-flowered *Senecio elegans*, which may not be obtained true from seeds, may be struck from cuttings of the short shoots taken from near to the base of the plants, which are the more suitable for rooting than shoots growing on the upper parts of the plants. They should be cut close under a joint, and if they are put into a bed enriched with leaf-soil, and afforded a layer of sharp sand on the surface, shaded with reed or other mats from hot sunshine, and the soil kept moderately moist, success is tolerably certain to follow. An ordinary garden frame is also a suitable aid in rooting these cuttings.

KENNEDYA.

This plant may be increased by means of cuttings at this season, if afforded a bottom heat of 60°-65° and a moderate degree of moisture. The short shoots coming from the stems form the most suitable cuttings. They should be covered with a bell-glass.

LAYERING.

There are numerous plants which root with difficulty by the cutting method, and that make roots readily when layered. The shoots should have reached a certain degree of maturity, which, with some subjects occurs in the month of June. The following is a list of common garden plants which should be propagated by layering:—*Amorpha*, *Azalea*, *Berberis*, *Bignonia*, *Calycanthus*, *Ceanothus*, *Cercis*, *Clematis*, *Cornus*, *Deutzia*, *Euonymus*, *Æsculus macrostachya*, *Laurus*, *Magnolia*, *Ornus*, *Pæonia*, *Rhododendron*, *Rhus*, *Ribes*, *Spiræa*, such as *S. lævigata*, and some of the *Viburnums*. *F. M.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Oncidium leucochilum is a useful subject for providing a supply of cut flowers, and for decorative effect in the plant houses. For several seasons past plants of this species have formed a prominent feature in one of the cool intermediate houses at Burford; they have developed flower-spikes from 5 to more than 6 feet in length, and branched almost from the base, each spike carrying a large number of white-lipped flowers. They remain in flower for at least a month. After the inflorescences are removed, the plants should be placed at the cool end of the house, and be given plenty of fresh air. In some cases, owing to the strain of carrying such large flower-spikes, the pseudobulbs shrivel considerably, and it is only with care that the plants are brought to their normal condition again. Instead of affording water in large quantities with the object of making the bulbs plump, the safer plan is to damp the growths lightly overhead with a fine spray two or three times each day until growth recommences. At the same time, the plants' surroundings must be kept in a fairly moist condition. Repotting should be done soon after growth has started. The plants at Burford are potted in a compost consisting of equal parts fibrous peat and leaf soil, with a moderate quantity of chopped sphagnum-moss and small crocks. When grown in this material, the plants require repotting annually. Place a few crocks over the bottom of the pot, and repot them in a similar manner as an ordinary garden plant is potted. Fill the pots with the compost to within half an inch of the rim, and finish with a surfacing of living sphagnum-moss, which should be placed quite firmly around the base of the plant. Such *Oncidiums* as *O. concolor*, *O. Forbesii*, *O. crispum*, *O. prætextum*, *O. varicosum*, *O. ramosum*, &c., which have started into growth, should also be repotted in the same material. These are all cooler growing species, and they thrive best in the *Odontoglossum* house. Orchids that are grown in this mixture should never be thoroughly saturated with water at their roots, and moisture sufficient only to keep the sphagnum in a fresh condition must be given them. Use a fine rose when watering. *O. macranthum* is now in bloom. When in flower this plant should be given a maximum supply of water at its roots, and more than at any other period.

Dwarf-habited Odontoglossums, including *Odontoglossum cordatum*, *O. maculatum*, *O. Cerdstedii*, *O. aspersum*, *O. Humeum*, and *O. Duvivierianum*, can be accommodated very well in shallow pans suspended from the roof. They succeed in the same compost as advised for the *Oncidiums*.

Lælia harpophylla may also be repotted now, in a mixture of peat and moss, with ample material for drainage. Throughout the summer keep this plant in the cool intermediate house.

Platyclinis filiformis is sending up numerous thread-like flower-spikes. Suspend the plant in a light, moist position in the intermediate house, and afford it plenty of moisture overhead from a fine sprayer until the flowers begin to open, after which any water must be applied without wetting the flowers. *P. glumacea*, *P. Cobbiana*, and *P. uncatata* all thrive well under the same conditions of temperature. They are now at their resting season, but they still require sufficient moisture to preserve the small bulbs and leaves in a plump condition. Spray the under surfaces of the leaves occasionally, in order to keep insect pests in check.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. Thomson Paton, Esq., Norwood, Alloa, Clackmannanshire.

Pine Apples.—Plants which are now showing their fruit may be given liquid manure at every watering, but care must be taken to supply this at the exact time it is needed. They should also be given a top-dressing of horse droppings, mixed with an equal quantity of finely-broken, rich loam. Keep the atmosphere of the house moist by damping down two or three times a day. Close the pit early in the afternoon that the temperature may

rise with sun-heat to 95° or 100°. The weather being warmer, very little fire heat will be required in the pits during its continuance, except that the supply of bottom heat must be maintained. Fine sprayings over the plants with the syringe on bright, warm afternoons are advisable, but care should be taken to avoid unduly wetting the crowns. The structure containing fruits now developing colour should be freely ventilated on warm days, keeping the atmosphere somewhat dry at all times. Such plants require no more water at the roots than is sufficient to keep the leaves in a condition of health. Plants bearing fruits already ripe should be removed to a cool, well-ventilated fruit room.

Successional Pines.—Plants which will fruit next summer should be well established in their fruiting pots by the end of the next month. They must not be kept growing until late in the autumn. Do not let them suffer from dryness at the roots, but be just as careful not to over-water them. All that they require is sufficient water to prevent flagging.

Vines which were raised from "eyes" last spring, and planted out into new borders in June, should be making a short-jointed, steady growth. If they are showing signs of becoming excessively strong in growth, pinch the leading shoot at 5 feet from the ground, but if such is not the case, do not pinch the shoot until it has reached the top of trellis or rafters. Those pinched at 5 feet from the ground must again be stopped at top of trellis. All lateral growths upon very strong-growing canes may be pinched at the first leaf; in the case of weaker Vines no pinching is required, but the tying in of the shoots is very necessary. Allowing this freedom of growth encourages root action, and this is exactly what weak Vines require. Test the borders, and if the soil is dry, afford tepid water. Damp down the surfaces in the house every night and morning. An atmospheric temperature of 70° at night, and 80° to 90° by day will be sufficient. Reduce the ventilation early in the afternoon, and leave the top and bottom ventilators partly open throughout the night. Use as little fire heat as possible. Keep a sharp look-out for red spider, and, if it is discovered, syringe the Vines every afternoon.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq., Cobham Park, Surrey.

Early Celery is now large enough for earthing-up, but before doing this see that the plants are in a moist condition at their roots and that the top growths are thoroughly dry. Earth applied about the stems when the latter are wet will set up damping in the plants. The whole practice of earthing-up is most important, for the crop is liable to be ruined if the work is performed in a careless manner. The tying of the stems previous to earthing-up the plants is not so generally practised as formerly, but if this is done, care must be taken that they are not tied tightly, so as to prevent the inner leaves from developing. If tying is dispensed with, place the leaves in their proper position, and grasp them with the left hand, and with the right draw the soil well up and around the plant, at the same time pressing it well. After each plant has been treated in this manner, fill up the trench with soil to the level of that placed about the plants by the hand. Earthing-up should be done gradually and at intervals of about 10 days, but the progress of the plants should be the best guide as to when more soil is necessary.

Celeriac on light soils must be given frequent waterings. Remove the short, outer leaves, or any side shoots that may appear, also any unnecessary roots that develop towards the base of the stem. Do this work at intervals of from three weeks to a month.

Carrots.—A sowing of such early varieties as *Early French Horn*, or *Early Gem*, should now be made on a warm border, or in a partially protected position. The roots will be most useful in late winter and early spring, especially in places where young Carrots are in demand and frames are not available for their sowing. Select a spot for the sowing so that the plants can receive the protection of some dry leaves, later on, without causing an untidy appearance in the garden. These Carrots should be left in the ground until they are required for use.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq.,
Eastwell Park, Kent.

Souvenir de la Malmaison Carnations.—As the plants pass out of bloom, no time should be lost in making preparations for carrying out the operation of layering, in order that there may be sufficient time afterwards for the layers to become strong and well-established before the commencement of winter. Select only strong, healthy plants for use in layering, it being likely that the employment of weak and unhealthy plants for this purpose is partly responsible for the deterioration seen in some stocks. A frame is undoubtedly the best place in which to layer the plants, for in such a place they can be protected from heavy rains, which are injurious if they keep the roots in a condition of more or less saturation. In frames, the grower can use his discretion as to whether the lights should be used or not at any particular time, but by no means should he keep the frames closed. Our usual practice here is to layer the plants in the frames lately occupied by Potatoes. The soil which was used for that crop may be made quite suitable by adding a quantity of gritty matter or sand, mixed with some leaf-soil, this fresh material being placed immediately around the plant for the young roots to work into. Let the old plants be thoroughly watered before planting them. As the work proceeds, water the plants overhead slightly, and, in bright weather, such as is usually experienced at this time of the year, afford a slight degree of shade for a few weeks; but admit air freely at all times. When the young layers show signs of growth, provided the weather is fine, withdraw the lights altogether in the evening, thus allowing the plants to have the full benefit of the night dews.

Gesneras.—The portion of the stock required to bloom early in the winter should now be shaken out of the pots, and, after repotting the tubers, be placed in a warm house or stove. Use a compost consisting of turfy loam, peat, and leaf-soil in equal parts, with sand and charcoal added to keep the whole porous. Be careful not to use pots of a larger size than is necessary. *Gesneras* succeed well in pots measuring from 3 to 4½ inches in diameter. If large specimens are required, the strongest plants may be selected when they have made a good start for the purpose of placing several together in pans or pots of such sizes as may be required for the special purpose in view. The tubers require very little water at first, the atmospheric moisture being sufficient to start them into growth. Afford water carefully as growth increases, but at no stage do these plants require large quantities. Arrange the plants thinly on the stage to allow the leaves proper room to develop, and shade the plants rather heavily during hot sunshine. As the flower-spikes develop, a small, neat stake will be necessary to keep each plant in position. When the plants are in bloom, reduce the atmospheric moisture, but do not have a lower atmospheric temperature than 57° to 60° at night at that period, allowing a rise of 10° in the day.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bilton,
East Devon.

Strawberries.—If the ground for the planting of new beds is not yet prepared, it should at once be trenched, or double-dug. A moderate amount of good manure should be incorporated between the two spits, and the ground should be made firm by treading before planting. Well-rooted runners may be planted at once, a suitable distance being 1 foot apart in the rows, the latter being separated by a distance of 2 feet. Next season, after the fruits have been gathered, every alternate plant in the rows should be removed; this will afford a space of 2 feet between the plants every way. Give the young plants a good watering in their pots an hour or more previous to planting them in the rows. Make the soil about them firm with the feet, and form a small hollow in the soil around each plant, so that water can be conveniently applied to the roots. In the case of the variety *Royal Sovereign*, allow a further 6 inches of space both in and between the rows, on account of the wealth of foliage which this variety produces on most soils.

As soon as the fruit has been cleared from the established beds, trim off the rough bottom leaves, sever any runners with the knife, and remove all rubbish and litter from the rows. When this has been done, stir the surface of the soil with the flat hoe to destroy weeds, and to lighten the ground which has become hard and consolidated from persons walking in the rows to gather the fruit. Plants that were forced, and afterwards planted out in May or June, must not be allowed to develop a further crop of fruits this season. All flower-spikes must be removed as soon as they appear, and any runners be destroyed, so that the plants may build up strong crowns for next year's fruiting.

The Fig.—With the beneficial change in the weather these trees have made rapid growth, and the new shoots will need securing to the wall or trellis so that the fruits may be exposed as much as possible to the sunshine. Continue to apply copious waterings to trees carrying heavy crops, which appear to be general this season. Stop any shoots not required for the extension of the trees, and rub off superfluous growths on the fruiting wood, as well as any on the older branches that are not required.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow,
Cornwall.

Watering plants in the open.—It is a matter of controversy as to whether the morning or the evening is the better time for affording water to plants in the open. My practice is to select the late afternoon and evening for this work, providing the nights are warm, but if the night temperature is low, the watering is done during the mornings. This work should not be commenced too early in the afternoons, nor continued too late in the mornings, or the foliage will be liable to scorching by the sun's rays, and it is wise to cease the work sufficiently early in the evenings to allow the plants and their surroundings to become moderately dry before night time arrives. One thorough soaking is better than several light waterings, which occasionally do more harm than good. If the surface soil is stirred, either with the Dutch hoe or with a light rake, soon after the watering is done, evaporation will be largely checked, and the effects of the watering will be more lasting. If circumstances do not permit of much watering being done, frequent hoeing of the surface soil and application of mulchings will be found good substitutes. Providing that they are not allowed to suffer from drought, *Pelargoniums* and similar bedding plants, once they have become established, will give a better display if they are not watered. Many other subjects, however, including *Lobelia cardinalis*, *Cannas*, and most large or ornamental-foliaged sub-tropical plants, must be freely watered during dry weather. Trees and shrubs which were planted late in the spring should now be drawing plenty of moisture from the soil, and may generally be left to themselves, but should any appear to be suffering from lack of moisture, they must be copiously watered, have a mulching of manure placed over their roots, and be syringed towards the close of hot afternoons. After a period of three weeks or more from this date a moderate dryness at the roots will be beneficial to shrubs.

Flower-beds.—If the beds are surrounded by grass, their edges must be frequently clipped. All dead or disfigured leaves, faded flowers, and seed pods must be removed, and all flower-buds on plants which are grown solely for their foliage must be destroyed. The plants forming bands or borderings to the beds must be restricted to a suitable size, and the growths of trailing subjects pegged down. When these latter plants have filled their allotted spaces, they should have some of their side shoots removed in order to promote a sturdy habit of growth. This is especially necessary in the case of *Verbenas*, for when the foliage of these plants becomes crowded, the dreaded mildew soon makes its appearance on them.

PUBLIC PARKS AND GARDENS.

By W. W. PERTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Preparations for spring bedding.—The season has now arrived, when, as a rule, in most parks arrangements are being made for next year's spring bedding, and the orders for the various

bulbs required are placed with the successful contractors, ready for execution in the autumn. In many parks spring bedding schemes are conceived on a very elaborate and extensive scale, and, as a consequence, large sums of money are needed for the provision of the material—especially bulbs—necessary for carrying them into effect. Until within recent years *Hyacinths* and *Tulips* were the two plants most used for this work, and as a result spring bedding, although brilliant and striking, was characterised by monotony and stiffness. Latterly it has become customary to utilise many different kinds of bulbous plants in addition to numerous other spring flowering plants. Park officials are realising more and more that the use of *Hyacinths* and *Tulips* in large quantities is not only extravagant, but in many instances gives less satisfactory results than may be obtained by the use of cheaper home-grown material.

Other plants.—We find that *Hyacinths* and *Tulips* are so easily damaged by wind and rain, and their period of blooming is of such brief duration, that preference is naturally given to more suitable subjects such as *Aubrietias*, *Polyanthus*, *Primroses*, *Double Arabis*, *Myosotis*, *Violas*, *Alyssum*, *Double Daisies*, &c. These have all a long period of flowering, and are, as a rule, little injured by the effects of the weather, while in addition they are exceedingly cheap, being easily propagated in great quantities by means of seeds, cuttings, or division.

Wallflowers, when they succeed, are delightful objects in the spring garden, both on account of their colour and perfume. We find them, however, so susceptible to injury from frost or excessive winter rains that they are quite unreliable for taking a place in any colour arrangement, and are better adapted for the general spring border than for a design.

Aubrietias, *Arabis*, and *Alyssum* are best raised from cuttings taken each year just as the old plants finish flowering. Although *Aubrietias* are invariably increased by division, it can hardly be denied that cuttings give the larger and better coloured flowers. *Polyanthus*, when required in special shades of colour, have to be propagated by division, but are hardly fit for use until the second year. With the exception of the *Violas*, most of the ordinary spring-flowering plants are raised from seed.

AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS.—The June number of the *Bulletin* of this society just to hand contains a great amount of information upon public park matters, which is interesting and suggestive reading to all who are engaged in park work. The *Bulletin* is in the first instance type-written, and is passed on from member to member throughout the States, most of whom before passing it on give their views upon, or state their experience regarding, the subject under discussion. In this way every matter taken up is dealt with in the broadest possible manner, and regarded from a great variety of standpoints. In the present issue the most important questions considered are "The Construction of Roads, Paths, and Drives," "Evergreens for Parks," and "Fertilisers." On reading through the various articles, one cannot fail to notice many differences in the practices adopted on this and the other side of the Atlantic. For instance, the use of sawdust as a mulch, or sand as a fertiliser, and a gasoline heater as a weed-killer, all appear strange to British cultivators. Copies of the *Bulletin* can be had for a very small sum from the secretary of the association, Mr. F. L. Mulford, Superintendent of Parks, Harrisburg, Pa., U.S.A.

THE SUPERINTENDENCY OF HYDE PARK.—We learn that the late Mr. Jordan's successor in the post of superintendent of Hyde Park and some other open spaces is Mr. J. A. Gardiner, who has held the important position of superintendent at Hampton Court Palace Gardens and Parks for the past 11 years. During that period quite a revolution in the garden decoration and summer bedding has been wrought, and in many directions improvements have been made. Mr. Gardiner came to Hampton Court from Greenwich Park. He is by seniority entitled to the promotion. His successor at Hampton Court will be Mr. Marlow, who is now at Greenwich Park, and was at one time foreman in the Park where he will now be the head

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Science
at
Wisley.

Friday in last week is likely to be regarded in the future as a red-letter day in the history of the Royal Horticultural Society. On that day there was formally inaugurated a scheme by which it is hoped much will be done to compensate for the many years during which the Society has not been able to assist in the important work of scientific research. Its earlier history is marked by the invaluable services rendered to horticulture in the introduction of new species of plants to this country through the indefatigable collectors the Society sent into distant parts of the world. Their names, which include those of David Douglas, Robert Fortune, and others, have been enumerated in these pages again and again, and they will always deserve to be remembered with appreciation. During the long period the Society held the Chiswick gardens under a lease from the Duke of Devonshire it promoted important exhibitions and conferences; it also conducted trials of varieties of fruits, flowers, and vegetables, all of which were of greater or less interest, and most of them were of some permanent value to cultivators.

The period during which the Society was at South Kensington so impoverished its funds that for many years afterwards a policy of severe retrenchment was enforced upon those charged with the management, and in no direction was this felt more acutely than in the management of the Chiswick gardens, which, in spite of their glorious traditions, were permitted to deteriorate so greatly that they became almost an object of contempt.

In such circumstances, there is little wonder the Society felt itself unable to undertake fresh work which would be certain to impose additional financial obligations. As was pointed out by several of the speakers at Friday's ceremony, the conditions which obtained at the time when Sir Trevor Lawrence was appointed president were anything but satisfactory. The years which intervened between that period and the celebration of the centenary of the Society in 1904 were devoted to husbanding its resources and increasing its membership and prestige. In the meantime the need for facilities for the prosecution of research work became recognised more clearly, and it was expressed so frequently and persistently in these pages that it may sometimes have appeared monotonous by its reiteration. The gift of the Wisley Gardens to the Society in 1904 by the late Sir Thomas Hanbury, who purchased them for the purpose from the executors of the late Mr. G. F. Wilson (see *Gardeners' Chronicle*, August 15, 1903), gave a fresh impetus to

LORD AVEBURY, P.C., F.R.S., WHO OPENED THE RESEARCH STATION AT WISLEY.

the demand for a scientific department, and this demand was urged upon the Council by Professor Bateson and other speakers at the last important function held in the Chiswick gardens on September 29, 1903, in connection with the exhibition of vegetables. That the scheme is now in actual operation is due mainly to the unparalleled success of the Society in recent years, but thanks are due to the present Council for having determined to apply part of the increased income to this purpose.

We need not enter into a detailed description of the new laboratory as this was the subject of an article in our issue for April 13 last, when the exterior of the building was illustrated. As will be seen on reference to page 64 of our present issue, the Council is establishing a school of horticulture for training young gardeners, and for the first time in the history of the Society it will be able to instruct the students in the science of gar-

dening as well as in the arts of cultivation. It is scarcely necessary at this date to insist on the value of instruction in the principles that underlie practice. An intelligent knowledge of the means and processes by which plants subsist, of the conditions that accelerate or retard growth, of the various organisms in the soil that conduce to fertility, of the nature and effect of various manures on different plants, of the habits of insects and the life histories of fungus diseases is as necessary to the making of a perfect gardener as familiarity with the actual details of potting, digging, pruning, and other operations of practical gardening. The objections that have sometimes been made to scientific training have generally arisen from the fear that in the acquiring of such knowledge the student neglects to obtain the practical experience equally essential to successful cultivation.

The Society must therefore insist that its students, whilst acquiring theoretical knowledge, shall be encouraged to develop an appreciation and enthusiasm for plant-culture. A student who exhibits an indifference to cultural details, and has no desire to learn by experience the best methods of carrying out the various operations of gardening, or the proper seasons in which to do them, will certainly never become a good gardener. A gardener's highest quality lies in his skill as a cultivator, therefore the science he studies should be such as will help him to excel in the art of cultivation—it is an important means to an end, rather than a goal in itself. Mr. Chittenden, who has been appointed director of this department at Wisley, and whose portrait was published in our issue for April 13 last, may be trusted to take the proper view of this question, and so arrange the syllabus for his students that they will be able to learn those scientific principles which have the nearest relation to gardening practice.

The Surrey County Council has arranged with the Royal Horticultural Society to send a number of boys from the county schools for instruction at Wisley, but whether this will eventually lead to that Council having any voice in the management of the Wisley School we do not know. From remarks made by several of the speakers it is evident that the Society will do its utmost to obtain grants from the State, and in the event of these efforts meeting with success there is little doubt but that the Board of Agriculture and Fisheries will impose some condition or at least satisfy itself that the school is conducted in a manner the Board could approve. State aid, it may be pointed out, is always accompanied, in some degree at least, with State control.

But it is greatly to be hoped that the time and energies of the department will not be wholly absorbed by the school of horticulture. The mere teaching of science to students, important as it is, is not quite the work that those who have most desired the institution of a scientific department at Wisley had in their minds. It is in the making of science, rather than in its teaching, the Fellows are most interested, and the success or failure of the department will be largely determined by the amount of research work accomplished. Mr. Chittenden

WATER-SCENE IN THE GROUNDS OF THE VILLA D'ESTE, TIVOLI, NEAR ROME.

is just the man to undertake work of this description, but in order that he may do so it is necessary that his hands should not be tied, and all his time occupied, in the in-

and vegetables. It is for the solving of these by experiments conducted in the laboratory and in the garden that the scientific department will find its justification. The Society may also be able to provide facilities that may be placed at the disposal of properly qualified and accredited investigators who may wish to pursue scientific research upon special subjects, but who have not the facilities that may be obtained in a laboratory. How far arrangements can be made for such cases, however, can hardly be determined before the station has been in working order for some time.

Thomas Hanbury, who prevented it from being broken up, and, with his usual liberality, presented it to the Society. The Society dates back more than 100 years, having been founded as long ago as 1804 by Mr. Thomas

LORD BALFOUR OF BURLEIGH, K.T., WHO REPLIED FOR THE ROYAL HORTICULTURAL SOCIETY.

struction of the students. We have no reason to think that this will be the case, but at the very commencement it should be clearly understood by the Council what is expected of them by the Fellows, and it is that energetic research shall be made into such subjects as were mentioned in our issue for April 13 last, and which were quoted by Lord Avebury in his opening speech at Wisley. From time

THE company which assembled at Wisley for the opening ceremony consisted of about ninety ladies and gentlemen. Amongst those present were the President Sir Trevor Lawrence, Bart., Lord Avebury, Lord Balfour of Burleigh, Sir William T. Thistleton Dyer, Sir John T. D. Llewelyn, Sir Albert K. Rollit, Sir William Vincent, Sir William Chance, Sir Thomas H. Elliott, Prof. Michael E. Sad-

SIR THOMAS ELLIOTT, K.C.B., SECRETARY TO THE BOARD OF AGRICULTURE.

ler, Mr. Jeremiah Colman, Sir Geo. Watt, Mr. Harry J. Veitch, Mr. Arthur W. Sutton, Mr. W. A. Bilney, the Rev. W. Wilks, most of the members of the Society's Council, and of the Scientific Committee, and a few friends connected with the Surrey County Council. Luncheon was served in the gardens, at which Sir Trevor Lawrence presided. The toast of the Royal Horticultural Society was proposed by Lord Avebury in the following terms:—

While very sensible of the honour you have done me in inviting me to open this interesting laboratory, I cannot but feel, especially when I look round, that there are others who might have done so much more appropriately. One name especially—that of my friend Sir Trevor Lawrence, your president, who is himself so great an authority, and who has done so much to bring the Society to its present climax of prosperity—will occur to everyone.

As we stand here to-day, two men will be in all our thoughts—Mr. Wilson, whose loving care and horticultural skill originally made the garden what it was, and Sir

PROFESSOR MICHAEL E. SADLER, LL.D.

Andrew Knight, Sir Joseph Banks, and other distinguished botanists, but for many years it vegetated rather than flourished.

When your President was elected in 1885, the Society had 1,108 members, a goodly number certainly, but not enough, and the Society was in some pecuniary difficulties. Owing largely to his ability and energy it has now nearly 10,000 members, has assets without counting Wisley of some £70,000, and an annual income of £18,000.

[Mayall & Co., Ltd.

SIR WILLIAM VINCENT, BART., J.P., WHO RESPONDED FOR THE SURREY COUNTY COUNCIL.

Your centenary in 1904 was marked by the erection in Vincent Square of an exhibition hall and library costing £42,000, raised mainly by private subscription, and also by

Sir Thomas Hanbury's munificent gift of this property—one of his many public benefactions. Mr. Wilson, one of our many City men who have taken a warm interest in science, devoted his leisure during 24 years to the planting, arrangement, and development of the garden, which comprises 60 acres.

In accepting this important gift you have, I understand, two main objects in view:—

(1) The improvement of horticulture by giving the best possible training to a certain number of young gardeners, and

(2) The promotion of horticultural and botanical science by experiment and investigation.

The erection of this laboratory and research station meets a long-felt want in connection with the Society's work. In the United States and in our Colonies there are several such stations under Government supervision and maintenance, but in the home country the initiation, direction and support is left to private enterprise. The good work being done at the Royal Botanic Gardens, Kew, at the Botanic Gardens of Cambridge, Oxford, Edinburgh and other Universities is well known and appreciated, as is also the experimental work for some years past undertaken at Rothamsted by the late Sir John Lawes and by the Duke of Bedford at Woburn.

Among "the subjects it is hoped to experiment upon in the near future are soil-sterilisation by steam as a means of destroying pests of plants which live in the soil; an investigation into the influence of sterilisation on the plants cultivated in the soil; study of the bacterial flora of the soil; etherisation of plants; and certain plant diseases. Each of these subjects will entail a large amount of laboratory work, as well as experiments in the garden."

When we look round us at the endless variety of trees, shrubs and herbs, no two alike in their form, their leaves, their flowers, their fruit, or their seeds, and when we reflect that for every difference in form and texture, in colour or scent, there is some cause and explanation, comparatively few of which are yet known to us, we see what a rich and beautiful field of enquiry botanists have before them.

In fact, the range of research and enquiry is so wide as to be practically inexhaustible; I cannot doubt that, in addition to its other services to the community, the Society will, in connection with the garden, do much to promote horticulture both in its æsthetic and scientific aspects, and I have much pleasure in proposing the toast—Prosperity to the Royal Horticultural Society.

Lord Balfour of Burleigh, replying, referred to the progress the Society had made since Sir Trevor Lawrence became president, and, after mentioning some details in connection with the membership and income, said twenty years ago the Society's investments consisted of a debt of £1,100; they had now £26,000 besides real property. The predominant feeling in their minds that day was that they were opening up a new era of prosperity by making the practice and theory of horticulture go hand in hand. In that they were like the sister pursuit of agriculture. A few years ago there was almost a war between the practical and the scientific agriculturist. They looked upon each other with mistrust and contempt, but all that had now changed. If science were of use to agriculture how much more was it of use to horticulture? He did not belittle agriculture, for in a humble way he was an agriculturist, but, after all, the agriculturist only dealt with about a dozen different kinds of plants and half-a-dozen different kinds of animals,

whereas the horticulturist had thousands of plants to deal with, plants from every part of the world. The work the Society were undertaking was very necessary. Those engaged in the practical work of gardening came from a class who, when they had families, required to consider carefully how long they could keep their sons at home, and the temptation to turn them out at the earliest possible day to help the earnings of the family was a very great one, and, if it were yielded to, was likely to do a greater amount of harm to the young gardener than to a youth in any other profession at all similar.

Sir William Chance proposed "The Board of Agriculture," and, referring to the liability incurred by the Royal Horticultural Society in establishing a scientific department, besought Sir Thomas Elliott to convey to Lord Carrington such an idea of the proceedings that day that pressure might be brought to bear on the Privy Purse in favour of granting some degree of State aid to the scheme.

Sir Thomas Elliott, Secretary to the Board of Agriculture and Fisheries, contrasted official action with private enterprise, and remarked that when official action went on too quickly, private enterprise was apt to recede. But he was glad to be there that day, because in one instance recently politicians had forgotten their politics, and the Legislature had passed "The Destructive Insects and Pests Bill." This would probably mark the commencement of a new era. The Act armed the Board with considerable powers, and the Board would be careful to consult with its specialists before using those powers in particular instances. The Board, commencing with what appeared at the moment to be nearest to their hand, had instituted a crusade against the American Gooseberry-mildew, a disease which threatened to do considerable mischief in this country. In conclusion, Sir Thomas Elliott assured the company that his department would consider the needs of their horticultural clients just as much as they considered the needs of their agricultural clients.

Professor Michael E. Sadler proposed "The Surrey County Council," and complimented this authority upon the liberal patronage they had extended to horticulture in connection with their elementary schools and in other ways. In future, said Professor Sadler, the Council would elect year by year a number of boys from the schools, and these boys would be received at Wisley by the Royal Horticultural Society free of cost. They would receive at Wisley a scientific and practical education extending over two years. In September next a commencement would be made by the Council selecting five boys. Reference was then made to the historic character of the Wisley district, and mention made of William of Ockham, Thomas Day, and William Cobbett, all of whom had lived in the locality.

Sir William Vincent, Vice-Chairman of the Surrey County Council, after referring to the large amount of money the Council had to spend on the upkeep of the roads, said that last year the Council spent on special subjects (of which horticulture was the principal) a sum of £614. The estimates for the current year included a sum of £750 for similar purposes. Last year there were organised gardens in connection with 59 of the elementary schools, at which 993 scholars received instruction in gardening. Thirty-five of the teachers had spent their vacation at the South-Eastern Agricultural College at Wye, for the purpose of acquiring gardening knowledge.

Sir Trevor Lawrence, Bart., expressed the thanks of those present to Lord Avebury, after which he read an extract from a letter received from Sir Joseph Hooker in reply to a letter of congratulation sent to Sir Joseph on the attainment of his ninetieth

birthday. Sir Trevor said the progress of the Society had been most satisfactory, but it was not due to himself or his own work, but largely to the Council and the Rev. W. Wilks, their excellent secretary.

Sir John T. D. Llewelyn, Bart., said that Sir Trevor Lawrence had shown good generalship in that he had selected such excellent officers as the secretary and garden superintendent to carry out the work of the Society, but beyond that he was certain that much of the Society's success was due to the President, and it was owing to his influence that the questions connected with the establishing of the Hall and gardens had been settled so satisfactorily.

Thus terminated the formal proceedings connected with the opening of the Research Station. Many of those who most desired the Society to undertake this work have passed away before the consummation of their ideas, and three names seem particularly present in our mind, those of the late Sir Michael Foster, Sir Thomas Hanbury, and Dr. Maxwell T. Masters. Dr. Masters has written on this subject several times in these pages, even during the present year.

We have pleasure in publishing the portraits of most of the speakers at the opening ceremony.

THE SWANLEY HORTICULTURAL COLLEGE.—

The inaugural address of the nature study course will be given on Saturday July 27, at 5 p.m., by Sir DOUGLAS FOX. The course promises to be an interesting one, over 60 students having entered for it. A copy of the syllabus may be obtained from the secretary, Miss M. KEKEWICH.

READING UNIVERSITY GARDENS.—

Professor PERCIVAL has been appointed Professor of Agriculture and Horticulture at the Reading University, and Mr. CHARLES FOSTER, superintendent of the experimental garden, has been made Assistant Director of Horticulture. Those who have seen the excellent cultivation that is practised in this garden will be glad to know of Mr. FOSTER's appointment.

THE MIDLAND AGRICULTURAL AND DAIRY COLLEGE.—

The annual meeting will be held at Kegworth on Monday, July 29, at 3.15 p.m., when the report on the year's work will be presented. Sir JOHN ROLLESTON will address the meeting, and present the certificates gained during last session.

BOTANICAL GARDENS, CHRISTCHURCH, NEW ZEALAND.—

We are informed that Mr. JAMES DAWES has been appointed superintendent of these gardens. Before leaving England Mr. DAWES was head gardener for upwards of 20 years to Lord BIDDULPH, at Ledbury, Herefordshire, from which establishment he frequently exhibited fruit at the principal shows.

A CURIOUS NESTING PLACE.—

The following paragraph is taken from a recent issue of the *Devon and Exeter Gazette*:—"A strange find is recorded from Crediton. As some Bananas were being pulled from a large bunch a birds' nest, containing two eggs, was revealed. The nest was composed of cocoanut fibre and sticks. The eggs were dark spotted and quite perfect. It is supposed that the bird left the nest and was unable to find its way back. As the Bananas grew the nest and eggs were concealed and preserved." That the bird was a native of the country where the Bananas grew is evident from the fact of the nest being partially composed of cocoanut fibre, and it would have been interesting to know the name of the bird, which could have been ascertained by submitting the eggs to an ornithologist.

EXPERIMENTS IN ACCLIMATISATION IN THE TROPICS.—Until the present time researches in acclimatisation of European and other plants have been confined to relatively few species, notwithstanding which interesting results have been obtained. These have proved it to be essentially necessary to experiment with every species, it having been observed that two species of the same genus, and natives of one and the same climate, behave in a perfectly contrary manner in the Tropics, the one vegetating as in its native country, the other dying out. *Artemisia vulgaris*, a well-known European plant, growing in the Botanical Garden at Saigon, ripens its seeds there. *Sambucus canadensis*, a Canadian Elder which withstands an enormous degree of cold in its native country, succeeds quite well in a botanical garden in Central Africa, not far distant from the equator. *Taraxacum officinale*, the common Dandelion of Europe, grows between the Tropics; and the common Milk Thistle (*Carduus Marianus*), a most troublesome weed, found almost everywhere, is likewise a tropical weed. It is likewise a fact that many plants, natives of the warmer regions of the world, as, for example, those of the Mediterranean region, will not exist in tropical countries, and it is tolerably certain that here lies an enormous field for the experimentalist's work. "When I have established myself in Java," writes M. BUYSMAN, of Middelburg, Holland, in *Die Gartenwelt*, of June 15, "I shall make experiments with every kind of plant of which I can obtain seeds, and eventually record the dimensions arrived at by each individual plant. That plants which will withstand the heat of tropical countries usually reach enormous dimensions is a well-known fact. A resident in Queensland—that is, in tropical Australia—informs me that an Oleander growing in his garden has reached a height and diameter of 36 feet. In Java, with its magnificent climate, experiments may be carried out during the entire year, and I intend to carry out extensive researches in acclimatisation, the results of which I hope will be of importance to horticulture in general."

THE BUD DISEASE OF LILAC.—In parts of Germany, a condition of the buds of the common Lilac has been noticed, to which has been given the names "Bud disease" and "Witch-knot," or "Witches' broom," under which two last names something rather different is understood. The cause of the disease has been determined by Dr. R. LAUBERT to be a mite so minute as not to be visible to the naked eye—*Phytoptus Loewi*, one of the gall-mites which are the causes of so many diseases and malformations in plants. This minute creature is impervious to heat and cold, and is capable of existing in the perfect state throughout our coldest winters. It is seen as a reddish mass under the bud scales of the plants, consisting of numerous cylindrical caterpillar-like forms $\frac{1}{2}$ mm. long, 1-20 mm. broad, furnished at the fore end with four short legs. These mites were discovered in diseased buds taken from Lilac bushes on January 25 last, which had been exposed to 12½° and 20° Celsius. They became lively after being in a room for a short time, so that neither the great cold nor the sudden warmth of the room had any injurious effects on them. As with the Black Currant bud mite, so with this new-comer; it is a matter of extreme difficulty to discover a method reasonably practicable of dealing with this enemy of the gardener. The likeliest means for their destruction would be to apply some kind of wash or powder to the affected bushes in the second half of the month of May, when the mite leaves its place of concealment and is searching for a new one. The notice from which these details are taken appeared in

Die Gartenwelt for June 15 last, from the pen of Dr. LAUBERT, and it may induce other observers to give their experiences concerning this mite, for there is but little existing literature on the subject, beyond disconnected notices concerning bud disease and witch-knot disease of *Syringa*, as, for instance, those of LOEW (Vienna, 1879); WITTMACK (Berlin, 1882); FRANK, 1896; and VON TUBEUF, 1901 and 1905.

SENSITIVENESS OF THE STIGMA IN TORENIA FOURNIERI.—At this season the flowering of *Torenia Fournieri* is at its best, and it may not be without interest, writes C. RIMANN in *Die Gartenwelt* for June 22, to observe the movement of the stigma when touched. The flower of this plant exhibits an extended stigma, at the end of which are two slightly-bent-asunder segments. When the stigma is touched with a lead pencil point, or camelhair brush, the segments close in the manner of the leaves of *Dionæa muscipula*. A further discovery showed that these expanded again after a short period of time. Flowers were observed which remained closed. When pollen was conveyed on a pencil to the stigmas, it was noticed that these segments of the female organ became permanently closed, so that one came to the conclusion that the closing was due to effective pollination of the flowers, and the movement observed was intended to hold fast any insect which might be a pollen carrier; but as an insect might visit a flower and bring no pollen, the opening of the segments after an interval would allow it to escape.

THE BEST FRUITS.—The Pomological Section of the National Horticultural Society of France has published a work for the use of members who are interested in fruit-growing. In size, *Les meilleurs Fruits*, au début du xxe siècle, is 11in. x 7in., and consists of 632 pages of well printed text. It is issued in paper wrappers and liberally illustrated in black and white. The general plan of the work, like most of the publications of this society, enables the reader to have easy access to the information contained in it. The book begins with a brief history of the science of pomology, which is followed by a treatise on diseases and insect pests, with directions for the necessary treatment. The body of the work contains a very full account of the varieties of fruits selected by the compilers, and they number in all about 250, all of them being arranged in alphabetical order. The descriptive matter gives the name, synonyms, origin, followed by details concerning the tree or plant, as the case may be, foliage, and full description of the fruit. There are several good tables, one of which deals with the season of maturity of the fruits recommended: another, with the form it is considered best for the trees to be grown in. Notwithstanding the size of this work, reference is greatly facilitated by the excellent arrangement. The book is primarily intended for members of the society, and we do not know whether it can be obtained by the general public, but in any case it is an acceptable addition to pomological literature.

VITIS VULPINA.—A correspondent writing on this species in the issue of the *Oesterreichische Garten-Zeitung* for July states that there is no more suitable plant for quickly covering tree trunks, buildings, walls, fences, and arbours and in particular in forming festoons along or above garden fencing, than the Fox Grape vine, *Vitis vulpina*, a smooth-stemmed, tall, climbing species, which makes annual shoots 9 feet in length. The heart-shaped leaves of this plant are of a bright green colour on both sides; the greenish-yellow flowers which appear in June are fragrant and the unpalatable berries that follow are of a dark blue tint. The effect of this

but little-known plant is exceedingly graceful when the shoots are trained festoon-wise over iron standards or lattice work. For such purposes the plants are set out at distances of from 2½ to 3 yards, or wider, apart, and a pole of iron or hard wood is placed to each plant with suspended chains stretching from one to the other.

Publications Received.—*The Dahlia News (America)* for June.—*Annual Report of the Royal Botanic Garden, Calcutta, and the Lloyd Botanic Garden, Darjeeling, for the year 1906-1907.*—*Bees for Pleasure and Profit*, by G. Gordon Samson. Published by Crosby, Lockwood and Son, price one shilling.

HORTICULTURE IN EGYPT.

(Concluded from page 42.)

TEMPERATE FRUITS.

The number of fruits which can be successfully cultivated in Egypt is remarkable. Among tree-fruits from temperate regions the most extensively grown is the Mish-mish, a very poor variety of the Apricot, which is common throughout the north of Africa from Egypt to Morocco. The trees are almost always grown from seeds. There is little doubt but that with reasonable treatment the better varieties of Apricots could be grown with equal success. Plums, Pears, and Peaches are all of poor quality, but what is possible by proper cultivation and the introduction of better varieties has yet to be proved, although the presence of about half a dozen Plum trees of European varieties bearing good crops of excellent fruit places the question in the case of this fruit beyond doubt.

Large quantities of excellent Strawberries are grown around the towns in Upper Egypt. The plants continue bearing for six months, and the value of a good crop is about £50 per feddan: in one case which came under my notice, the crop was sold for £72 per feddan. The expenses connected with the cultivation of this crop, including rent and water charges, are rarely more than £30. Many Europeans grow their own Strawberries, as the native has a habit of licking off any dirt which happens to be present on the fruit!

The most important sub-tropical fruits are the Grape and the Fig, and of these good varieties exist, therefore both are profitable crops. Pomegranates are also common throughout the country, but the fruits are usually picked when green for use in dyeing and tanning leather. If they are not gathered until they are ripe it is necessary to enclose each in a muslin bag, to ward off a caterpillar which lays its eggs inside the pulp.

The Japanese Date Plum, *Diospyros Kaki*, grows very freely and bears heavy crops of luscious fruits, which sell in the market at from 1½d. to 2½d. each. Unfortunately the tree is not common, but it is easy of propagation, and its planting will no doubt spread quickly throughout the country. The Japanese Loquat is more common, but this fruit is much less esteemed than the preceding. The most important ground-fruits in Egypt are Water and Sweet Melons, and Tomatos. All these grow with the utmost ease without staking or other care except watering.

TOMATOS.

Large numbers of persons are engaged in the marketing of Tomatos, and a considerable export trade is done with Austria, Russia, &c. Last year the value of Tomatos exported amounted to more than £20,000.

Purely tropical fruits appear to thrive in Egypt, as well as those from more temperate regions, in spite of the cold weather often experienced in winter. Mangos are bearing good crops at the present time, and bringing enormous profits to their owners. Sapodilla Plums, Indian Damsons, Avocado Pears, Guavas and Sweet Sop are all growing well, in addition to various other fruits of minor importance, such as the Rose Apple and Brazil Cherry. Unfortunately, however, no one has been sufficiently enterprising to propagate them in quantity, so that in the case of many species there are but few trees in the country. Something will no doubt be now done in this matter by the horticultural societies.

When the supply of these tropical fruits becomes sufficiently great to allow their being exported, Egypt will be able to send to the European markets kinds which are as yet unknown outside tropical countries.

of the industry, and starting operations. For English gardeners with a little capital and business training, there are good prospects in all branches of commercial gardening in Egypt. *T. W. B.*

FIG. 33.—AMPHICOME EMODI: FLOWERS ROSE-COLOURED, WITH ORANGE-TINTED THROAT. (Exhibited at R.H.S. meeting by Messrs. James Veitch & Sons.)

In the production of vegetables, as in the cultivation of fruits, there is a great future for the country. The quantity of Cabbages and other vegetables exported yearly is growing, and it is not any exaggeration to say that Egypt will at no distant date become the market garden of Europe. Several land companies and private land owners are recognising the vast possibilities

of the industry, and starting operations. For English gardeners with a little capital and business training, there are good prospects in all branches of commercial gardening in Egypt. *T. W. B.*

AMPHICOME EMODI.

THE genus *Amphicome* consists of only two species, both natives of Northern India. They are closely allied to the *Incarvilleas*, and the plant now illustrated at fig. 33 was described by Dr. Wallich as *Incarvillea Emodi*. *Amphicome arguta* was the first species to flower in this

country in the Horticultural Society's garden in 1837. It is taller and more elegant in growth than *A. Emodi*, the leaves and flowers being smaller. It grows at an elevation of 6,000-8,000 feet in the North-west Himalayas.

A. Emodi received an Award of Merit from the Royal Horticultural Society, when exhibited by Messrs. James Veitch and Sons, Chelsea, on June 25 last. It is the more ornamental of the two species for garden purposes. The flowers are larger than those of *A. arguta*, and very much resemble *Incarvillea Delavayi*, though smaller. The racemose inflorescences are 1 foot to 2 feet in height, and they bear numerous flowers. These open in succession, there being sometimes as many as 36 in all. Some of the racemes are branched. The flowers are rose-pink in colour, with an orange throat. The habit of the plant is dwarf, almost creeping; the leaves are green, glabrous and bear numerous leaflets. Seeds of this plant were received at Kew from India in 1852, and being grown in a cool pit, flowers were produced in 1855. *A. Emodi* inhabits the mountains of Emodi. The species is figured in the *Botanical Magazine*, tab. 4,890.

Although found at high altitudes, neither of the species of *Amphicome* is hardy in this country, although in the mild climate of the south-western counties the plants will live through the winter if protected from excessive moisture and severe frosts. The greenhouse affords the most suitable place for the cultivation of the plants. Propagation is effected by seeds and cuttings. The seeds should be sown in spring, and some of the plants thus raised will flower in the second year. Cuttings can be rooted in sandy soil from March onwards. The most suitable soil for use in potting is one consisting of fibrous loam, peat or leaf-mould and sand. It must be well drained, as *Amphicomes* dislike excess of water at any season, and during winter they require very little water. *O.*

HOME CORRESPONDENCE.

CARNATIONS AT STANLEY PARK.—At Stanley Park, Stroud, the residence of Sir William Marling, Bart., *Souvenir de la Malmaison* Carnations are grown in large numbers. The plants are accommodated in a large span-roofed structure, and they are in the finest condition of culture. The varieties include *Princess of Wales*, *Old Blush*, *Margaret*, *King Oscar*, *Duchess of Westminster*, *Mercia*, *Grace*, *Lady Grimston*, *Cecilia*, *Albion*, *Mrs. Trelawny*, *Mrs. Martin Smith*, *Lord Welby*, *Nell Gwynne*, and many others. Mr. Walton, the gardener, is to be congratulated upon the beautiful show of these flowers. *William Driver, Hope Cottage, Stonehouse.*

PINES ATTACKED BY PERIDERMIIUM.—Small trees of *Pinus Strobus*, *P. Lambertiana*, *P. monticola*, and *P. aristata* growing in these gardens have been attacked by this fungus. From a close examination of the infested trees, the progress of the disease appears to be as follows:—The small branches are attacked first and the bark around the branch for a distance of a few inches swells, and later small bladders are formed on it. These burst in April and shed innumerable spores, which, to the naked eye, resemble yellow pollen. Just previous to the ripening of the spores the disease may perhaps be checked, and the tree saved by cutting away the affected parts, but, unfortunately, the latter being small, they are easily overlooked. The diseased parts are only conspicuous when the bladder-like swellings burst, and they are more often present where the branches are thickest. The following season the disease encircles some of the larger branches, and frequently the main stem, the rings being sometimes 9 to 12 inches in width. Much resin is exuded at the seat of injury; the wood at this spot is rendered peculiarly soft, and when cut through it is found to be soaked with resin. In spring the colonies of yellow spores are very noticeable. When the central stem is affected there appears to be no remedy, and the part above the injury soon dies. In the case of our trees as many as possible of the diseased parts have been removed and burnt, and the remainder, together with the soil, sprayed with a solution of sulphide of potassium. *J. Comber, The Gardens, Nymans, Crawley, Sussex.*

STRAWBERRY THE LAXTON.—I read Mr. L. Castle's defence of this new Strawberry (see p. 13) with interest, because there can be no doubt that it does splendidly at Bedford, where it is planted in large breadths and fruits heavily. When it was presented to the Fruit Committee of the Royal Horticultural Society, the variety raised hopes, for not only were the fruits rich in colour and of good form, but they were specially rich in flavour. Has the cause of its failure in some directions been due to a too rapid increase from late weak runners, or to the plant requiring stiff, strong loams, such as is seen at Bedford, in preference to lighter soils? Mr. Markham's practice of obtaining plants by selecting the earliest runners from young non-fruited plants is no doubt the best, and it is the plan most generally adopted by good growers. Were The Laxton propagated in this manner only, it is very possible that good results would follow. It is certainly a delicious fruit. D. A.

ROSE.—I recently discovered a Rose with flowers somewhat resembling the variety Austrian Copper in colour, but rather brighter in tint and much smaller in size. The foliage and habit of growth were like those of the common Sweet Briar, and the wood was covered with a bronze-coloured bark. Upon examination, I found this was an old stock, upon which had been worked, presumably, a trailing variety, as it was planted at the foot of a garden arch. The plant had evidently been in this position many years, as the wood at the base was very large, and showed evidence of much pruning. This stock was unknown to me, and when reading Dr. Bonavia's note on p. 14, I thought that my variety might be the same as his. Unfortunately I am not able to send specimen flowers for comparison, as the plant has since been destroyed. C. R.

SWEET PEAS TO NAME.—As one of the judges of the audit class for Sweet Peas at the recent Sweet Pea Exhibition, I wish to say that it was with extreme reluctance myself and colleagues found it needful to disqualify three collections. In two cases flowers that were probably Lord Rosebery were shown as John Ingman, and in one other exhibit two spikes of a somewhat similar, yet diverse variety were found in a vase in which the rest of the flowers were properly named. In this latter case no excuse can avail, as anyone could readily see that the two spikes were distinct from the true variety. In the case of the two other collections, it is probable that the exhibitors received from some seedsmen the variety under the name of John Ingman, and showed it in the belief that it was correctly named. If that were so, I would suggest that in future the competitors be required to state on their name cards the name of the vendor from whom the seeds were obtained. That might lead to the exercise of greater care. A. D.

A HEAVY THUNDERSTORM IN NORTH WALES.—On the 21st inst. we experienced a terrific thunderstorm that caused much damage to the growing crops. The lightning killed several sheep, and shattered some trees to pieces. In less than three hours 1.75 inch of rain fell, and the rain was accompanied by hailstones as large as marbles. One farmer had his Swedes in a field washed away by the heavy rush of water. Many things in the gardens are splashed to such an extent that they are useless for the time being, and the effect of this is seen as high as 2 feet 6 inches from the ground. Other plants were battered to the ground. The storm lasted for more than 13 hours. J. S. Higgins, Rhinog Gardens, Corwen.

STORM IN STAFFORDSHIRE.—We experienced a severe thunderstorm in this neighbourhood on the 22nd inst., between 1.30 and 4.30 a.m. On this estate a very large Oak tree was torn completely up and the bole was split into four large pieces; one piece weighing about 10 cwt. was thrown a distance of 30 yards, and some of the other pieces were hurled 100 yards. The top of the tree finally rested where the roots of the tree should be. Arthur Bateman, Hunts Hall Gardens, Tamworth, Staffs., July 23, 1907.

THE INTERNATIONAL HORTICULTURAL EXHIBITION, 1866.—A few weeks ago the *Gardeners' Chronicle* published a photograph of the members of the committee in connection with the lamented death of Dr. Masters. It was mentioned that Mr. Harry J. Veitch, V.M.H., is now the only survivor. In scanning the group my attention was arrested by a remarkable likeness between one of the

gentlemen figured and a well-known engineer, Mr. Edward Easton, who has a country house in this district. This morning I met Mr. Easton and mentioned the circumstance. He smilingly assured me that he is the same Mr. Easton as formed one of the famous committee. Mr. Easton gave me some very interesting recollections of the opening day, one item which dwells in his memory being that he was compelled to collect admission money in his hat! Walter P. Wright, *The Grey House, Lyminge, Kent*, July 22, 1907.

SUMMER PRUNING OF FRUIT TREES.—A large percentage of prominent woodbuds on strong shoots of the current year's growth are, as the result of summer pruning, converted into fruit-buds which will blossom the following spring. A number of the less prominent woodbuds on the weaker and later summer-pruned shoots are changed into embryo fruit-buds that will duly mature during the following spring, summer and autumn, and develop blossoms in the spring of the next year. H. W. Ward, Rayleigh.

NEW HYBRID TREE PÆONY, MADAME LOUIS HENRY.—This apparently beautiful and interesting hybrid is described by its raiser, Monsieur Henry, in the current number of the *Paris Revue Horticole*. It is botanically interesting as being the first result of an endeavour to fertilise the flowers of the golden yellow-flowered P. Delavayi or P. lutea with the pollen of one of the rose-coloured forms of P. Moutan. The initial difficulty that had to be overcome in effecting this cross was that P. lutea flowered about a fortnight earlier than the Moutan varieties, but pollen was ultimately secured from one of the handsomest of the Moutan varieties, named Elizabeth. Seventeen seeds were obtained, only five of which germinated, of which only two could be reared. The flower is said to show all the characteristics of both parents, borrowing from its pollen bearer the beautiful red ground colour with which is mingled the bright, intense yellow of the seed bearer, producing a beautifully striped flower at least three times the size of that of P. lutea, which much resembles the flower of a Trollius. W. E. Gumbleton.

SOUVENIR DE LA MALMAISON CARNATIONS.—A magnificent collection of these plants in flower was noticed at Luton Hoo Gardens on the occasion of a recent visit, and Mr. Metcalfe, the gardener, is to be congratulated on having such a clean, healthy stock. This grower layers his plants early in the season, and the largest he places in 9-inch and others in 6-inch pots. This does not provide much root room, but it is sufficient, as the larger plants were many of them upwards of 6 feet in height and flowering profusely, some of the blooms being upwards of 5 inches in diameter. The collection at Luton Hoo includes the varieties Jane Seymour (pink), Princess of Wales (pink), Thora (flesh colour), Calypso (blush), Lord Welby (red, an extra large variety), Grace (rose-pink), W. H. Cutbush (crimson), H. J. Jones (dark crimson), King Arthur (dark crimson), Mrs. Trelawny (light red), Churchwarden (scarlet), and Duchess Consuelo (yellow). Among the many improvements made in these gardens, it is pleasing to find that the young gardeners have not been forgotten, for a new bothy has been built, fitted with every convenience and means of comfort. This thoughtful consideration and kindness to the employees on the estate is much appreciated. W. H. Divers, Belvoir Castle Gardens.

NAMES FOR YUCCAS.—The following is a supreme effort at name-making which would be hard to beat, and is a list of Yuccas—60 in number—which have come to hand in one lot. When the Yuccas increase at this rate the lists of the future will be quite formidable. J. Smith, Newry. [Mr. Smith appends a list containing 50 names.—Ed.]

BONES FOR A VINE BORDER.—It is perfectly true that half-inch bones are in most soils a long time in decaying, and consequently they yield but little nourishment to vines. I have long discontinued using them, although I usually prepare one or more new borders every season, and now use steamed bone flour with good results. I have no means of knowing how long this material lasts in the border, for it soon becomes invisible. A good dressing of powdered bones should be applied to the surface of the border every alternate autumn, and it will speedily find its way down into the soil. In one

case that came under my notice, half-inch bones almost wholly disappeared in one season, but the soil in which they were placed was very deficient in lime. Wm. Taylor, Batu.

—Is W. P. R. engaged (p. 14) in knocking a hoary tradition on the head, when he impugns the value of half-inch bones as a manure for vines, and, as a natural corollary, other plants? The tradition has had in its day many strong believers, and amongst others the late Mr. A. F. Barron, whose book on the vine is still the standard work on the subject, and who advises the use of small bones because they continue to furnish plant food for many years. W. P. R.'s experience seems to have been that half-inch bones are practically insoluble. Their ready conversion into plant food may largely depend on certain chemical constituents in the soil. Mr. Barron, however, lays emphasis on the value of bone meal, dissolved bones, and horn shavings (practically soft bone), as being most valuable manures. A.

GOOSEBERRIES AND CURRANTS.—It is far from being a pleasant vocation to pose as a prophet of evil. Still, some writers—even scientists—seem to revel in the function. In the observations on the Gooseberry-mildew under the name of Mr. Salmon, I observe it is said: "The disease, which unless resolutely stamped out, will gradually invade and ruin their Gooseberry plantations just as the 'Big Bud' mite has ruined Black Currant plantations." It is an odd comment on this prediction that we have never had finer crops of both Gooseberries and Black Currants than this year. I think, when the crop returns are published in your pages, it will be found that this state of things is widespread. That being so, one fails to see why indulgence should be given to such gloomy anticipations. They remind one of what was said many years ago respecting the Potato crops, yet without repressive legislation Potatoes to-day are better in health and strength than ever. After all, the optimistic cultivator is the more reliable worker and adviser. A. D.

THE WEATHER IN DURHAM.—We have never before experienced such a cold, wet spring and summer as those just past. The Apple crop is a complete failure here, for although we have a large number of trees, not a single fruit is to be seen upon them, except in the case of three young trees planted at the foot of a wall. Early in the spring there was every prospect of an abundance of bloom, but owing to the continued cold and wet weather the blossoms rotted on the trees. Other fruits, including Plums, Currants, Gooseberries, Strawberries, &c., are promising fairly good crops. Pears are scarce. I have not seen an account of the Apple crop in southern counties, but am anxious to do so. Hailstones fell in the first week of June, at which time we also had cold, frosty nights. W. H. Lund, Egglestone Hall Gardens, near Darlington.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 24.—The ordinary fortnightly meeting of the committees took place on Tuesday last in the Society's hall in Vincent Square.

The ORCHID COMMITTEE recommended four Awards of Merit to novelties.

The FLORAL COMMITTEE recommended four Awards of Merit, and there were as many as 31 groups staged for inspection by this committee.

The FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to a known variety of Strawberry, namely, Fillbasket.

At the afternoon meeting 78 new Fellows were elected. A paper on "Rare Trees and Shrubs in the Open Air" was announced for reading by the Hon. Vicary Gibbs, of Aldenham, but this gentleman was unable to be present, and the paper was not delivered. The lantern slides, however, which were to illustrate the paper were shown on the screen, and the secretary, the Rev. W. Wilks gave a short description of each as it was presented.

Floral Committee.

Present: Henry B. May, Esq., in the chair; and Messrs. C. T. Druery, Jno. Green, T. W. Turner, R. C. Ncutt, J. T. Bennett-Poë, J. W. Barr, H. J. Cutbush, W. Howe, Geo. Reuthe,

Jas. Douglas, Arthur Turner, Chas. Dixon, H. J. Jones, C. E. Pearson, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, R. C. Reginald Nevill, E. T. Cook, and R. Hooper Pearson.

Lord ALDENHAM, Elstree (gr. Mr. E. Beckett, V.M.H.), displayed a large and interesting exhibit of sprays of flowering and ornamental-foliaged trees and shrubs. The exhibit was of much educational value, as affording a knowledge of showy species and varieties for the shrubbery and garden. The display was arranged across the whole of the platform end of the Hall on one long table. Some of the best specimens amongst this fine collection were *Buddleia variabilis*, *Acer rubellum*, *Philadelphus grandiflorus*, *Jasminum revolutum*, *Cassinia fulvida*, *Cistus laurifolius* (finely in flower), *Zenobia speciosa*, and *Berberis Darwinii*. Near by, and from the same gardens, was a well-flowered batch of *Streptocarpus*, with flowers in shades of violet, purple, pink, white, &c. The plants were in all cases abundantly flowered, those of the first-named colours being especially strong, with flower stems a foot or more in height. The white-flowered varieties were of dwarfier habit, but also very freely flowered. (Silver-Gilt Flora Medal.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed a miscellaneous group of greenhouse flowering and foliage plants. *Lobelia Richardsonii* was shown on an elevated stand with long growths overhanging and terminating in bunches of pale blue-coloured flowers; it would form an admirable subject for planting in hanging baskets. *Impatiens Holstii* has flowers of a rich orange-scarlet shade; *I. The Sultan* is a magenta self-coloured flower. Boxes contained *Spiræa Bumalda* and the finely-coloured variety *Anthony Waterer*. *Ceanothus* "Georges Simon" has large terminal inflorescences of a pale pink colour. We also noticed a spray of the beautiful *Stuartia Pseudo-Camellia* described in our last issue, p. 51.

Messrs. H. B. MAY & SONS, Edmonton, showed big clumps of *Ixora Williamsii* (coral red), *I. Fraserii* (pale red), and *I. macrophylla*, in a collection of other flowering plants and choice Ferns. The last-mentioned *Ixora* was shown in 5-inch pots, each with a terminal head of bright-red flowers, the inflorescences measuring over 1 foot in diameter. Amongst the other flowering plants we may mention *Clerodendron fallax*, *Salvia* "Zurich," *Solanum jasminoides*, and *Hydrangea paniculata*. (Silver-Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., showed 13 species of *Eucalyptus* in small pots, raised from seeds sown in January of this year.

Messrs. S. BIDE & SONS, Farnham, Surrey, exhibited an extensive group of Roses, all of their new variety *Queen of Spain*. Some of the flowers were shaded pink, and others were cream-coloured, according to the age of the bloom. (Silver Banksian Medal.)

Messrs. W. PAUL & SONS, Waltham Cross, Herts., showed a pretty display of Roses in baskets, stands and boxes. Several were new, and one is described under Awards. Another new variety is *Mrs. Isabelle Milner*, a hybrid perpetual Rose, with white petals flushed with pink; *Marquise de Sinety* is also new—the petals are of a bronzy-yellow shade. The exhibit included *Pharisaer Celia*, *Perle des Jaunes* (bronzy orange), *Earl of Warwick*, *Konigin Carola* (pink), *Commandant Felix Faure* (dark crimson), *Prince de Bulgarie*, *Joseph Hill*, and many other varieties. (Silver Flora Medal.)

Mr. A. F. DUTTON, Iver, Bucks., had a superb lot of Carnations, border kinds in pots, being shown side by side with the American tree varieties. In the former section, Mrs. Forbes and Daffodil stood out conspicuous among those with self yellow-coloured flowers, while *Trojan* and *Albion*, among whites, were equally good. The tree varieties were shown in good style, and in the best varieties. The group was one of the finest of these flowers exhibited in the Hall during the present year. (Silver-Gilt Banksian Medal.)

Messrs. WM. CUTBUSH & SONS, Highgate, N., displayed Carnations of *Souvenir de la Malmaison* and border kinds. One handsome batch was of well-grown plants of the variety *King Arthur*, and as a companion to this fine scarlet-coloured variety was another group of the pure white *Trojan*. Of the "Malmaison" type were shown *Yaller Gal*, *Monk*, and *Princess of Wales*. (Silver-Gilt Flora Medal.)

Mr. JAMES DOUGLAS, Edenside, Great Bookham, displayed a fine collection of Carnations in about 60 varieties. The pick of both the border and the *Souvenir de la Malmaison* types were seen in this display, and all were shown in the best condition of culture. Amongst the border varieties were seen *Goldfinder*, of the shade known as apricot; *Miss Willmott*, a perfectly-formed flower of coral-pink shade; *Helen Countess of Radnor*, one of the finest of all, with flowers a rich crimson; *Cupid*; *Mandalay*; *Duchess of Wellington*; *Lady Hermione*. Amongst the *Souvenir de la Malmaison* varieties were noticed *Gemma*, of rose-pink colour with a trace of salmon; and *Maggie Hodgson*, the finest of all the dark-coloured flowers. (Silver Flora Medal.)

Mr. S. MORTIMER, Rowledge, Farnham, was awarded a Silver Flora Medal for a display of Carnations.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, arranged a water-garden on similar lines to that staged by him at the recent Holland House show. The quality of the exhibit, its conception, and mode of arranging left little to be desired, and from the group much instruction was gleaned. Amongst noteworthy plants in the display were the yellow-flowered *Calla* "Mrs. Roosevelt"; many good *Liliums*, such as *L. pardalinum*, *L. canadense*, *L. Grayii*, and *L. Humboldtii* magnificent; *Water Rushes*, *Spiræas*, *Gunneras*, *Bamboos*, and many other moisture or water-loving plants. On an adjoining table Mr. PERRY staged a collection of many of the best herbaceous plants in season, and in which *Oriental Poppies* were a notable feature. (Gold medal.)

Mr. MAURICE PRICHARD, Christchurch, Hants, showed seasonable hardy flowers of good quality. In the centre of the exhibit was a group of *Astilbe* "Silver Sheaf," a very floriferous variety. Another plant with tall spikes of white flowers is *Cimicifuga americana*. Two yellow-flowered *Richardias* were labelled *Solfatari* and *aurata*. (Silver Flora Medal.)

Mr. B. LADHAM, The Shirley Nurseries, near Southampton, showed a number of varieties of *Gaillardias* with flowers ranging from light yellow to shades of red. The best varieties were *Yellow Prince*, *Superb* (a fine, dark-coloured variety), *Aurora*, *Shirley*, and *Sulphur Gem*. Mr. LADHAM also showed bunches of perpetual-flowering *Pinks*.

Messrs. V. N. GAUNTLETT & Co., Chiddingfold, Surrey, showed about 40 varieties of *Iris Kaempferi*. *Kimono* is a fine flower, with broad, white segments that are tinged with blue. (Bronze Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, exhibited vases of Sweet Peas of popular varieties, and as a background were a number of hardy flowers, including the rose-coloured *Lupinus polyphyllus*, *Galega bicolor*, *Telekia speciosa*, *Chrysanthemum maximum* Mrs. Charles Lowthian Bell, a large-flowered form of this well-known herbaceous plant, with clear, white petals; *Eryngiums*, *Delphiniums*, &c.

Herbaceous *Phloxes* were displayed by Messrs. GUNN & SONS, Olton, Birmingham, in large, effective masses of distinct kinds. Their fragrance was very noticeable. A few of the best shown were *Etna*, *Iris*, *Sheriff Ivory*, *Eugene Danzanvilliers*, *Tapis Blanc*, and *Sylphide*. (Silver Banksian Medal.)

Exhibits of hardy flowers were also shown by Mr. JOHN FORBES, Hawick (Silver Banksian Medal); Messrs. T. S. WARE, LTD., Feltham (Silver Flora Medal); and Mr. G. REUTHE, Keston (Silver Banksian Medal).

Messrs. J. PEED & SON, West Norwood, S.E., filled a large table with double-flowered *Begonias* and *Gloxinias*.

A large table was filled by Messrs. WM. ARTINDALE & SONS, Nether Green, Sheffield, with showy hardy flowers in variety, and amongst these were fine *Lilies* and *Carnations* of the border section.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed an interesting collection of hardy *Ericas*, including many forms of our native species, and hardy *Fuchsias* of the *Riccartonii* type in several varieties.

Mr. J. BRUCKHAUS, Orleans Nursery, Twickenham, showed a fine lot of ten-week Stocks. The plants in their large size and handsome spikes of fragrant flowers exhibited the highest degree of culture.

Messrs. CANNELL & SONS, Swanley, staged a fine assortment of Stocks, having complete plants pulled from the ground. The plants were free in flowering and of perfect bush-like habit of growth. A brilliant display of *Antirrhinums* was also exhibited by this firm.

Messrs. JAMES CARTER & Co., High Holborn, London, staged a very pretty display of Sweet Peas as a foil to their extensive exhibit of culinary Peas.

Vases of Sweet Peas of standard varieties were shown well by Messrs. JOHN K. KING & SONS, Coggeshall, Essex; and another good exhibit of these popular flowers was displayed by Miss ALEXANDER, Oakbank, Seal, Sevenoaks (gr. Mr. John T. Tubb). (Silver Banksian Medal.)

Messrs. HUGH LOW & Co., Bush Hill Park, Enfield, arranged a very pretty exhibit of Carnations, Roses, and Hydrangeas. *Rose Baby Dorothy* is a small polyantha variety, with big clusters of bright pink flowers.

Messrs. DOBBIE & Co., Rothesay, and Mark's Tey, Essex, showed a dark red-coloured Sweet William *Dianthus barbatus*, with double flowers, and a handsome, white *Godetia* named *Duchess of Albany Improved*.

AWARDS OF MERIT.

Campanula persicifolia var. *Wm. Lawrence*.—A variety with blue flowers that expand more widely than those of the type. Shown by Mr. W. LAWRENCE, Eggescliffe.

Delphinium Mrs. G. Ferguson.—An excellent double-flowered variety with perfectly cream-coloured flowers. Shown by Mr. G. FERGUSON, Weybridge.

Rose Hugo Roller.—A beautiful and fragrant Tea Rose, the outer petals of which are red, almost crimson, and the inner petals cream-coloured. Shown by Messrs. W. PAUL & SON.

Spiræa camtschatica rosea.—A plant was shown by Mr. AMOS PERRY with fine rose-coloured inflorescences under the name of *S. venusta* "Beauty," but the committee considered it to be a form of *S. camtschatica* (*gigantea*) *rosea*. Mr. Perry stated subsequently, however, that he had raised the plants from seeds of *S. venusta*, and though the differences between the two species do not appear very great, the plant shown appeared to us most like *S. venusta*, which is synonymous with *S. lobata*. It is less gross in growth than *S. camtschatica*.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, De B. Crawshaw, W. Bolton, W. A. Binley, H. Little, W. Boxall, G. F. Moore, R. G. Thwaites, A. A. McBean, H. T. Pitt, A. Dye, W. Cobb, W. H. Young, H. G. Alexander, H. A. Tracy, F. J. Hanbury, and J. Wilson Potter.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander), was awarded the society's Gold Medal for a magnificent group, each plant in which exhibited the highest degree of culture. Included were many choice hybrid varieties that have been raised at Westonbirt, and among these *Cattleya Hardyana* far surpassed in quality, the imported natural hybrid forms. At one end of the group was a noble specimen of *Cattleya Warszewiczii*, with 26 well-developed flowers, grown from a single imported plant; above it was a plant of *Miltonia vexillaria*, with 45 flowers, and another specimen of this species in the group had even a greater number. Plants of the Westonbirt form of *Cattleya* Lord Rothschild were also shown well, the large rose and crimson flowers having the greater part of their lips of a rich orange colour. This is said to last longer in bloom than almost any other *Cattleya*. *Lælio-Cattleya callistoglossa* Earl Grey had very fine rosy-lilac flowers, with the large and showy labellums entirely of a rich claret colour. At the back of the group, which was well arranged in a setting of green moss and *Adiantum* Ferns, were a number of light inflorescences of the spotted-lipped form of *Oncidium sarcodes*; also *O. pratense*, *O. Gardnerianum*, the white *Phalæopsis amabilis*, and *Odontoglossum Pescatorei*, with a branched spike of 63 flowers. In the front portion of the exhibit was a noble specimen of the large, white *Miltonia vexillaria* Queen Alexandra, with six flower spikes, bearing altogether 33 flowers, and a pan containing the charming reddish-crimson-coloured *Sonchro-Lælia læta* Orpetiana, with five flowers. Other

interesting Orchids noted were *Lælio-Cattleya* Clive, Westonbirt variety, a very large and beautiful flower; the new *Lælio-Cattleya* Caligula (C. Warszewiczii × L.-C. callistoglossum); *Brasso-Lælia* Helen, and some other *Brassavola* Digbyana hybrids; specially good *Lælio-Cattleya* callistoglossa, and further hybrids raised at Westonbirt, and included two fine novelties. (See Awards.)

Messrs. CHARLESWORTH & Co., Heaton, Bradford, were awarded a Silver Flora Medal for an interesting and varied group, which contained a good selection of uncommon species, including the singularly-formed *Bulbophyllum* Lobbii colossus; *Cynoches* Egertonianum, with a long raceme of curious flowers; *Oncidium* Waluewa, a graceful species with drooping sprays of pretty, cream-coloured flowers that have bars of a rose colour; *Odontoglossum* blandum, *Trichopilia* Turialva, *Oncidium* stramineum, *Stelis* tristyla, and other singular species. Among the showier flowering plants were *Odontoglossum* Pescatorei Golden Gem, with clear, canary-yellow flowers that have a darker yellow crest, which showed little departure from that of a typical flower of *O. Pescatorei*. Among the hybrids were the new and pretty *Lælio-Cattleya* Elba (L.-C. Ingramii × C. Warszewiczii), a very neat flower, with ruby-purple lip, and having the orange-coloured disc extended into two clear blotches, one on each side, as in C. Warszewiczii; L.-C. Mollie, with buff-tinted sepals and petals and ruby-claret lip, with an orange-coloured disc; *Odontoglossum* Rolfeae, &c.

Messrs. CRIPPS & SON, Tunbridge Wells Nurseries, Kent, were voted a Silver Flora Medal for a small but bright group of the brilliant scarlet *Disa grandiflora*, which they cultivate apparently with ease, although many expert gardeners fail to grow it satisfactorily. The plants were well furnished with flower-spikes, and in the aggregate there were some 70 or 80 flowers.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Banksian Medal for a group in which the principal novelty was the new hybrid *Odontoglossum* Memoria Lambeauizae, the result of crossing a remarkable plant which they exhibited at the Ghent Quinquennial show as *O. Prince Albert*, but which some considered to be a distinct and nearly black-sepalled form of *Odontoglossum* sceptrum, crossed with *O. Harryanum*. The new hybrid flowered for the first time from a small pseudo-bulb, and bore a spike of two flowers of great promise, and an advance in dark-coloured hybrid *Odontoglossums*. The flower in size and shape partakes much of *O. Harryanum*. The sepals are of a blackish-chocolate colour, with a slight whitish tip and base, and crossed with two thin, whitish, wavy lines. The petals are cream-white at the base, spotted with dark chocolate, the margin and outer half being blackish chocolate similar to the petals. The lip is broad, coloured pale primrose in front, spotted with purple at the base and around the dark yellow crest. Examples of uncommon and pretty species in the group were two good groups of *Aeropera* Loddigesii, several *Masdevallias*, the new white form of *Phaius maculatus*, several *Ancistrochilus* Thompsonianus, *Trigonidium* Amesianum, *Galeandra lacustris*, *Epidendrum rigidum*, *Eria acervata*, *Trichopilia marginata*, *Aerides expansum*, &c.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, gained a Silver Banksian Medal for a group composed of *Brasso-Cattleya* Digbyano-Warszewiczii, with very fine rose-coloured flowers with fringed lips; *Lælio-Cattleya* Vesta, with bronzy petals and purple lips; *Disa* Luna, a pretty hybrid, with rose-purple flowers; *Masdevallia* Imogen, and other *Masdevallias*; two plants of the showy yellow and rose-coloured *Sobralia Veitchii*; the scarlet *Cochlidia* Noezliana; *Cypripedium* Wiertzianum; *Oncidium leucochilum*, &c.

R. I. MEASURES, Esq., Camberwell (gr. Mr. Smith), received a Silver Banksian Medal for a group in which were *Maxillaria ochroleuca* (with many cream-white flowers), two specimens of *Cölogyne speciosa*, C. Massangeana, *Miltonia* vexillaria albens, *Lælio-Cattleya* Clive, *Cypripedium* Curtisii, Cambridge Lodge variety, several *Masdevallias*, and a pan of *Dossinia marmorata*. (See Awards.)

Messrs. HUGH LOW & Co., Enfield, showed *Cattleya* Gaskelliana alba, with four flowers; C. Gaskelliana Phyllis, with pale-rose flowers; and two good forms of *Odontoglossum* Pescatorei.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed an inflorescence of the rare *Cattleya Warszewiczii* saturata of fine colour, and in which the usual blotches of yellow on the lip are suppressed, the lip being wholly dark crimson-purple; also *Lælio-Cattleya* Henry Greenwood, Glebelands variety, a pretty light-coloured form.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Lælio-Cattleya* Clonia gigantea (L.-C. elegans Turneri × C. Warszewiczii), a brilliantly-coloured flower, with rose-coloured sepals, having the bronzy tint of L.-C. elegans, and broad, rose petals veined with rose-purple; the expanding, crimped front lobe of the lip and the tips of the side lobes are of a bright magenta-purple tint. The spikes bore three large flowers.

H. T. PITT, Esq., Rosslyn, Stamford Hill, exhibited the singular little *Oncidium pumilum* and *Dendrobium ciliatum annamense*, both well flowered.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent an inflorescence of the rare *Luëddemannia* Pescatorei, with wax-like, orange-coloured flowers and sepals of a coppery tint. A plant of this species, with an inflorescence 4 feet in length, was exhibited by Miss Willmott, June 12, 1906, and it was then awarded a Botanical Certificate.

AWARDS.

AWARDS OF MERIT.

Cattleya Waldemar (Whitei × *Dowiana aurea*), from Major G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A very pretty and distinct hybrid, with sepals and petals of a cream colour; tinged and flaked with rose; the broad, crimped labellum is blush-white and closely veined and marbled with varying shades of purple. The base is marked with clear, gold lines.

Cattleya Macanas var. *Thor* (superba × *Warszewiczii*).—In this charming hybrid the beauties of both parents are admirably blended. The sepals and petals are blush-rose colour; the front of the showy labellum is ruby-purple, the throat and disc white, with an orange band. The plant exhibited bore an inflorescence of six flowers.

Miltonia vexillaria, *Lambeau's* variety, from Monsieur LAMBEAU, Brussels.—The best and largest of the coloured forms, and of fine shape. The sepals and petals are coloured bright rose, with a white margin. Lip 4 inches across, bright purplish-rose, with darker veining, the base being white, with several red lines. The plant bore a well-developed spike.

Dossinia marmorata, from R. I. MEASURES, Esq., Camberwell (gr. Mr. Smith).—A species with large, velvety, green leaves that have bronze and gold-coloured veining. It is usually known in gardens as *Anætochilus* Lowii.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., and Messrs. W. Bates, Ed. Beckett, A. Dean, H. Parr, A. R. Allan, J. Davis, Geo. Kelf, Chas. Foster, Jno. Lyne, C. G. A. Nix, Geo. Reynolds, J. Jaques, H. Somers Rivers, P. C. M. Veitch, Owen Thomas, W. Poupart, and Jas. Vert.

Messrs. SUTTON & SONS, Reading, filled one side of a long table with an exhibit of culinary Peas, gathered from trial rows in their experimental grounds at Reading. The collection embraced over 50 varieties and about 20 seedlings, the latter being shown under numbers in a large glass case. The exhibit was noteworthy for the remarkable quality of the pods, each dish was shown in the best exhibition style, and the varieties were representative of the best in the various sections—early, late, dwarf, tall, &c. Of course, the display furnished no evidence of the cropping qualities of the individual varieties, nor their freedom from disease, &c., but, as seen, the finest were Early Giant, one of the best of the early-season kinds; Green Gem, Prizewinner (when opened the pods were found to contain 11 very large Peas); King Edward (the pods being full to almost overflowing; Little Marvel, and Harbinger, two good dwarf kinds; Selected Gladstone, Superlative (remarkably handsome pods of a deep-green colour); and World's Record. The manner of staging was pleasing, a dark velvet cloth being used as a

groundwork, with foils of palms and vases of flowers. The collection of seedlings contained many varieties of great promise. (Silver-Gilt Knightian Medal.)

Messrs. JAMES CARTER & Co., High Holborn, London, also showed an exhibit of Peas, in all some 250 varieties. This very large collection was from their trial ground at Mortlake, and as all were sown on the same date (March 27), it was of much educational value as demonstrating the season of each kind; some were yellow in the pod, and others were just forming their seeds. Attached to each dish was a label affording information as to the season, habit, &c., of the variety displayed. The manner of staging was effective, for interspersed in the group were vases of Sweet Peas, and arches filled with the same flowers were arranged down the centre of the table. The large pods of Quite Content were conspicuous, and quite the largest in this extensive display. Other varieties that were especially noticeable in this display were Duke of Albany, Duchess of York, Stratagem, Carter's Exhibition, Alderman, Gladstone, Dreadnought, New Model, Daisy, and Torpedo. Several seedlings of merit were also shown, and selected stocks of standard kinds. (Silver-Gilt Knightian Medal.)

Two further exhibits of Peas were shown by Messrs. G. W. KING & Co., Coggeshall, Essex, who showed 80 distinct varieties, all of which were sown on March 22 of this year, and Mr. WILLIAM DEAL, Brooklands, Kelvedon, Essex. Messrs. KING showed Quite Content, Alderman, Centenary, Gradus, Superlative, Glory of Devon, Stratagem, Prize-Winner, Abundance, &c. They also exhibited haulms of some varieties in fruit, amongst which was a new variety named The Jap, carrying a very large number of fine pods. (Silver Banksian Medal.) Mr. DEAL displayed Duke of Albany, Telephone, Sutton's Al, Essex Star, Masterpiece, and many other varieties of proved worth. (Silver Banksian Medal.)

Messrs. T. RIVERS & SON, Sawbridgeworth, showed a collection of Cherries from pot-grown trees. Of black kinds they had May Duke, Géante d'Heidelberg, Turkey Black Heart, Bigarreau Noir de Guben, Early Rivers (deep black), Bigarreau Noir de Schmidt (the largest fruits in the collection), Late Black Bigarreau, Black Tartarian, and of white kinds White Bigarreau, Emperor Francis, Guigne Choque, and Reine Hortense. The whole of the fruits were of exceptional quality. (Silver-Gilt Knightian Medal.)

Messrs. LAXTON BROS., Bedford, displayed boxes of Strawberries of the varieties Reliance and Progress. Both are late-season fruits, the former is a very fine-flavoured variety raised by crossing Vicomtesse H. de Thury with a seedling of the St. Joseph, or perpetual fruiting type. The flesh is firm and of splendid eating qualities. Messrs. LAXTON also showed a new Raspberry named Prosperity, and fruits of a Japanese Plum.

A large, yellow-fruited Tomato named Home-wood Favourite was shown. It much resembles the variety Golden Jubilee.

Mr. G. GODDARD, Norwood Green, Southall, showed young plants of Black Currant labelled Monarch. The small bushes were heavily fruited.

Mr. S. ATTRELL, North Common, Chailey, Sussex, exhibited canes of a new variety of Raspberry named Attrell's Magnum, that were carrying big clusters of large fruits.

AWARD OF MERIT.

Strawberry Fillebasket.—This variety was awarded this distinction after trial at Wisley. It is not new, and fruits were exhibited by the raisers, Messrs. LAXTON BROS., Bedford, at York Gala in 1900. We were unable to find any of the fruits after the committee had risen. The following is abridged from the raisers' description:—"Raised from 'Royal Sovereign' and 'Latest of All.' The colour is bright scarlet, similar to Royal Sovereign; the flesh is white and firm, with no hollowness in the centre; in size of fruit it is between its two parents; external skin glossy scarlet, and seeds set in shallow basins, making it a good traveller, of rich flavour. The cropping qualities are remarkable. The habit of the plant is compact and robust, leaves thick and leathery, resisting mildew."

NATIONAL CARNATION AND PICOTEE.

JULY 24.—This society held its annual exhibition on the above date at the Royal Horticultural Hall, Vincent Square, Westminster. The quality of the blooms was generally excellent, and the colours distinct and clear, a "run" flower being rare.

DRESSED FLOWERS.

In the class for 18 blooms, on cards, bizarres and flakes, the 1st prize was won by MARTIN R. SMITH, Esq., Hayes (gr. Mr. C. Blick). The varieties consisted of Consuelo, Norseman, Fra Diavolo, Zoedone, Gaylad, Mine Host, Isolde, Amyas Leigh, Algot, Phaeton, Emigrant, Carissima, Abbess, Shamrock, Silver Queen, Lord Macaulay, and Merry Lass. There were several weak and disfigured blooms in the 1st prize exhibit, but all were fairly large; 2nd, Mr. R. G. RUDD, Kings Norton, who had fine blooms of Master Fred, Guardsman, W. Shirving, Mrs. T. Lord, Gordon Lewis, Chas. Henwood, and Merton; 3rd, Mr. C. TURNER, Royal Nurseries, Slough, with good blooms of Chas. Henwood, Mrs. T. Lord, G. Herbert, G. Nesbit, &c.

Eighteen blooms of Self-coloured Carnations.—MARTIN R. SMITH, Esq., was again 1st, and this time easily, with very superior blooms of the following varieties, viz., Daffodil, Ashantee, Snowdrift, Sir Galahad, John Pope, Much the Miller, Lady Linlithgow, W. H. Parton, Bonnie Dundee, Fleur de Lis, Vesta, and Imogene; 2nd, Mr. R. G. RUDD, with Daffodil, Chancellor, Mrs. Eric Hambro, Mrs. R. C. Cartwright, Bridegroom, Benbow, and Captivation; 3rd, Mr. C. TURNER.

Fancy Varieties.—In the class for 18 Fancy flowers, in not fewer than 12 varieties, the 1st prize was won by MARTIN R. SMITH, Esq., with a very fine, showy lot of large, clear-coloured blooms. The back row consisted of The Skipper, Linksman, Sam Weller, Miss H. Thompson, and Bonnie Buchanan; Buboshes, Mohawk, and Mandarin were in the middle row; and in the front were Tattycoram, Seneca, and Rayon d'Or; 2nd, Mr. R. G. RUDD, with large blooms, but lacking generally in brilliancy. The finest examples were those labelled Voltaire, Sam Weller, Cavalier, Liberté, Sir Lancelot, John Sebright, and Le Beau; 3rd, Mr. C. TURNER.

White-ground Picotees.—The best 18 varieties were shown by Mr. R. G. RUDD, with perfect blooms that were nearly all of equal size. These were Cato, Miss Evelyn Cartwright, Fanny Tett, Amelia, Little Phil, Mrs. H. Hoskins, Lavinia, Favourite, Brunette, Mrs. Sharp, Mrs. Beswick, and Mrs. Openshaw; 2nd, MARTIN R. SMITH, Esq., whose blooms of Ariadne, Lavinia, Dolores, White Heather, Favourite, Lady Macbeth, and Snowdrop, were most meritorious; 3rd, Mr. C. TURNER.

Yellow-ground Picotees.—In the class for 18 yellow-ground Picotees, in not fewer than 12 varieties, the 1st prize was won by MARTIN R. SMITH, Esq., with an exceptional lot of blooms. We noticed, as especially good, Lady Gascoigne (a light-edged bloom), Sunbeam, Morgan le Fay, John Ruskin, Her Majesty, Ladybird, Ace of Trumps, Mithra, Leonora, Orby, and Mrs. W. Heriot; 2nd, Mr. R. G. RUDD, with Lucy Glitters, Lauzan, Mrs. W. Heriot, Calais, Cymbeline, Carlyle (a fine heavy-edged bloom), Dalkeith, and Cadogan.

UNDRESSED FLOWERS.

Mr. J. DOUGLAS, Great Bookham, won the 1st prize in the class for 12 varieties of Self-coloured Carnations. His flowers included such fine varieties as Apricot (a cerise pink), St. Peto (a rich purple), Trojan (white), Cupid (rose-pink), Daffodil, and Miss Willmott (rosy-scarlet). This last flower was selected as the premier Self flower in the show, the exhibitor being also the raiser; 2nd, Mr. R. G. RUDD, with varieties different to the foregoing. We noted Hermione, W. H. Parton, Mrs. Flight, Camilla (a rich rose-pink), and Capurnia (pinkish-buff colour); Mr. C. TURNER and MARTIN R. SMITH, Esq., were placed equal 3rd in this class.

Fancy Carnations.—The best blooms of undressed Fancies were shown by MARTIN R.

SMITH, Esq., in whose stand a bloom of Pacquin took 1st prize for an undressed Carnation. In the collection we noted grand blooms of Rayon d'Or, Hengist, Merlin, Sam Weller, Charlemagne, Keogh, Merriden, &c.; 2nd, Mr. J. DOUGLAS, among whose blooms the more distinct and novel coloured flowers were Nizam, Buchanan, Galilee, and Tintagel; 3rd, Mr. R. G. RUDD.

Picotees.—These were required to be shown in not fewer than 12 varieties; the 1st prize was won by Mr. MARTIN R. SMITH, with varieties similar to those we had noted in the previous competition, and mostly those which possess wire edges, Her Majesty being the best of the heavy edges; 2nd, Mr. R. G. RUDD, with well-chosen varieties that were rather small.

Twelve distinct varieties, including Selfs, Fancies, and Yellow Grounds.—The schedule required these to be shown in 12 vases, three blooms of each. The winner of the 1st prize was MARTIN R. SMITH, Esq.; 2nd, Mr. J. DOUGLAS; 3rd, Mr. R. G. RUDD. The method of showing the blooms in triplets was pleasing, and the flowers generally were of good quality.

Classes open to exhibitors in either the 1st or 2nd divisions of the schedule.—A class was provided for a stand of six blooms of any Self Carnation and in this the 1st prize was won by H. R. TAYLOR, Esq., Cheam (gr. Mr. J. Gilbert), his variety being Mrs. Eric Hambro; 2nd, MARTIN R. SMITH, Esq., with the same variety; 3rd, Mr. R. G. RUDD, with Sir Galahad.

Six blooms, dressed, of any Yellow or Buff Ground Fancy Carnation.—1st, Mr. R. G. RUDD, with very fine blooms of W. Pemberton.

Six blooms, dressed, of any Carnation other than Yellow or Buff Grounds.—All must be of one variety only. The 1st prize was awarded MARTIN R. SMITH, Esq., for very beautiful blooms of The Nizan; 2nd, Mr. R. G. RUDD, with Nellie.

Six blooms of any Yellow Ground Picotee.—1st, Messrs. PHILLIPS & TAYLOR, with Léonora; 2nd, MARTIN R. SMITH, Esq., with Lady Fremantle; 3rd, H. R. TAYLOR, Esq., with Pilgrim.

There were several exhibits in classes for undressed flowers, but nothing was shown that calls for comment.

Groups of Carnations.—Two groups were shown, and MARTIN R. SMITH, Esq., was placed 1st for a semi-circular group, 10 feet in longest diameter, consisting of only the finer varieties; Mr. H. LAKEMAN, Thornton Heath, Surrey, was 2nd. Mr. SMITH took the 1st prize for a dinner table set out with Picotees. He used a bowl and six small vases to display his flowers, and these occupied much of the table space.

The premier heavy-edged white-ground Picotee John Smith and premier light-edged white-ground Picotee Fortrose were both shown by H. R. TAYLOR, Esq., of Cheam, in his 1st prize exhibit in a class for 12 white ground flowers.

The premier rose-flaked and premier bizarre Carnations were shown by H. R. TAYLOR, Esq., in Merton and Robert Lord respectively.

Many of the exhibits from the previous day's exhibition remained in the Hall, and added greatly to the display as a whole.

SOUTHEND-ON-SEA HORTICULTURAL.

JULY 10.—The annual exhibition of this society was held on the foregoing date in the Palace Hotel, Southend-on-Sea. The show proved to be highly satisfactory as regards the quality and number of the exhibits, but, unfortunately, rain fell during the afternoon, and this affected the attendance of visitors.

Roses formed the most attractive feature of the exhibition, and these were arranged—as also were Sweet Peas—in one of the large ballrooms. The Winter Garden was rendered beautiful by groups of miscellaneous plants.

Roses.—In the class for 48 blooms of distinct varieties, Messrs. D. PRIOR & SON, Colchester, won the 1st prize with a grand display of large, well-shaped blooms, and they were followed by Messrs. F. CANT & CO., Colchester. The 1st prize stand included extra fine blooms of the varieties Caroline Testout, Captain Hayward, A. K. Williams, Marie Verdier, Gladys Hark-

ness, Bessie Brown, Magna Charta, Frau Karl Druschki, Countess of Caledon, Souvenir de Pierre Notting, and Duke of Edinburgh. The most prominent blooms in Messrs. F. CANT & CO.'s stand were those of Aimée Cochet (very fine) and Niphetos.

In the class for 18 Tea or Noisette blooms the positions of these two firms were reversed on the prize-list.

In the class for 12 distinct varieties, Messrs. PRIOR & SON beat Messrs. F. CANT & CO. Both these growers staged fine blooms.

Messrs. PRIOR & SON also had the best 12 blooms of one variety, in grand blooms of the variety Liberty. 2nd, Messrs. F. CANT & CO., with magnificent blooms of Frau Karl Druschki. Five exhibits were staged in this class, including a stand of good blooms of Mme. Wagram, shown by the Rev. F. R. BURNSIDE, Stambidge Rectory, Rochford.

AMATEUR CLASSES.

In the class for 36 distinct varieties of Roses, the Rev. J. H. PEMBERTON, Havering-Atte-Bower, was the only exhibitor. His flowers were of excellent quality, and included J. B. Clark, Lady Ashtown, Alice Lindsell, Mildred Grant, M. Hoste (a fine yellow), Ulrich Brunner, white Maman Cochet, and Frau Karl Druschki. This last-named bloom was awarded the National Rose Society's Silver Medal as being the best Hybrid Perpetual Rose in the show.

The Rev. J. H. PEMBERTON was again to the front in the class for nine distinct varieties of Roses, three blooms of each variety, with a meritorious array of blooms, including the varieties Frau Karl Druschki, Mrs. W. J. Grant, Caroline Testout, Mildred Grant, &c. 2nd, Mr. WAKELEY, whose example of White Maman Cochet was awarded the N.R. Society's Silver Medal offered for the best Hybrid Tea Rose in the show.

Mr. H. ROBINS had the best 18 blooms of Roses in distinct varieties; and the Rev. F. R. BURNSIDE was 1st for 12 distinct varieties, and for eight blooms of Teas or Noisettes in distinct varieties.

The classes provided for local growers were well contested, and the blooms staged were meritorious. The same remark applies to the ladies' classes for floral decorations.

Mr. W. G. HATCH, nurseryman and florist, Prittlewell, Southend-on-Sea, was awarded a Gold Medal for an effectively arranged group of miscellaneous plants. Mr. A. DAVEY, Leigh Nursery, Leigh-on-Sea, was granted a Silver-Gilt Medal for a similar but less effective arrangement.

A Silver Medal was awarded Mr. M. LONGMAN for a display of plants, &c.

Dr. G. F. JONES, J.P., Westcliff-on-Sea, was granted a Certificate of Merit for a collection of Cacti.

RAYLEIGH AND DISTRICT HORTICULTURAL.

JULY 17.—The seventh annual exhibition of the above society was held on this date under most favourable weather conditions. The attendance of visitors was satisfactory, and the show taken altogether was the best held by the society. The most successful exhibitors in the open classes and the classes confined to gentlemen's gardeners residing within 10 miles of Rayleigh, were Mr. A. Epps (gr. to Mrs. MILLER, Leigh-on-Sea), who won seven first and three second prizes; Mr. S. TAYLOR, Rayleigh; Mr. E. JACKSON, Rochford; and Mr. J. POLLY (gr. to A. CHAPMAN, Esq., Fairview, Rayleigh). The most successful exhibitors in the amateur classes were Mr. W. J. VICKERS (hon. sec.), who secured seven prizes, including four firsts, and Mr. W. A. VOSS with five firsts and four second prizes. In the ladies' classes, Mrs. DEVENISH was accorded first prize for a decorated dinner table. Mrs. TAYLOR had the best arranged wicker basket of cut flowers, as well as the most effectively composed bouquet and lady's spray.

In the class for a group of miscellaneous plants arranged for effect, Mr. DAVEY, Leigh-on-Sea, was awarded the 1st prize, and Mr. A. EPPS the 2nd prize. Mr. HAROLD H. BROWN, Clements Hall, Hawkwell, staged three stands of Roses, not for competition, but they were the best Roses in the show.

MARKETS.

COVENT GARDEN, July 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding, the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

REMARKS.—Cherries are now arriving from Kent in large quantities, but these fruits have been considerably damaged by the recent storms. A consignment of Trinidad or claret-coloured Bananas was received by Mr. H. Rides, of the Central Avenue, during the past week; they were of fine quality and in good condition. English Peaches are plentiful and their prices are very low. Home-grown Tomatoes are also cheaper. Strawberries can still be obtained, but the consignments are small. P. L., Covent Garden Market, July 24, 1907.

POTATOS.

Kents, 4s. 6d. to 6s.; Bedford's, 4s. to 5s.; Lincolns, 4s. to 5s.; Blacklands, 3s. 9d. to 4s. 3d. The rain which fell on Sunday and Monday has caused the consignments to be small. The demand for tubers is good, but prices have a slight downward tendency. J. D. C., Covent Garden, July 24, 1907.

COVENT GARDEN FLOWER MARKET.

The supplementary stands in the Jubilee market are now removed, and there are many empty stands in the new portion of the ordinary Flower market, yet some growers still have large supplies of useful plants. Fuchsias are still very good and supplies are likely to continue. Crassula coccinea has been very fine this season, the plants being dwarf and well flowered. The hybrid varieties which come into flower earlier than the species are now almost finished for the season. Dorothy Perkins and Lady Gay Roses are held by some to be almost identical, but the latter variety, seen at its best, is of the more deeper and more pleasing shade of colour. A few fairly good plants of Rose Hia-watha have been seen. Plants that are not quickly sold drop their petals, but the Flower market is one of the worst places for retaining flowering plants in a good condition, and the cause may not altogether be due to the variety, Zonal, show and Ivy-leaved Pelargoniums are still plentiful; also Marguerites in both white and yellow-flowered varieties. Other plants seen include Coreopsis, Chrysanthemum segetum, Verbena Miss Willmot, and Mignonette. Lobelia appears to be finished for the season, except the double-flowering variety, which is now better than ever.

CUT FLOWERS.

Hardy flowers are now a great feature; these include Poppies, Alstromerias, Coreopsis, Corn flowers (Centaurea cyanus) in several shades of colours, Altheas in white and crimson, and pink and white Saponaria. Asters are already arriving, chiefly from France. Sweet Peas are much overdone, and very many are left unsold. Roses vary, those of best quality sell fairly well. The blooms from the open show traces of damage caused by the bad weather. Carnations are still abundant. The yellow-flowered Sweet Sultan is good, except those flowers which have been cut when in a wet condition. All flowers of this class travel much better if the flowers are quite dry when cut and packed. Sprayers have come largely into use and many persons use them too freely on their flowers for transit. Liliums are not too plentiful. Lily of the Valley is still sufficiently abundant to meet all demands. Stale flowers deteriorate very quickly in vases, &c., and the buyers are then disappointed, and do not purchase cut flowers again unless on some special occasion. — A. H., Covent Garden, Wednesday, July 24, 1907.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 20, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was very fine, especially in the western districts where the amount of bright sunshine was much greater than in the east, and the air was consequently warmer. Thunder and lightning occurred in several parts of Ireland on Thursday, Friday and Saturday; on the last mentioned day it extended as far as Wales and the West of England. Lightning was seen at Ipswich on the evenings of the 15th and 18th.

The temperature was above the average generally, the excess amounting to 7° in Ireland N.W. and to nearly 8° in Scotland W. In Eng. and N.E., however, the excess was only 0·5°, while in England S. there was a deficit of 0·1°, and in England E. of 1·3°. The highest readings were mostly registered on Tuesday in Scotland, and later at the majority of stations in England and Ireland. In Scotland N. (at Lairg) the thermometer rose to 86°, and in Scotland W. and Ireland S. (at Killarney on Thursday) to 85°, while elsewhere the maxima varied from 84° in Scotland E. to 76° in Scotland N.E. During the latter days of the week, the maxima were below 60° at some stations in the east and north-east coasts of Britain. The lowest of the minima, which occurred, as a rule, rather late in the week, ranged from 40° in Scotland N. and England F. to 48° in England N.W. and the English Channel, and to 51° in Ireland.

The mean temperature of the sea. The water was much warmer than during the preceding week, the increase of temperature amounting to more than 4° in some places. The actual values for the week ranged from 61·7° at Eastbourne, 61·1° at Margate and Seaford, and about 60° on the north-west coast of Ireland and at Newquay, to 51·3° at Larkwick and to 50·8° at Wick.

The rainfall was below the average very generally. Over a large part of Great Britain the week was rainless.

The bright sunshine exceeded the average in all districts, the percentage of the possible duration ranging from 73° in the English Channel, 67° in England S.W., 58° in England S., and 57° in England N.W. to 42° in Scotland E., and to 35° in England N.E.

THE WEATHER IN WEST HERTS.

Week ending July 24.

The first five days of the week were very much cooler than the day temperatures have been for the time of year. The nights have been, as a rule, of about seasonable warmth. On the warmest day the temperature in the thermometer screen rose to 77°, which, although only about 6° higher than the average for the middle of July, is the highest reading as yet recorded here during the present summer. The day has been warmer than at any previous time this month, but is still 1° colder at 2 feet deep, and 2° colder at 1 foot deep, than is seasonable. After 10 dry days there came two wet ones, indeed, taking them together more rain fell than in any two consecutive days during the previous eight months, and yet the aggregate fall amounted to only 1½ inch. This heavy fall, which was deposited almost entirely during thunderstorms, restarted even the percolation course, which short grass is growing, through which no rainwater at all had come for over a month. The sun shone on an average for 14 hours a day, which is more than 14 hours a day short of the July average. On two days no sunshine at all was recorded. The weather has now been calm, or with very light airs, for a fortnight, the direction of the air currents being mostly south-east, the compass between north and east. The mean amount of moisture in the air at 3 p.m. exceeded a seasonal quantity for that hour by as much as 10 per cent.

Correction. In my previous report I said that the highest temperature of the week, 76°, was the warmest as yet recorded here this year, but I find that in the middle of May I registered 79°. E. M., Berkhamsted, July 24, 1907.

* * In our next issue we hope to publish the reports kindly furnished by our correspondents on the condition of the hardy fruit crops.

APPLE LEAVES: *W. E. M.* The leaves are not affected with any disease, but the tissue has been injured by chills when moisture was present on the surface.

BOOKS: *G. W. S.* *The Fruit Grower's Year Book* can be obtained from our publishing department, price 1s. 3d. free by post.—*Correspondent.* *Rock and Alpine Gardening* may be obtained from our publishing department, price 3s. 6d. post free. Owing to a printer's error the price was described as 8s. 6d. on p. 45 of the last issue.

CLEMATIS DYING: *G. H., Windermere.* The material you send is insufficient for correct determination of the cause of the complaint.

CUCUMBERS DISEASED: *D. D.* The foliage you send is affected with the "spot" disease, caused by a fungus *Cercospora melonis*. This is generally the result of growing the plants in a too moist atmosphere, using too much manure, and not providing sufficient ventilation. Spray every portion of earth in the house with Bordeaux mixture once a week from the first, even when there is no evidence of the disease. With persistent attention the disease can be stamped out; or, better, it can be prevented from appearing by spraying with sulphide of potassium, 2 ounces in 3 gallons of water in which 2 ounces of soft soap is dissolved. Infection can only take place on the under-surface of the leaf, hence this portion should be thoroughly wetted with the fungicide. Syringe with this solution every alternate day.

FIGS UNHEALTHY: *Elaph.* We have failed to discover any disease on your specimens; the unhealthy appearance is the result of some cultural defect.

GRAPES DISEASED: *T. C., W. M.* The berries are affected with the spot disease. See reply in our last issue to *F. G. B.*, p. 60.

LIST OF POPULAR HERBACEOUS PLANTS, &c.: *G. E.* You should have furnished us with some particulars of the position, area, &c. The perennials could be planted any time after August, or, by obtaining pot grown plants, the planting could be done at once. We do not advise the latter method for your purpose, however, and by waiting till September next—it is, of course, too late to expect any display this year whatever is done—larger plants would be available, and these would give a good display of flowers next year. *Perennial herbaceous plants:* *Coreopsis grandiflora*, *Gaillardia grandiflora*, *Erigeron speciosus superbus*, *Campanula persicifolia* var. *Moerheimii*, *C. p. alba coronata*, *C. p. "Newry Giant"*, *C. p. grandiflora*, *C. van Houttei*, *C. nobilis*, *Trollius "Orange Globe"*, *T. asiaticus*, *T. napellifolius*, *Iris Mrs. Chas Darwin*, *I. L'Innocence*, *I. Mme. Chereau*, *I. aurea*, *I. pallida*, *I. Dr. Bernice*, *I. gigantea*, *Aster acris*, *A. Amellus*, *A. ericoides*, *A. laevigatus*, *A. densus*, *A. arcturus*, *A. cordifolius*, *Pyrethrum roseum Hamlet*, *P. r. Mrs. Bateman Brown*, *P. r. Carl Vogt*, *P. r. J. N. Twerdy*, *P. r. Pericles*, *P. r. Ne Plus Ultra*, *Achillea alpina*, *A. ptarmica fl. pl.* and the variety *The Pearl*, *Lathyrus latifolius*, *Montbretia*, *Chelone barbatus Torreyi*, *Delphiniums* in variety, herbaceous *Phloxes*, including the varieties *Mrs. E. H. Jenkins*, *Etna* and *Wm Robinson*, *Helianthus multiflorus*, *Dianthus barbatus magnificus*, *Pinks* of several sorts, &c. If to the above you add the following bulbous rooted plants, the season of flowering would be greatly prolonged. Not all, however, of these should be planted in September, *Galtonia candicans*, Spanish *Iris* in variety, *Lilium tigrinum*, *L. croceum*, *L. candidum*, *Narcissus Emperor*, *N. Sir Watkin*, *N. princeps*, *N. Barrii-conspicua*, *N. poeticus ornatus*, *N. Empress*. Of these bulbous plants you should purchase six or a dozen of each to form a group; plant the bulbs 4 inches deep.

Of the Spanish *Iris*es, a hundred may be purchased for a small sum. The annuals should include *Mignonette*, *Godetia*, **Cornflowers* (*Centaurea cyanus*), *Candytuft*, *Sweet Sultan* (*Centaurea*), *Stocks*, *Marigold*, **Sweet Peas*, *Chrysanthemum*, *Salpiglossis*, *Nasturtium*, *Love-in-a-Mist* (*Nigella*), *Nemophila*, &c. Sowings of these should be made from March to May. The *Sweet Peas* and the *Cornflowers* marked thus * should be sown in February, or *Sweet Peas* could be sown in autumn.

MELON ROOTS KILLED: *G. B.* We suspect the injury has been caused by either wire worms or some insect pest that was introduced with the freshly-cut turves. Soil obtained from a pasture and intended for the cultivation of Melons and other plants in a glasshouse should be stacked for a period before being used.

NAMES OF FRUITS: *T. M.* The Gooseberries are badly grown fruits, and owing to their small size we cannot name them with any degree of certainty. They resemble the variety *Lancashire Lad*.—*A. B. H.* *Peach Dymond*.

NAMES OF PLANTS: *H. G. H.* 1, *Cupressus Lawsoniana*; 2, *C. pisifera* var. *plumosa*; 3, *Streptosolen Jamesoni*; 4, *Juniperus chinensis* var. *aurea*.—*F. C.* We do not undertake to name varieties of *Carnations* or other florists' flowers.—*Avonhurst.* We do not undertake the naming of *Roses*. The shrub is *Lycium Chinense*, the Tea Plant.—*T. W. C.* 1, *Dictamnus fraxinella*; 2, *Lychnis viscaria flore pleno*; 3, *Sedum Sieboldii*; 4, *Bambusa Fortunei variegata*.—*W.* *Coryanthes speciosa*.—*Mill Hill.* *Lapeyrusia cruenta*, more commonly known as *Anomatheca cruenta*. The spots on the *Begonia* foliage are caused probably by condensed moisture settling on the plants at night.—*P. H.* 1, *Masdevallia demissa*; 2, *Babiana sambucina*; 3, *Stelis ophioglossoides*; 4, *Epidendrum ochraceum*; 5, *Seraphytha multiflora*.—*Don.* *Agrostemma coronaria*.—*L. H.* 1, *Fuchsia procumbens*; 2, *Verbascum Thapsus*; 3, *Campanula rotundifolia alba*; 4, *Lapsana communis*; 5, *Phalaris canariensis*.—*J. W. W.* 1, *Robinia hispida*; *Erigeron philadelphicus*.

NECTARINES: *C. D.* The markings on the foliage are not due to fungus, but to a deposit of lime from the water with which they have been syringed. The cracking in the fruits is the result of some irregularity in watering the border, or to some defect in the drainage of the latter.—*Elaph.* The splitting of the fruits is caused by the presence of too much moisture at the roots.

PEONIES DISEASED: *E. B.* Your plants are affected with the drooping disease, caused by a fungus *Sclerotinia pæoniae*. Cut off the drooping stems and burn them. Early next spring remove the upper 2 inches of soil over the roots and afford fresh soil that has some quicklime mixed with it.

PEACH LEAVES INJURED: *G. H. B.* The markings on the foliage are caused by the shot-hole fungus—*Cercospora circumscissa*. Spray the trees with an ammoniacal solution of copper carbonate at intervals.

PEACHES ROTTING: *Correspondent.* The fruits on reaching us were a mass of pulp, and it was quite impossible to determine the nature of the trouble. The foliage received shows no trace of fungus disease.

PEAR LEAVES INJURED: *Leven.* The injury has been caused by the Pear-leaf blister mite. Spray the trees thoroughly with paraffin emulsion prepared by boiling together equal proportions of paraffin and soft soap. This should be thoroughly mixed with 25 times its bulk in water. Apply the spray in the autumn and again in the following spring, when the leaves are expanding.

PLANTS FOR SUPPLYING CUT FLOWERS: *T. H. S.* The following is a selection from the list given in our issue for February 10, 1906, p. 96:—*Roses*, *Carnations* and *Pinks*, *Campanulas*, herbaceous *Phloxes*, *Michaelmas Daisies*, *Sweet Peas*, and *Pyrethrum roseum*. We may also include *Dahlias* and any of the *Sun-flowers*, especially *Helianthus multiflorus*.

Any of the varieties mentioned in our previous reply will be found excellent garden plants. The *Chrysanthemums* enumerated are varieties of the hardy *C. maximum* and not the Japanese winter-flowering type. *Mrs. Head* is correct.

PLANTS OBSERVED AT KEW: *Amateur.* The *Petunias* noticed in the beds near to the main walk leading from Kew Green are the varieties *Superbissima* and *Inimitable*, the former having varied and spotted flowers, and the latter striped flowers. The *Poppies* growing in a bed near to the temperate house are varieties of *Papaver somniferum* (*Opium Poppy*). The variety *pæoniaeflorum* has double flowers. The *Convolvulus* near to the entrance to the grounds attached to the Queen's Cottage is *C. sylvaticus*, also known as *Calystegia sylvatica*. There is a form with pink flowers named *incarnata*.

PUBLIC PARKS EMPLOYMENT: *A Reader.* Your better plan will be to write to the superintendent of any of the parks you may prefer to work in, asking for a form of application. Almost all parks are provided with glass structures; some have very extensive and up-to-date plant houses and frames.

RHODODENDRONS DISEASED: *A. W.* The galls on the leaves are formed by a fungus—*Exobasidium rhododendri*. The spores of the fungus are not yet matured on your plants, so that if all the diseased leaves are collected and burnt the disease will not spread.

ROSES DISEASED: *D. Bros.* The foliage is attacked by the orange rust fungus *Phragmidium subcorticatum*. Spraying with diluted Bordeaux mixture or ammoniated carbonate of copper solution at intervals during summer will check the spread of the disease. Burn all the diseased leaves now and all fallen ones in the autumn.

STRAWBERRIES INJURED: *A. B. Bosworth.* The insect attacking your Strawberries is one of the millipedes, "the spotted snake millipede" (*Blanjulus guttulatus*). These generally feed on the roots of plants, but they are also fond of Strawberries. Straw or lawn mowings placed about the plants provides them with a convenient shelter. They may often be attracted from the roots of other plants by burying slices of Turnips, &c., but millipedes are especially fond of Strawberries and it is difficult to suggest what to do under the circumstances. Raising the fruits from the ground by means of wire or other supports would largely prevent this and other insect pests from attacking them, but it would be expensive and troublesome in the case of large beds. Perhaps the best thing to do would be to go over the beds and gather all the fruit that was infested and burn it. As soon as the fruits are all gathered collect and burn any infested fruits, rubbish, dead leaves, &c., on the beds.

URINE: *J. D. S.* Human urine contains a large proportion of ammonia, and is more than twice as rich in plant-food as pigs urine, one-third richer than cow's urine, but not so rich in this nitrogenous food as horse or sheep urine. It also contains some phosphates. The best plan for utilising this liquid is to put it into a tank or tub with all the household slops (suds but not grease), or with twice its bulk of common water. Allow it to stand for three or four days to ferment, then apply it during wet weather to Cabbages, Lettuce, Celery, Ferns, shrubs and fruit trees. It is not adapted for flowering plants, as it favours the development of foliage at the expense of flowers, which is the case with all manures that are strong in ammonia.

WARTS ON VINE LEAVES: *G. H. B.* The warty excrescences are due to a too luxuriant growth in the cellular tissue, brought about by an excessively moist and close atmosphere in the vinery. Ventilate more freely, and place less moisture about the house.

COMMUNICATIONS RECEIVED.—*E. H. J.*—*J. G. W.*—*Sir J. T. D. Ll.*—*Lord Avebury*—*A. D.*—*Lord B.*—*Lady Plowden*—*W. L.*—*W. H. C.*—*T. H.*—*S. T. W.*—*Sir W. V.*—*G. T. G.*, *Paris*—*W. A. THE COUNTRY GARDEN.

CONTINUING the subject of the wild garden as a desirable and decorative feature in the garden proper, I would remind my readers that the seeds of some of the best indigenous plants are obtainable from certain seedsmen. It should go far to facilitate their cultivation, for there is no method so conducive to beautiful effect as growing from seed, as it ensures, or should ensure, an ample supply of plants for the making of a broad effect.

Where the wild garden is large enough, it adds greatly to its interest, and that is much the same as saying, its beauty, to include a portion of wild rock-garden. It may well take the form of a sunny, sloping bank at one of its boundary limits; and a really effective and long-sustained display can be achieved by our native wildings alone. A broad stretch of Toad Flax makes a charming patch of clear yellow—it is one of the most decorative plants to use for a summer display. For the same season Campanula latifolia is an equally suitable subject; and besides this species may be included C. Trachelium, C. hederacea, and our wayside C. rotundifolia. There is almost as much daintiness and grace in the yellow-flowered and white-flowered Galium verum (Lady's Bed Straw) as there is in the popular garden Gypsophila; they grow in wide-spreading masses, and before the flowers appear the foliage has long been attractive with its gracefulness. Foxgloves and Mulleins are distinct and characteristic upstanding plants—upstanding, yet needing no artificial support, and that fact adds much to their charm. I have no hesitation in recommending these tall subjects for the wild rock garden, because a fair proportion of tall

plants adds much beauty. Another good subject is the yellow Loosestrife (Lysimachia vulgaris). It flowers in July, and will succeed with far less moisture than is generally known. So, for that matter, will the Purple Loosestrife (Lythrum salicaria), but these plants succeed better on the level or in a slightly dug-out position than where the drainage is sharper. In the case of the Purple Loosestrife, however, it is worth while to forego the wild species for the more brilliant variety L. s. superbum.

Wild plants of annual habit prolong the summer display, the Corn Marigold (Chrysanthemum segetum), and the blue Cornflower (Centaurea Cyanus), and even Red Weed or Poppy (Papaver Rheas) are not to be wholly despised. A charming evergreen plant of shrubby growth is the yellow Rock Rose (Helianthemum vulgare). It cannot have too sunny a position, and during its flowering season it forms a grand patch of colour. Ling (Calluna vulgaris) and Heather should be planted largely enough to form a conspicuous patch when in flower, and certainly ample space may be left for the Welsh Poppy (Meconopsis cambrica) and the Mountain Avenas (Dryas octopetala). The Welsh Poppy flowers well when exposed to a minimum of sunshine, and under fairly dense shade. I look upon it as one of the invaluable plants for a shaded position, especially if planted in a site with a north aspect. Among the more characteristic plants suitable for carpeting a rockery may be mentioned Saxifraga oppositifolia, S. hypnoides, S. granulata, S. umbrosa, and S. aizoides; Sedums of such species as S. anglicum, S. reflexum, S. acre, S. album, S. Telephium, and the charming old-fashioned native Sempervivums; to these may be added the Thrifts (Armeria), Thymes, Sandworts (Arenaria), and the varieties of brilliantly-coloured wild Dianthus.

There is, however, no need to give an exhaustive list, but I may add that a touch of blue colouring, especially in summer time, is attractive, and, perhaps, is best achieved in Echium vulgare, Succory (Cichorium Intybus), and Veronica spicata. Both Echium vulgare and the Succory are best grown in poor soil; indeed, the former will flourish in gravel, and, as to Veronica spicata, it is one of the showiest of rock-loving plants. Besides these there is the annual Cornflower already mentioned.

Other native plants often found in gardens, and that are really pleasing, are Valerian, Tansy (Tanacetum vulgare), and Cranesbill (Geranium). So much for the wild rock garden, and I cannot help thinking that even a small portion uninvaded by plants of alien birth has a peculiar interest if well and effectively planted. Some of our native plants improve wonderfully under garden cultivation, and when this is the case, it is highly interesting to grow such plants from seeds, and to watch the results.

I have not yet touched on the subject of introducing alien plants into portions of the wild garden other than the rockwork portion. It is a subject that needs the most careful consideration. The inclusion of plants that seem to have bed or border stamped upon them, that is to say, have nothing in common with the wildings with which they are to be associated, is hopelessly to mar the general effect. But there are numbers of plants that can be introduced in the wild garden with no sense of incongruity. Among these I would mention the handsome Heracleum giganteum, almost any varieties of Solidago (Golden Rod), Linaria dalmatica, and any of the other Linarias, the Polemoniums; such of the Geraniums as G. ibericum, G. Grevilleanum, &c., many of the Spiræas, and the herbaceous Veronicas. I have always found it a good test of suitability for a plant to possess some allied species in our native flora. Thus it appears

to me, that such a plant as Anthemis tinctoria is perfectly in keeping in the wild garden, but a Helianthus would appear out of place, and so would a Gladiolus. The main thing in planting a wild garden, so far as the introduction of alien plants is concerned, is to satisfy one's sense of the fitness of the subject for its surroundings. *Practical Gardener.*

NEW OR NOTEWORTHY PLANTS.

FELICIA (AGATHÆA) PETIOLATA.

THIS species is a new introduction to cultivation. It was first described by Harvey in his *Thesaurus Capensis*, vol. ii., p. 35, t. 154, as *Aster petiolatus*, and under this name is included in Harvey and Sonder's *Flora Capensis*, vol. iii., p. 80. The material on which Harvey founded the species was collected by Mr. Thomas Cooper in Basutoland and the District of Albert in 1861, since which time it appears to have altogether escaped notice until M. Dieterlin recently sent a specimen from Basutoland to the Montpellier Botanic Garden. The plant has pendulous or procumbent slender pubescent stems 1-2 feet long, or sometimes longer, which, as described by Mr. Cooper, hang in festoons over the edges of precipices. The shortly-stalked, ovate, pubescent leaves are $\frac{3}{4}$ -1 inch long, acute, and two or three-toothed on each side. The plant is free-flowering, and the heads are $\frac{3}{4}$ -1 inch across, solitary on slender peduncles about 2 inches long; the ray-florets are of rosy-purple colour, and the disc florets yellow. Following Bentham and Hooker's *Genera Plantarum*, the plant should be regarded as a Felicia, depending chiefly on the characteristic feature of this genus, namely, a one-seriate pappus, while in *Aster* the pappus is two or three-seriate. From the well-known *Agathæa cœlestis* (or *amelloides*) it is easily distinguished, among other characters by its procumbent or pendulous stems and its alternate, toothed leaves.

The illustration at fig. 34 has been prepared from fresh material kindly sent us by M. F. Denis, Balarac les Bains, Herault, France, who writes as follows:—"The Montpellier Botanical Institute in 1903 received some dried plants from Basutoland from M. Dieterlin. M. Daveau, Curator of the Botanic Garden here, who examined these, noticed an interesting composite, which bore only its native name of *Ketolice es Rhaba*. He provisionally identified it with *Agathæa* (*Aster*) *petiolata* (Harvey and Sonder).

"The specimen bore several ripe seeds, which were sown in 1904. One of the seedlings which sprang up was put in a composite border, and another in a small rockery exposed to full sunshine and quite unsheltered. The first plant was killed by frost early in the winter, the second lived for three winters with no protection, and is in excellent condition, although on several occasions the temperature of the atmosphere fell below 10°C. I have three plants raised from cuttings given to me by M. Daveau, which survived last winter perfectly. The plant may therefore be considered to be hardy in the climate of Montpellier, and so, probably, in England also.

"The plant has a creeping habit, and rapidly spreads its long flagelliform branches, which root freely. It is very floriferous, and its pretty mauve flowers are rather smaller than those of *Agathæa amelloides*, and are open the greater part of the year. The plant requires no special kind of soil, and it can be easily increased from cuttings or seed. If any readers of the *Gardeners' Chronicle* wish to cultivate the plant, I have some seeds which were gathered this year in our Botanic Garden at Montpellier."

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Newly-imported plants of Cypripediums, including *C. niveum*, *C. concolor*, *C. bellatulum*, *C. Godefroyæ*, and its variety *leucochilum*, invariably thrive and flower well for several years after their introduction if left undisturbed, but when it becomes necessary to repot them, or to disturb them at their roots in any way, they do not as a rule appreciate the operation. Therefore, unless a shift is absolutely needful, it is better not to repot them, but rather to pick out a portion of the decayed material, and to refill the spaces with fresh compost. Plants that must, from various causes, be repotted, should now receive attention, and those which are well rooted will require exceptional care, because the roots, being of a very brittle nature, frequently snap off by the merest touch. The pot in which the plant is growing should be gently broken round, and the pieces of crock that formed the drainage material carefully removed. Some roots may adhere to these potsherds, and they should be detached with the thin blade of a penknife, but should there be the least fear of breaking a root, it is better to leave it adhering to the crock rather than to break it in attempting to remove it. If the drainage be permeated with roots, do not interfere with it, but place the whole mass into a larger pot or pan, whichever may be preferred, and fill up to the level of the old drainage with fresh crocks and pieces of broken bricks. I have grown these plants in several kinds of compost, and have succeeded best with the following mixture:—Two-thirds fibrous loam, one-sixth coarse leaf-soil, and one-sixth small brick-rubbish. In repotting, keep the base of the leaves on a level with the rim of the pot, make the drainage secure with the roughest of the compost, and press the latter down firmly around the base of the plant, leaving sufficient space for watering. These species thrive best when suspended from the roof of the Cattleya house. *C. niveum* and *C. concolor* require a plentiful supply of water the whole year round. Instead of watering them in the usual manner with a can, dip them in a pail of water half-way up to the rims of the pots. A watering in this manner about once a week will be generally sufficient. The other species mentioned do not require so much water at their roots as is needed by these two species.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. Thomson Paton, Esq., Norwood, Alloa, Clackmannanshire.

Vineries.—The fruits of Black Hamburg and Madresfield Court Grapes are now rapidly colouring, and the vinery should, therefore, be kept cool by opening both the top and the bottom ventilators to their fullest extent during the day time, and allowing the top ventilators to remain open for a space of 6 or 8 inches and the bottom ones a trifle only during the night time. Allow a little heat to circulate in the pipes at night time, and also on wet, cold days, for this will ensure a circulation of fresh, dry air that is essential to the best colouring of Grapes. On bright, sunny days it is advisable to shade the bunches unless they are well protected by the foliage. A suitable shading material is one composed of 2 lb. of whiting mixed in a pail of water. Syringe this substance on to the glass of the roof in the morning as soon as the moisture has evaporated from the glass. The fruit of the varieties Black Hamburg and Madresfield Court finish best under cool conditions. When the temperature in the vinery reaches 100° or more, and the direct rays of the sun shine on the bunches, the berries of any variety of Grape will surely be disfigured. Test the borders with the soil tester, and if the soil is found to be dry afford a surface watering, and afterwards apply a mulching, unless the border is already covered with litter. This should afford sufficient water at the roots until the end of the season. Guard against attacks of red spider on the foliage, and see that wasps and flies do not damage the ripened berries.

Pot vines intended for fruiting again next year, should have well-ripened shoots by the beginning of August. The canes should be fully exposed to the sunshine and be allowed a free cir-

culatation of air about them. If they continue to grow freely when they should be ripening their shoots, remove them to the open and tie their shoots to a trellis. Do not expose them to cold winds, for these would cripple the foliage.

swell; and whether planted in pots, or in confined borders, the roots must be well supplied with moisture, and be fed with manure water once a week. A handful of fine grade vine manure, well mixed in three gallons of water,

FIG. 34.—FELICIA (AGATHÆA) PETIOLATA: COLOUR OF RAY FLORETS ROSY-PURPLE; DISC FLORETS, YELLOW. (For text see page 81.)

Apply water very carefully, and give a little weak manure water occasionally, for this stimulant will help them to mature their buds.

FIGS.—As soon as the first crop of these fruits is gathered, the second crop will commence to

will be beneficial to the formation of the fruits. Cut out superfluous growths, and allow a maximum amount of light and air to reach the fruit and foliage. Guard against insect pests by syringing with clear water twice daily.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton,
East Devon.

Plum.—The local crops of this fruit are heavy, and thinning has been necessary in the case of trained trees on walls, &c. Such varieties as Early Rivers, Orleans, Early Prolific, and The Czar will require protection from the birds as soon as they show signs of colouring. Wash the foliage of wall trees with a strong hosing by means of the garden engine: this will remove much dirt and rubbish that is apt to collect behind the branches. Syringe the foliage of late varieties, if the leaves are infested with aphids or red spider, with a suitable insecticide.

Raspberries.—After the fruits have been gathered, cut out all the old fruiting canes, in order that the sun and air may reach the young rods and thus greatly aid their ripening. It may also be found necessary to reduce the number of new growths, especially if this was overlooked earlier in the season. The mulching applied some few weeks ago is now exhausted of its manurial properties, and should be replenished with some good manure. The remaining canes should be loosely tied to the wires or poles, to prevent the wind from twisting them off at their bases: the final training must be deferred until the winter.

Fruit trees on walls require frequent attention in the matter of training the growing shoots to the trellis or wall; if this is persistently practised, the fruits will receive all the benefit of air and sunlight. Peach and Nectarine trees have both made rapid growth. The fruits of early varieties must be examined each day, in order to gather those that will part freely from the tree. Continue to syringe with clear water trees of late-fruited varieties, and do not neglect to furnish ample moisture at the roots now that the fruits are swelling.

Apricots.—In gathering early fruits, exercise great care, as they are easily damaged. It is not often that birds interfere with Apricots in these gardens, but a watch must be kept as the Apricots ripen, and if the fruits are molested the trees must be netted. Set traps for earwigs, as advised in the Calendar for July 20.

THE FLOWER GARDEN.

By A. C. BARILETT, Gardener to Mrs. FORD, Pencarrow,
Cornwall.

Herbaceous flowering plants.—Continue to stake and tie all plants which need support, as often as may be necessary. Care and judgment must be exercised in respect to such subjects as Michaelmas Daisies that they are not tied together too tightly, and so present a bunched-up appearance, thus destroying that free, graceful habit which is one of the charms of these plants. Lilliums and all plants with stout stems will need a stake to each stem. The stake should be placed behind the stem, and be as inconspicuous as possible. Although the appearance of the border of herbaceous plants is greatly enhanced when the dwarf, creeping plants at the front are allowed to ramble beyond the strict confines of the border, yet when the edge is composed of clipped Box, these front row plants must not be allowed to cover the Box edging for more than a few weeks, or portions of the Box will be killed outright. Frequent hoeing and weeding are now necessary to keep the borders clean. As the earlier flowering plants ripen their foliage, it may be cut away; the time has come for so dealing with the Pæonies, and the gaps thus made should be filled with annuals or other plants, the preparation of which was recently advised. These plants should be lifted carefully, and after they have been re-planted, be afforded a good watering, and provided with shade during sunny weather.

Roses.—As the flowers fade, they should be cut off, so that the strength of the plant will not be exhausted in the forming of seeds. Continue to syringe Rose plants with an infusion of quassia chips to prevent green fly establishing itself on the shoots. Some manurial assistance is very beneficial to Roses at this period, and where the beds are carpeted with Violas, or other dwarf plants, more water will be needed than is the case where the beds are reserved for Roses alone, and a mulch has been applied.

Sweet Peas now require longer sticks. The faded flowers must be daily removed, for if the plants are allowed to produce seed, the supply of flowers will cease. If not already done, lay a mulch along each side of the rows to conserve the moisture in the soil.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq.,
Eastwell Park, Kent.

Perpetual-flowering Begonias.—The charming variety known as President Carnot being ever green, and of a very robust habit, is specially suited for training on upright pillars, or on wires under the roof-glass. The latter situation is probably best of all, as the large pendulous clusters of rich carmine-coloured flowers show to great advantage in such a position. A warm or intermediate house is the most suitable for this class of Begonia, and when once established the plants will flourish for a considerable time, needing very little attention beyond the cutting out of the old growths in spring and occasionally thinning out the young shoots. In the operation of potting, employ a compost consisting of equal parts turfy loam, rough leaf soil, and manure from a spent mushroom-bed. Other good varieties suitable for growing in the same conditions are B. fuchsoides and B. coccinea. B. fuchsoides has small, bright coral-red coloured flowers, which are produced in great profusion; coccinea has a larger habit in both leaf and flower, the bloom being produced in panicles similar to those of President Carnot, but of a more vivid colour. These are strong-growing varieties, and they succeed better when planted out in a border than when the roots are confined to pots. Keep a careful look out for "rust," small thrips, fly, and other pests. A mild fumigation at regular intervals will be the best preventive.

Primulas.—Repot the early batches as this becomes necessary, using a light porous compost containing plenty of sand. Large pots are not necessary, those of medium sizes being generally most useful. If, however, large specimens are required, strong plants of the P. stellata type will make good specimens in 8-inch pots, and if well cultivated will become perfect pyramids of bloom in the winter and early spring months. Later batches of seedlings should be carefully pricked off into very light soil as soon as they are large enough, not allowing them to become "drawn" in the seed-pan. P. x kewensis is a useful hybrid, which makes a good companion to P. obconica, requiring the same cultural conditions; its clear yellow flowers are very attractive, and the plants continue in bloom for months together.

Cinerarias.—Repot the plants before they become pot-bound, remembering that Cinerarias are liable to suffer greater harm from this cause than most plants. After repotting the plants replace them on an ash bottom in a frame; and it will be better if the frame is situated behind a partially shaded wall; in any case the plants will need shade during the hottest part of the day. For potting, use good loam, leaf-soil and well rotted manure in equal proportions. When the plants have been potted for the last time and have filled the pots with roots, applications of weak manure water should be afforded them, alternating these with soot-water. Green-fly must be fought unceasingly, Cinerarias being particularly susceptible to attacks from this pest.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

Turnips.—No time should now be lost before making the final sowing of Turnip seed, for raising a crop for use during late autumn and winter. Although the bulk of this sowing should consist of the hardy varieties such as Green Top and Chirk Castle, if the present supply is at all scant a few rows of early Snowball will prove very useful. The ground intended for Turnips should be richly manured, and the manure should be kept close to the surface—to promote a quick growth, whilst the plants are young—thus assisting them the better to withstand the attacks of the fly which in some districts, and in some seasons, proves so fatal to Turnip crops. A light sprinkling of soot applied overhead when the plants are damp will check this pest if used as soon as the attack is observed.

Parsley.—If sowings have not already been made for raising Parsley for use during winter and early in spring, the work should be given attention without delay. Two of the most decorative and hardy varieties are Ex Ex Garnishing and Imperial Curled. The ground should already have been well prepared. In cold districts the seed should be sown in short drills, that the plants may be given the protection of some old glass "lights" during severe weather in winter, and when a fall of snow is expected.

Autumn-sown Onions.—With the object of checking top-growth and diverting the strength more into the bulbs, the necks of these plants should now be twisted, or bent down with the back of a wooden rake. This will also allow the light and air to reach the bulbs more easily.

Peas.—The early and second early crops of Peas being now past, the plants should be cleared off the ground, and the sticks may be again utilised for the plants raised from the latest sowings. The ground thus cleared may be prepared for the planting of Cabbages. It will be all the better for being prepared some time before it is required for use. These remarks will also apply to the ground on which it is intended to sow the Onion seed during the present month.

Early Potatoes.—These should now be lifted, particularly those that have Cauliflowers or winter Greens planted between the rows. If the tubers can be suitably stored, there is nothing to be gained by leaving them longer in the ground.

PUBLIC PARKS AND GARDENS.

By W. W. PETHIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

The August Bank Holiday.—This holiday, for various reasons, is usually the busiest day of all the year in the majority of British public parks. Being practically the last national holiday of the year suitable for the enjoyment of out-of-door amusements and sight-seeing, it is invariably taken advantage of by all classes of the community. Many of the excursionists who flock into all large towns and cities on that day naturally find their way to the public parks and open spaces, where there is plenty of room and ample freedom for families to enjoy themselves at little or no cost. Although nominally the first Monday in August is the holiday, the whole week is generally given up to holiday-making, thus causing popular parks to be filled with visitors the whole time. At such seasons it is found necessary to greatly increase the staff of park police, as more wilful damage is often done during holidays than at any other period of the year. It is undoubtedly false economy to forbear from putting on extra men, even at an enhanced wage, during holiday time.

Special amusements.—Since the average visitor out for the day soon tires of walking about the parks admiring the trees, flowers, and grass swards, it is well for the authorities to provide some special amusements and attractions suitable to the occasion. Where the power exists to make charges, well-organised entertainments not only help visitors to spend a pleasant day, but considerably assist in filling the coffers of the department. Some park authorities, where they have ground suitable for the purpose, promote athletic sports, from which they reap a rich harvest; others hold flower shows, while nearly all provide a number of bands. Parks which make provisions for such games as bowls, quoits, croquet and tennis, or offer facilities for cricket and other open-air sports, help great numbers of visitors to pass the time pleasantly either as onlookers or participants in the various games. The more that can be done in any of the directions indicated, the better will it eventually be for the public.

Work of clearing-up.—A public park after a general holiday in summer is usually a sorry sight, with trampled lawns and every space freely littered with paper, banana skins, and other refuse. Notwithstanding the presence of refuse boxes and baskets and the existence of stringent by-laws on the subject, the freedom of the British holiday-maker in his method of disposing of his paper bags, newspapers, &c., cannot be restrained. Under these circumstances, it is not surprising that park officials are invariably relieved when August Bank Holiday week is over, and matters once more assume their normal condition.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP;
AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 50.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER, 41, Wellington Street, Covent Garden, W.C.**

Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR, 41, Wellington Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

THURSDAY, AUGUST 22—Aberdeen Fl. Sh. (3 days)

FRIDAY, AUGUST 23—
Roy. Bot. Soc. meet.
Rose Sh. in Manchester Botanic Gdns.

FRIDAY, AUGUST 30—East Kilbride Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.4

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, July 31 (6 P.M.): Max. 66°; Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 1 (10 A.M.): Bar. 30.0; Temp., 62°; Weather—Bright sunshine.

PROVINCES.—Wednesday, July 31 (6 P.M.): Max. 62°; Cambridge; Min. 51°; Scotland, N.E.

The Fruit Crops.

In presenting our annual report on the condition of the hardy fruit crops it is satisfactory to be able to state that the crops are not likely to be less than the average, or inferior to those obtained last season. The weather since April has been so unseasonable, and the temperature of the atmosphere so much below that which is normal, it would not have been surprising had the return proved of a somewhat depressing character. It is partly for these reasons that we regard the present crops as satisfactory. The weather will always continue the determining factor in the cultivation of hardy fruits, and it is to some condition of the weather at a particular time that success or failure may generally be attributed. The cultivator can do much to

deserve success, by exercising care in the selection of a proper situation for the trees, by thoroughly preparing the soil before the work of planting is commenced, by carefully determining the most suitable varieties for particular districts, seeing that such trees are purchased as have been grafted on to the best stocks, and that skilful management is brought to bear on the trees. He can employ means for preserving the trees from insect and fungus attacks, and in some cases, but not all, it is within his power to afford artificial waterings during periods of drought, and manures to soils known to be deficient in plant foods. But after all has been done that is possible in our present state of knowledge, the cultivator cannot command success. This most desirable result can only be achieved after the gardener has done his part skilfully and faithfully, and the conditions of the weather during critical periods in the development of the trees are favourable. Thus it is that on occasions such as this our thoughts are taken back to the spring of the year, and we recall the condition of the trees at the stage when the buds were beginning to burst, and the brightest hopes were entertained in respect to the future crops. At that particular time this season the fruit trees were, in the words of many of our correspondents, "full of promise." The month of September in last year was remarkable for high atmospheric temperatures and brilliant sunshine, conditions which may have had something to do with the production of a rich supply of flower buds on the trees. The observations to be published in subsequent issues, and furnished by contributors to the report, are almost unanimous in stating that the trees blossomed with great freedom. Only one or two reporters state that owing to the production of heavy crops last year the trees failed to flower this season so well as could have been desired.

We think that it is the case also that fewer blossoms were destroyed by late frosts than is often the case in this country, and that the comparative failure of the Apple crop is attributable to low atmospheric temperatures, and cold winds, which prevailed for long periods together, and to the extraordinary lack of sunshine experienced during the months of May and June. But if these conditions have brought about a deficient Apple crop, they have not so greatly affected Pears, whilst Plums are much above an average crop.

If we consider the crops in detail we find that, concerning the Apple crop in Scotland,

out of forty-six returns, twenty-six report the crop as being under the average, whilst sixteen report average crops, and in only four cases are they described as more than average. In England, out of 187 returns, there are 122 reported under the average, whilst only sixty-five report crops up to, or above, the average. In Wales eleven correspondents report that the crop is under the average, and in not a single case is it described as more than average. In Ireland the conditions are worse than in England, Scotland, or Wales, for out of twenty returns there are fifteen which report the crop as under the average.

The Apple crop, therefore, over all the country is of less value than last year, and readers may see this for themselves by comparing the grand summary for the present season with that for 1906, which we have reproduced for this purpose.

Pears are variable, being less scarce in England than they were last year, but not so in Scotland. Out of forty-four returns from Scotland, thirty-two report the crop as under the average, and in only one instance is it reported as above the average. In England, among 186 returns there are seventy-one under average, and the rest all report the crop as average or above average. In Wales nine out of twenty-one reporters, and in Ireland eleven out of the same number, state the crop to be under the average.

Plums are much more abundant than usual in most parts of England, and in Scotland, but the crop in Wales and Ireland is not so plentiful. Out of forty-four returns from Scotland only twelve report the crop as being under the average, whilst in thirty-two instances it is described as equal to, or above, the average. In England, out of 186 returns, ninety-two report the crop as being above the average, sixty-seven as equal to the average, and only twenty-seven as deficient.

Cherries are a good crop in most parts of the country, being much above the average, and the same remark applies with even greater force to Peaches and Apricots. The soft fruits, such as Gooseberries, Currants, and Raspberries, grouped together under the term "small" fruits, appear less liable to miss cropping than Apples, Plums, or Pears, and reference to the returns published in these pages for some years past will show that, as a rule, the crops of small fruits have been good. But this year they are certainly above the average, for in England, out of 187 returns, all but four report average crops or crops above the average. The returns in respect to Strawberries appear fairly satisfactory in the report, but we are afraid that

NEW SWEET PEAS WHICH RECEIVED AWARDS OF MERIT AT THE NATIONAL
SWEET PEA SOCIETY'S SHOW ON JULY 16, 1907.

the crop generally was not equal to the average, although it lasted for a longer period than usual. Owing to the lack of sunshine the earlier fruits ripened but very slowly, and many decayed during the process. At the best, the fruits were of inferior flavour.

Reviewing, therefore, the details to which we have just referred, and bearing in mind that Apricots, Peaches, Cherries, Plums, Raspberries, Gooseberries, and Currants are plentiful crops, also that Pears are less scarce than they were last year, the fruit crops of 1907 cannot fairly be described as unsatisfactory, notwithstanding that the most important crop, that of Apples, is below the average. Full crops of all kinds of hardy fruits cannot be reasonably expected in any season, for they are seldom, if ever, obtainable.

We thank our correspondents for the information so freely accorded; in most instances it has been contributed by cultivators who have reported on the subject for many years past, and who are therefore the best able to furnish comparative estimates.

OUR SUPPLEMENTARY ILLUSTRATION.—In our issue for July 20 a supplementary illustration was given of a scene in the gardens attached to the Villa d' Este, near Rome, and an account of these gardens was contributed by Mr. JAMES HUDSON, gardener to Mr. Leopold de Rothschild, at Gunnersbury House, Acton. The supplementary illustration to the present issue affords another view in the same gardens, with the Villa showing in the background. Mr. HUDSON describes the gardens as capable of affording a delightful retreat during the hot, dry, Italian summer, and this may well be imagined when viewing the illustration of the series of water-terraces, that are fed by the cascade seen in the background. The Villa itself is said to be one of the finest examples of architecture of the Renaissance period.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees will be held in the Society's hall, Vincent Square, Westminster, on Tuesday, August 6. At the afternoon meeting a lecture on Water Lilies will be delivered by Mr. ARTHUR BEDFORD.

SIR JOSEPH HOOKER AND THE ROYAL HORTICULTURAL SOCIETY.—The following letter from Sir JOSEPH HOOKER, O.M., to Sir TREVOR LAWRENCE, in reply to the congratulations of the Royal Horticultural Society on the occasion of his 90th birthday, appeared in the *Times* for July 29:—"The Camp, Sunningdale, July 15, 1907. My dear Sir Trevor,—Your letter of the 25th June conveying the hearty congratulations of the President, Council, and Fellows of the Royal Horticultural Society on the approach of my 90th birthday has gratified me more than I can express. It is not by many times the first instance I have experienced of the friendly and all too liberal estimate of my labours in the cause of horticulture that the society has entertained. It has been a source of great regret that I was obliged, when resigning my post of chairman of the Scientific Committee, to abandon all hope of attending our meetings on account of having to devote my energies to the Directorship of Kew, and to the completion of labours on botanical works I have in progress. I had also to endeavour to overtake arrears of work extending over many years, which are still far from being overtaken. As a botanist I have hereby lost much, for since the days of David Douglas, the Royal Horticultural Society has contributed more for botanical science, as repre-

sented by collections, publications, and experimental research, than any other establishment in Europe. I have now to request you as their president to accept yourself, and convey to the council and to my fellow-members, my pride and gratitude for this most welcome evidence of their friendship and esteem. With every good wish for the continued welfare and renown of the society,—Believe me, dear Sir Trevor, sincerely yours, JOS. D. HOOKER."

GERMAN NURSERYMEN'S ASSOCIATION.—About a year ago the project of the formation of a confederation of nurserymen was brought forward by the Hon. H. MÜLLER, nurseryman at Langsur, and president of the Club of Rhenish nurserymen. Since that time the representatives of the nursery interests have not been allowed to rest, but it has been repeatedly referred to in the German horticultural Press, and the views of the Hon. MÜLLER, and other nurserymen, have been made public with the result that the project has taken a definite shape, and at the Mannheim exhibition, where many members of the trade were present, it was decided to form an association with the Hon. MÜLLER as president; a statement of the proceedings will shortly be published. The next meeting will take place at Eisenach in 1908. The matters that will be the first to be discussed are railway tariffs for the dispatch of nursery productions; means by which business expenditure, in view of the rise in wages, can best be reduced; tax on imports; unity in prices for certain plants, and their size and form, as for example Roses, avenue trees, ornamental shrubs, &c.; and the existing stocks of these. The principle of the "Open Door" will also come under discussion, and on this point the views expressed in general are that there should be no hindrances as regards the trade in nursery stock as between one province and another in the Empire. But the foreigner should be taxed. Then there will be discussions concerning circuit, communal, provincial and school nurseries, and the injury to the trade which results from their competition. These are the more important matters for discussion at next year's meeting.

THE QUARTERLY JOURNAL OF FORESTRY.—In the last issue of this excellent publication, edited by Mr. W. R. FISHER, and published in July, there is a very informative and illustrated article on the life history of the Beech. Other articles include one recommending the conversion of underwood into high forest, and one on the mismanagement of Quick-Fences in England. Dr. SOMERVILLE has an article on the caterpillars of *Argyresthia lævigatella* attacking Larch trees, with illustrations. A report of a lecture delivered by Dr. A. HENRY to the Ashmolean Natural History Society, at Oxford, gives an interesting account of Dr. HENRY's recent tour in the forests of the Rocky Mountains, Spain, Corsica, and Algeria.

CYTISUS ALBUS (LINK).—This is one of the more promising species of *Cytisus* for forcing, and it is occasionally quoted in lists of hardy shrubs. Not by any means a newly introduced plant, it is rare in gardens, and is generally confounded with *C. præcox*, which is equally good for forcing; and there is the risk of confounding it with *C. albus* [Hacquet], of which one form is known in nurseries as *C. Shipkænsis*. *C. albus* [Link] belongs botanically, as well as *C. præcox* and *C. purgans*, to the sub-genus *Spartocytisus*, and reminds one in outward appearance, in the slender rod-like shoots of dull green colour, of *Spartium scoparium* and *Genista Andreana*. The shrub is of an evergreen or half-evergreen character, and the flowers are of the size and form of those of *G. Andreana*, and other small-flowered species, the colour white. It comes into bloom at the same time as *C. purpureus*—

i.e., in early June, and reaches a height of 4½ feet. As a standard worked on the *Laburnum* stock it has an excellent effect. The plant is a native of South-west Europe and Northern Africa, as is evident from the name, *Genet blanc du Portugal*, given to it in French lists. *Thalacker's Handelsgartner*.

VIOLA TRIALS.—Under the auspices of the Scottish Pansy and Viola Association, and with the co-operation of Mr. WHITTON, superintendent of the Glasgow parks, an extensive trial of Violas is being made in the Queen's Park, Glasgow. They are grown by Mr. McIVER, who has charge of this beautiful park. The object aimed at is to find out which kinds are best suited for bedding purposes. Six plants of each variety to be grown were sent from cultivators in different parts of the country, there being about 40 to 50 lots of each of the leading colours. On July 24 they were inspected by four judges, under the guidance of Mr. MILNE, president, and Mr. SMELLIE, secretary of the Scottish Pansy and Viola Association. The following varieties were placed in the order of merit as follows, the first-named variety receiving the greatest number of marks:—*White varieties*.—Christiana, Alexandra, and Bethea, equal (24 marks each), Marchioness, Countess of Hopetoun, and E. C. Barlow (20 marks each), Blanche (16), and Niphetos (4 marks). *Yellow varieties*.—Red Braes (32), King Cup (20), Grievii, Canary, and Meteor (16 each). *Lavender selfs*.—Kitty Bell and Lavender Queen (24 each), Florizel (20). *Blue varieties*.—Wm. Haig (28), Blue Bedder and Mary McLean (20 each), Max Kobb and Royal Scott (16 each). *Striped and Fancies*.—Maggie Currie (28), Jenny McGregor, Dr. McFarlane, and T. W. R. Johnstone (24 each), J. H. Watson (20). *Edge varieties*.—James Pilling (32), Willie Farmer and Mrs. Chichester (24 each). In the evening the society met in the Religious Institution Rooms, Buchanan Street, Glasgow, when a goodly number of promising seedling blooms were presented for inspection. The following fancy Pansies were awarded First-Class Certificates, viz.:—Wm. Cuthbertson, Mrs. S. Mitchell, Arthur Brown, and Jenny Morris. Certificates of Merit were also awarded to several other varieties of Pansy and Viola.

THE GARDEN CHARITIES.—We are informed that the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund have recently received substantial sums of money from Mr. FRANK CRISP, LL.B., J.P., being part proceeds of fees received for admission to view his interesting gardens at Friar Park, Henley-on-Thames. It is very pleasant to record such instances as this, and we commend Mr. CRISP's example as one worthy of more general imitation.

HORTICULTURE AT READING.—That horticultural activity is one of the distinguishing characteristics of Reading is well known to most of our readers. The fact is illustrated very plainly in the issue of the *Reading Standard* for July 27, which contains reports of the visit of the Reading Gardeners' Association to Welbeck Abbey, the residence of the Duke of PORTLAND, on July 17, and of the visit of the National Sweet Pea Society to Reading on July 26. In connection with the Reading Society's visit to Welbeck there are several photographs of the party, and separate portraits of Mr. W. TURNHAM, chairman of the association, Mr. F. W. MACDONALD, treasurer, and Mr. H. G. COX, secretary. The visit of the Sweet Pea Society is marked by the reproduction of two photographs of the visitors, one of which shows the members in the act of inspecting the trials. There is also a portrait of Mr. CHARLES FOSTER, Assistant Director of the Horticultural Department, Reading College, under whose superintendence the trials have been cultivated.

A VETERAN GARDENER.—On July 23 last Mr. ROBERT ANDERSON completed his 80th year of age, and also 44 years' service as head gardener at Sewerby House, near Bridlington, East Yorkshire. Born in Banffshire he has served in many famous gardens, including those at Haddo House, Aberdeenshire, and Trentham, in Staffordshire. On his 36th birthday he went to Sewerby House as head gardener, where he still remains active and well. Mr. ANDERSON raised the beautiful *Tacsonia* × *Andersonii* (see *Gardeners' Chronicle*, August 7, 1875, p. 167). Of his five sons three have followed the gardening profession, two having commenced business on their own account, and one is in the United States of America.

KEW GARDENERS AT CRICKET.—The annual cricket match between past and present Kew gardeners was played at Kew on July 27, and resulted in a win for the present men by 63 runs.

"NOS ARBRES."—A book has been issued in Geneva and Paris by M. H. CORREVON, President of the Société pour la Protection des Plantes. He pleads for the preservation of fine native and exotic trees. The work is well written and in part admirably illustrated. The first portion is concerned with historical trees, the forests, the story of disforestation and afforestation in Switzerland and adjacent countries; the second part treats of the trees of the woods, parks and avenues of Switzerland.

Publications Received.—Board of Agriculture and Fisheries. Report on the Prospects of Crops.—*The Book on Water-Gardening*, by Peter Bisset, published by the A. T. De La Mare Printing and Publishing Company, Ltd., New York.—*Tourist Guide to the Continent*, published by the Great Eastern Railway Company, price 6d.—*Staffordshire County Council Education Committee*. Directory for Higher Education 1907-1908, containing the regulations of the committee and details of schemes in operation throughout the administrative county.—*Journal of the Royal Horticultural Society*, Vol. xxxii., June, 1907.

MARKET GARDENING.

CROPS IN THE WORTHING DISTRICT.

THE season for most crops is quite a fortnight later than the average. The prospects for Chrysanthemums are good. A stock of the variety *Souvenir du Petit Ami* that came under my inspection was remarkably fine. One of the large growers, Mr. F. E. Sparkes, has 80,000 of these plants under cultivation, and another market nurseryman, Mr. Dorey, Sea View Nurseries, has 20,000 plants. In both instances the owners were satisfied with the appearance of their plants.

Tomatos promise a late crop, especially those grown in unheated houses. The system of culture generally adopted is to level the beds in which Cucumbers have been grown and to plant the Tomatos in soil of a very little depth upon a hard bottom. One large nurseryman, Mr. W. Magness, plants the variety *Tuckwood Favourite* for a main crop. Bright sunshine is especially welcome to Tomato-growers, for the fruits sell cheaply, and the returns do not allow of expenses for fuel.

Grapes are the staple crop of the district. Mr. T. Blissett has a very regular crop of *Gros Maroc*, each vine averaging 20 bunches. *Black Alicante* is a very level crop. In four establishments I visited some of the vines were trained as double, and others as single rods; in each instance they were doing well. Mr. W. Magness, of West Worthing, has a span-roofed vinery 450 feet long, from which he obtained 8,000 lb. of Grapes last season, and the present crop promises to be equally as heavy.

Early, mid-season, and late crops of *Gros Colmar* were, without exceptions, good. The variety *Muscat of Alexandria* is largely grown in

the Worthing district, and both the early and the mid-season crops (very few late ones are grown) were promising.

In the houses in which Grapes will shortly be cut, the foliage was being tied back, in order

Peaches are being supplanted by vines, for in more than one house this season vines have been planted in their stead. I noticed a very heavy crop of Peaches in one nursery. The fruits are sent to the Midlands, where they are realised.

FIG. 35.—ROSE HUGO ROLLER, A NEW TFA VARIETY WITH CREAM-COLOURED PETALS, THE OUTER ONES WITH A DEEP SUFFUSION OF CRIMSON. (See page 76 ante.)

that more light might be admitted to the berries. Copious waterings and heavy feeding are practised by all the growers both in the case of inside borders and those outside.

ing from 1s. to 2s. per dozen—a poor return, but one which, the grower informed me, pays. Peach houses are used for Chrysanthemum culture later in the season. Stephen Castle.

THE ROSARY.

CULTURAL NOTES FOR AUGUST.

THE first blooms of the early-flowering varieties are nearly over, and now is a suitable time to remove all weak and badly-ripened shoots. Seed capsules and untidy flowers of Tea and Hybrid Tea varieties should be removed, and the flowering stems be pruned back two buds from the base. Any rampant-growing shoots should also be shortened, for, if this is done early in the present month, a free and continuous display of bloom may be expected. All plants in an active condition of growth should be given copious applications of liquid manure, alternated occasionally with a sprinkling, on the loosened surface of the ground, of

now be made in budding the Manettii and De la Grifferie stocks. The latter are specially suited as stocks for strong-growing varieties of the Rambler type, and climbing Noisettes and Tea varieties, such as W. A. Richardson, Lamarque, Ophirie, Aimee Vibert, Cheshunt Hybrid, and Kaiserin Frederic. The Manetti stock is most suitable for the Hybrid Perpetual type of Roses. Hybrid Tea varieties are really more perpetual in flowering than the former, and they deserve to be more extensively cultivated than at present. Insert the buds as low down on the stem as is possible, and even remove some of the soil just above the roots to allow of this being done. If any buds that were inserted early this season have failed to grow, insert others to take their places as near to the main stem as is possible.

increasing new and desirable varieties among the Hybrid Perpetuals or other strong-growing kinds that lend themselves to this mode of propagation. Choose the best-ripened shoots from among those springing from near the soil, and at about 1 foot or more distant from the main stem. Cut a slit or notch, about one inch long, half-way through on the under side of the shoot. Remove about six inches of the soil so as to cover the shoots, and mix some sandy grit and burnt earth with the excavated mould. Place the shoot carefully, and without breaking it, in the hole, and cover the cut portion with soil, after first making the shoot firm with a hooked peg or iron pin inserted just above the notch. Level the soil and make it quite firm about the shoot. If dry weather prevails, afford copious waterings and well mulch the surface of the ground. Pot-plants and grafted Roses, and those on their own roots that were stopped for the last time as directed in July, will now be ripening their growths previous to their season of flowering, which extends from September onwards. J. D. G.

[Photograph by C. Jones.]

FIG. 36.—CURRANT WHITE DUTCH.

THE WHITE CURRANT.

THE White Currant ranks amongst the best of hardy bush fruits for dessert purposes, and although its flavour and general eating qualities are far superior to those of the Red Currant, it is merely an albino form of the same species—*Ribes rubrum*. It is quite distinct, however, from the Black Currant, for this is derived from *Ribes nigrum*, and the Currants of the grocer are simply a small species of Grape. The White Currant is seldom eaten in a cooked condition, but for the dessert table they form a choice dish, and sometimes the choicer bunches of the Red Currant are mingled on the same dish as the White, the two forming a pleasing effect. The White Currant is the least hardy of the three types, but given a favourable soil and situation it is not difficult of culture if treated according to the general principles of training, pruning, &c., afforded the Red. The best mode of propagation is by means of cuttings, and these should be inserted in the autumn when the young shoots are mature, but they will form roots if inserted any time before March of the following year, although a season is saved if they are rooted by early autumn propagation. The standard variety and the one most often met with in gardens is White Dutch (see fig. 36), and this has numerous synonyms, being known as Blanche d'Hollande, New White Dutch, Jeeve's White, Morgan's White, White Crystal, White Leghorn, &c. Of late years a new variety of much merit, known as Transparent, or Versailles, has been extensively planted. Other varieties are Wilmot's Large White, Blanc de Boulogne, and Yellow German.

COLONIAL NOTE.

WATSONIA ARDERNEI.

YOUR correspondent, F. W. G., complains (p. 373) of the non-success which followed his treatment of the bulbs of *W. Ardernei*. Here, living in the midst of these beautiful bulbs, we find that the best flowers are always obtained from bulbs that are not shifted during their dormant stage. It is also a mistake to allow the bulbs to become thoroughly dried; it is far better to keep the soil somewhat moist, and to grow them undisturbed in the ground instead of in pots. In their natural habitat they flourish in very wet situations, starting into life in winter and blossoming in spring. It will also be found that when the bulbs are left undisturbed in the ground, they will rapidly increase in numbers, and produce stronger growths and blossoms than otherwise. This *Watsonia* is one of the hardiest species, and it resents being coddled. E. P., Cape Town.

Clay's Fertiliser. In dry seasons there is often a difficulty in conveying moisture to the roots in a sufficient quantity by surface waterings. To ensure water reaching the roots, make holes in the soil with pointed iron rods deep enough to allow the water to penetrate to the roots. This system will prevent the roots growing too near to the surface of the soil, and thus becoming, unless well covered with a mulching, scorched by the sun. As soon as the buds on the early-worked stocks commence to swell, the material used for tying should be loosened, and the shoots on the briar pruned back a few inches. Buds being now plentiful and in the best condition for inserting, the opportunity should be taken of performing any budding that is needed. A start may

The present is a suitable time for inserting cuttings of Roses. Select for the purpose short-jointed sideshoots, taken off with a heel, and insert them singly in small, well-drained pots filled with sandy loam, and covered on the surface with a little pure sand. Water the cuttings after they have been inserted, and keep them shaded whenever necessary. Stand the pots in a cold frame and shut the frame close. Some of the cuttings will form roots during the autumn, but if the frame be placed on a hot-bed of moderate heat and the pots be plunged, all the cuttings should form roots and become established before the winter arrives.

Ply the hoe to free the borders and the beds from weeds. July is the best month for layering Roses, a simple and sure method of

TREES AND SHRUBS.

OLEARIA NITIDA.

THIS species was introduced from New Zealand in 1886. Though an extremely handsome flowering shrub, it is, curiously enough, rarely seen in gardens, although such species as *O. Haastii*, *O. stellulata*, often misnamed *O. Gunnii*, and *O. macrodonta*, are fairly common. In New Zealand it is said to reach the size of a small tree, and to grow at an elevation of 4,000 feet. It is probably as hardy as *O. Haastii*, which is found at the same elevation, and harder than *O. stellulata*, but, the number of plants grown in the open in this country being limited, this is, at present, rather a matter of conjecture. The specimen illustrated at fig. 37 is 5 feet 6 inches in height, and it endured 10° of frost on four nights in the last winter, but not a leaf or shoot was injured. As will be seen, it is an attractive object when in full bloom. The small, white, Hawthorn-like blossoms are about half an inch across, and are borne so freely on loose, branching racemes, that, as is shown in the illustration, they entirely hide the foliage. The leaves are leathery in texture, 3 inches in length and 2 inches in breadth, deep green on the upper surface, and silvery white beneath. The flowers were borne in such profusion on the plant illustrated that when the withered bloom-clusters were cut off, they completely filled two bushel baskets. *S. W. Fitzherbert, South Devon.*

CHOICE SHRUBS AT LEONARDSLEE GARDENS.

ONE of the most beautiful shrubs in flower at the present time is *Styrax japonica*. The flowers hang like Snowdrops from the underside of the branches, which are covered with thousands of the pretty white blossoms. This specimen is about 20 feet high, and there is another, not quite so large, planted in a cold, heavy soil, where it is flowering grandly. These trees are given no protection whatever, and they need no pruning. *Stuartia pseudo-camellia* is just now one mass of flowers, which resemble those of a single *Camellia*. They are pure white, with yellow anthers, and measure about 3 inches in diameter. This plant also grows well in a heavy soil.

Cytisus nigricans is a lovely variety of Broom, with a somewhat bushy habit. It grows and flowers with freedom. The specific name is derived from the black colour of the flowers when they are dried.

Cistus ladaniferus is now a fine feature in these gardens. It is one of the best of all the Rock Roses, is perfectly hardy, and very floriferous.

Chionanthus retusus is covered with its fringe-like flowers in white and drooping racemes. The plant is hardy and does well in a cold soil.

Caesalpinia japonica is an interesting plant, with canary-yellow-coloured flowers produced in racemes, somewhat after the manner of a small *Acacia*. The plant requires a liberal treatment in order that it may succeed. The wood has long prickles, which are turned the reverse way of the growing plant. *W. A. Cook, Leonardslee Gardens, Horsham, Sussex.*

PLANT NOTE.

POLEMONIUM CONFERTUM MELITUM.

THIS exceedingly pretty plant, a native of the Rocky Mountains, is very useful for culture as a pot plant in a cool greenhouse. The long, narrow, rich-green, pinnate leaves give a grand effect to the dainty, fragrant, creamy-white flowers, which are borne in terminal axillary racemes on stems 10 inches in height. It should be planted out-of-doors in deep, sandy soil, and be watered freely during hot, dry weather. A suitable soil for its culture in pots is one composed of equal parts rich loam and sand. The plant needs to be freely watered in dry weather. *W. Glover, Langport.*

NURSERY NOTES.

MESSRS. H. CANNELL & SONS.

ON the occasion of a recent visit, the day being stormy and unfavourable for viewing the outdoor plantations at Eynsford and the adjacent orchards and fruit gardens, I had to be content with an inspection of the glasshouses at the Swanley branch. The first one entered was filled mainly with *Gloxinias*, then past their best and in process of maturing and seed setting. The plants were large, with very robust leaves quite concealing the pots. Some possessed blooms 3 or 4 inches in diameter. One new

of the beautiful colours and large size of the blooms, more especially the varieties *cinnabarina*, *aurantiaca* (an orange-scarlet), *alba*, *rosea*, *violacea*, *delicata*, *rosea*, and the peculiarly coloured *salmonea*. These plants bloom early, and are almost continuously in flower. The height of the plants is 1½ to 1¾ feet, and the habit of growth bushy. Of *Streptocarpus*, many were noted carrying immense numbers of blooms of various colours and markings, rivalling the finer *Gloxinias*.

In the *Canna* house my attention was arrested by the following: *C. Venus*, rose-pink edged with yellow; *C. Niagara*, only 1½ feet high, of a brilliant shade of scarlet edged with golden yellow.

[Photograph by S. Wynham Fitzherbert.]

FIG. 37.—OLEARIA NITIDA, A HARDY SHRUB.

variety has a white throat and overlapping segments—the flower of the future, as Mr. Cannell hopes. Some have spotted throats, and others have pretty spots on the margins of the segments, whilst striped throats were observed in some; and in others crimson lobes and pure white throat. One named “Her Majesty” is white, of immense size and fine shape. Another, “The Giant,” is quite 6 inches in diameter, and a variety “Miss Willmott” is a fine one of the colour of the *Verbena* so called. A nice collection of *Impatiens Sultani* and *I. Holstii* varieties—German raised—called for attention by reason

low, with scarlet spots—the flowers large; *C. Mrs. C. A. Strohelein*, a fine crimson variety; *Evolution*, a fine, old variety of buff and yellow colours and a big spike; *Duke Ernest*, a scarlet which, though of large size, stands the weather well; *Frau E. Kracht*, of a salmon-pink tint having a yellowish tinge; *Julius Metz*, an orange-scarlet-coloured bloom—a very fine thing. Others possessing high merit were *Papa Crozy*, *W. Watson*, *Gladiator*, *Elfe*, *Jean Monval*, *W. Tell*, and *Hermann Aldinger*, a rich crimson flower.

In the *Carnation* house there were noted

Souvenir de la Malmaison Princess of Wales (Newton Don variety), a fine flower of a light pink colour; and Duchess of Marlborough, also pink in colour with stripes of darker tint, a fancy, having a perfect flower, very good for cutting purposes. Numerous American varieties were observed, of which Prosperity, having carmine stripes, on a white ground, deserves notice.

The Begonias in another house were a beautiful lot that could scarcely be excelled. Mr. Cannell has been raising Begonias for the past 20 years. One of his new varieties, of which there can be only one opinion, has imbricated petals like those of *Camellia imbricata alba*; and, like others of the collection, it never produces seeds, but must be raised from cuttings. Comet is a double flower of a scarlet

leaves partake of the Oakleaf form, and the colour of the flowers is pleasing. The winter-flowering Zonal Pelargoniums were making fine growth, and will keep in bloom for an entire year—a most valuable class. Among varieties of double and single flowered Pelargoniums raised at this nursery, mention should be made of Arabic, scarlet with an eye of white, and a fine truss; Saxonia, even larger, and of the same colour; Lucania, likewise scarlet in colour, with very large blooms and truss; Carmania, of a rosy-scarlet tint, producing a very big truss, the individual pips of which are big, and the foliage distinctly zoned; and Chauteraine is a pale pink flower having an edge of a darker shade. Of double-flowered varieties in bloom there were Val Fleuri (a deep

from insects is fully appreciated by the London salesmen to whom the fruit is consigned, and the prices obtained are therefore much in excess of the ordinary ones paid.

A wash, non-poisonous and colourless, manufactured by Messrs. Cannell and Sons, is applied by means of a "Vermorel" sprayer at all stages of growth, excepting when the fruits are ripening, to all kinds of fruit bushes and trees. *M.*

NOTICES OF BOOKS.

ROCK AND WATER GARDENS.*

THIS book is written, as the author informs us in the preface, for those who love the flowers of mountain and stream, of Alpine pasture, and reed-fringed pool; for those who gladly welcome into their gardens a class of plants whose beauty and charm is not surpassed by any other. It is also written with the hope that it may arouse interest in those who have no knowledge of rock and water plants, and yet have facilities for growing them.

The book embraces some 90 pages, and in its twelve chapters deals with: I., "Rock and Alpine Gardens"; II., "Rock Garden Construction"; III., "The Garden of Alpines"; IV., "The Rock Garden in Spring"; V., "Rock Garden Plants"; VI., "Rock Shrubs"; VII., "Wild Water Margins"; VIII., "Small Water Gardens"; IX., "Bog and Marsh Gardens"; X., "Lily Tanks"; XI., "Water Lilies"; XII., "Aquatics and Bog Plants."

There are numerous illustrations which have a direct bearing upon the varying phases of the work with which the book deals, and a more or less complete index will afford some assistance for reference. The book is written in an interesting and intelligent manner, and the pleasure excited by a glance at the early pages of the book increases with further reading.

Chapter I. deals with rock and Alpine gardens, and defines the difference between the rock garden and the rockery. The latter, with its collection of clinkers, pottery, and the like, "no good gardener will tolerate, contravening, as it does, all ideas of good taste and artistic perception."

The rock garden, we are informed, "is a definite piecing together of natural rock and stone, and is so formed that it shall offer ideal conditions for the growing of Alpines and such plants as occur naturally on mountain sides and at high elevation." We can scarcely agree with the author when he states, on page 3, "It is not so much the altitude that suits these miniature flowers, but rather the absence of plants of robust habit and coarse growth," for there are many native plants of the higher altitudes that miss the great snow-mantle that for many months each year protects them, keeping them dry and free from the changes from wet to frost so frequent in a lowland garden.

The need for a greater depth of a proper rooting medium than is usually afforded these plants, and "the rich soil they certainly do not need," are items of importance commented upon. We note with pleasure, on page 6, a condemnation of those perpendicularly set stones, or others that form "a roof to the plants beneath," for there is nothing more opposed to good effect, or to the growth of Alpine plants, than these nearly perpendicularly-placed stones, all the more incongruous when of clearly stratified rock. These "impossible pinnacles" are worse than useless.

Valuable, and full of sound instruction, is the chapter on "Rock Garden Construction." The chapter dealing with "The Garden of Alpines" is especially helpful in that it deals minutely in not a few instances with the likes and the dislikes of many Alpine plants; and the information afforded on these points merits

* "The Book of Rock and Water Gardens," by Charles Tonger. Published by John Lane, London. Price 2s. 6d.

FIG. 38.—A FLOWERING SPRAY OF *OLEARIA NITIDA*: FLOWERS WHITE.

(See page 94.)

colour; Blush Queen is an extremely large flower; Lord Stradbroke is a grand scarlet bloom, and W. H. Grenfell; Lady E. Mallet, rose-coloured with a white centre; Sunflower, of a pale yellow tint, double and large; and Enchantress, of pink and buff colours, are all good varieties. A new strain of tuberous Begonia has channelled petals, very pleasing, and scalloped margins.

Pelargoniums, for which the firm has achieved great reputation, were in fine bloom; and of these I may mention Omphale, a flower of a salmon-pink colour, with large pips and trusses; Clorinda, one of Dr. Bonavia's raising, blooms in mid-winter, and at other seasons; the

cerise), MM. Fournier, Sarloveze (of a charming pink tint), Mdle. Meindre (a distinct salmon-pink), Paul Rebaux (pinkish crimson), Queen of Spain (cerise), Paul Crampell (one of the best for potwork as for bedding), and very bright. Of this last, it is said Her Majesty the Queen will have no other variety planted in the gardens at Buckingham Palace.

On visiting one of the mixed fruit plantations, one could but be impressed by the extraordinary heavy fruiting of the Raspberry canes, every blossom of which appeared to have set, the crop being the heaviest possible, and the fruits entirely free from insects of every kind injurious to this fruit. The value of this freedom

careful perusal. Nor will the reader be overdone with these hints at any point of the story; rather does he come upon them at intervals, the results, as it would appear, of diary notes made on the mountain side, and amplified at leisure. But if in this sense disconnected somewhat, the freshness and the interest remain throughout.

The lists of plants supplied at the end of Chapter V. is very meagre, and no mention is made of some of the choicest plants, such, for instance, as *Adonis amurensis*, *Androsaces lanuginosa*, *pyrenaica* and *sarmentosa*, and Alpine *Columbines*. In the list of *Dianthus*es, *D. alpinus* is absent, but *D. cæsius* and *D. deltoideus* find a place. *Anthemis aizoon*, cited on page 38, and which we have found of doubtful hardness in some parts, and wholly unreliable in others, is now referred to as *Achillea ageratifolia*.

"Lily Tanks" and "Water Lilies" are treated of in the concluding chapters, and, of the latter plants, a full descriptive list is given.

The illustrations facing pages 6 and 8 afford proof of what may be done in quite a small way in this style of gardening. The "Wild Garden" scene, page 20, is also of educational value.

CAMPANULA PUNCTATA.

THIS very distinct bell-flower (see fig. 39) produces long, pendent, white flowers. It requires good culture and an ample supply of moisture at the roots to be seen at its best. When growing in rich, deep soil, with a plentiful water supply it forms a plant of very different appearance to specimens in poor, dry ground, where it becomes so changed in character for the worse as to be hardly worth growing. It is an old garden species, but one rarely met with nowadays. It attains to a height of 2 feet, and its drooping, white flowers are rather over 2 inches in length and about an inch across at the mouth. Although pure white on the outside, these flowers are spotted in their interiors with innumerable small purple-red dots. The blossoms are hairy. In some cases the flowers, instead of being white, are of a soft rose-colour. This plant has a very wide range of habitat, being found in Siberia, China, Japan and Corea. In places not suited to its culture it often dies in the winter, and has, in consequence, sometimes been classed as an annual, but it is a true perennial. *S. W. Fitzherbert*. [An excellent illustration of the flowers of this species was given as a supplement to *Gardeners' Chronicle*, August 26, 1905.—ED.]

LAW NOTE.

PLANTS DAMAGED BY CREOSOTE FUMES.

A NURSERYMAN carrying on business in Cheltenham Road, Bristol, recently made a claim against the Bristol Tramways and Carriage Co. for damages for injury to plants alleged to have been caused by fumes from newly laid creosoted wood-paving blocks. The company said that nothing they had done had caused the injury to the plaintiff of which he complained, and in the second place they said if they had done it they were protected by Acts of Parliament which empower them to do the injuries complained of. The jury, after having been absent for 1½ hours, returned the following answers to the questions:—

(1) Do you find that the injury to the plaintiff's plants was caused by the wood paving or not?—We find it was.

(2) Do you find that it was reasonably necessary for the defendants to repave the road in the way they did, and at the time they did?—Yes; but in the light of the evidence given at the hearing, No.

(3) Do you find it was absolutely necessary for the defendants to repave the road as they did, and when they did, or not?—No.

Mr. Inskip, upon these answers, asked for judgment for the plaintiff.

Mr. Salter asked for judgment for the defendants as the answer to the second question was quite conclusive. He contended that the defendants were entirely protected by statute.

Eventually the judge entered judgment for the plaintiff, but stay of execution was granted, with a view of entering an appeal.

KEW NOTES.

A GLIMPSE OF THE GARDENS IN JULY.

JULY is rather late for the Kew rock garden, as the *Ramondias* and most species of *Meconopsis* are then out of flower, but there are many interesting plants still to be seen. Two tall specimens of the blue Himalayan Poppy, *Meconopsis Wallichii*, were still in bloom, and in a damp situation two of the new *Rodgersias* were very handsome. *R. pinnata*, with large, deeply-corrugated leaves, divided into seven sections and great, branching heads of small, white, red-centred flowers, carried well above the foliage, was very fine; and *R. tabularis*, with finely formed leaves and bearing a feathery, white flower-head, was attractive. A group of *Orchis foliosa*, from Madeira, was in good bloom. *Linaria dalmatica*, with tall, branching spikes of yellow flowers, 4 feet in height, was very effective; and the mauve-flowered, creeping Pea, *Lathyrus maritimus*, was pretty. *Linum flavum* was a mass of bright yellow; *Polygonum affine*, set with long, pink

persicifolia and varieties, *C. glomerata dahurica* and *C. g. alba*; *C. garganica*, a sheet of soft blue; *C. carpatica* and its beautiful variety *C. c. pelviformis*, *C. latifolia macrantha*, *C. lactiflora*, *C. Burghaltii*, with drooping, lavender-pink coloured flowers; *C. G. F. Wilson*, *C. mirabilis*, with pale-purple, bell-shaped blossoms on a branching spike 9 inches in height; *C. linifolia*, purple, 1 foot; *C. phytidocalyx*, 2 feet in height, with purple, bell-shaped flowers; *C. spicata*, with long, lavender-purple flowers closely set on a spike 2 feet in height; and *C. tomentosa*, bearing small, star-shaped, mauve-blue coloured flowers on a low spike. *Dianthus callizonus*, *D. cæsius*, *D. deltoideus*, *D. Sternbergi*, *D. superbus*, *D. viscidus*, and *D. Waldsteinii* were in bloom; and of *Geraniums*, *G. argenteum*, *G. armenum*, *G. cinereum*, *G. nodosum*, *G. sanguineum*, with its varieties *G. s. album* and *G. s. lancastriense* and *G. subcaulescens*, were in flower. Among the *Gentians* were *G. decumbens*, the tall *G. lutea*, *G. Walujewi*, clear blue, and *G. Kesselringii*, white purple-spotted, both from Turkestan; *G. phlogifolia*, deep blue, from Transylvania, and *G.*

FIG. 39.—CAMPANULA PUNCTATA: FLOWERS WHITE OR PALE ROSE-COLOUR WITH PURPLE-RED SPOTS.

flower-spikes, was clambering over an old tree stump; and *P. sphaerostachyum*, from the Himalayas, was bright with crimson blossoms. A mass of *Acantholimon glumaceum*, 3 feet across, was covered with pink flowers, but *A. venustum* is a prettier plant. The blue-flowered *Pentstemon heterophylla*, a foot in height, was attractive; as was *Potentilla nepalensis*, with buff, crimson-eyed blossoms, and *Sphaeralcea acerifolia*, 4 feet in height, with pale, pink flowers 1½ inches across, having a black blotch at the base of the petal, was good. Another charming plant was *Symphandra ossetica*, from the Caucasus, with heads of lavender-blue, drooping flowers an inch in length; while *Zigadenus elegans* was very graceful with its branching flower spikes, 3 feet in height, of small, greenish blossoms. Many *Campanulas* were in flower, these including *C. pusilla* in large groups, *C. rotundifolia soldanelliflora*, a very pretty form of the common Harebell, of which a mass was hanging over a rocky ledge; *C.*

straminea, from China, with white flowers spotted with purple on the exterior.

In the garden of herbaceous plants, a group of the annual *Meconopsis heterophylla*, with dark-eyed, orange-coloured flowers, was very handsome.

At Kew the good effect produced by planting single varieties of *Roses* in masses may be appreciated. A large round bed was filled with *Caroline Testout*. Other good beds were those of *Frau Karl Druschki*, *Mme. A. Chatenay*, *Captain Christy*, and *Mrs. John Laing*. In the *Rose dell* a great breadth of *Fellenberg* in full bloom was a picture, and rambling masses of *Psyche* and *Clothilde Soupert* were charming. A large bed of *Spiraea discolor*, better known as *S. ariæfolia*, in the zenith of its blossoming, was a lesson in effective grouping, and a *Conifer* shrouded with *Polygonum baldschuanicum* in full flower was a lovely sight, and showed how well suited this hardy climber is for beautifying trees that are past their best. *S. W. Fitzherbert*.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

FLORA OF PALESTINE.—In the review (on p. 62), of the *Flowers and Trees of Palestine*, it is stated that Lign-Aloes had nothing to do with the modern plant, but is a mistranslation of the Hebrew word for tents. I have discussed the word in the *Encyclopædia Biblica*, and in Numbers 24, 6, the word is not a mistranslation or rather misreading for "tents," but for terebinths. But the Aloes mentioned in three other passages was the same thing as Lign-Aloes and was not the medicinal drug. The philological evidence is convincing that it was identical with the Eagle-wood of the east which was certainly known to the Greeks. The evidence for identifying Hyssop with *Satureia Thymbra* is plausible. I incline, however, myself to think it was the Caper, which is a ubiquitous wall plant in the eastern Mediterranean countries. *W. T. Threlton-Dyer*.

SUMMER PRUNING OF FRUIT TREES.—Having read the correspondence published on this subject and studied the tables (pp. 400-403), it seems to me that many correspondents have confused the practices of summer pinching and summer pruning. The former I look upon as perhaps the most useful operation in the culture of garden fruit crops, and the latter the most fruitful source of failure. I believe that more trees are spoilt by summer pruning than from all other causes combined, save natural ones, such as inclement soil or adverse climate, over which the gardener has only very partial control. The dates given by the compilers of the tables show to a great extent what their practice is, for when one reads June as the date of summer pruning one knows that pinching is implied, and when August is named then pruning is the practice. To consider the difference between the two, we will take, for example, any of the trees which bear their fruit on spurs, such as the Apple, Pear, Plum, and most Cherries, and for a typical tree a single cordon. If the side shoots of such a tree are pinched when they have made six leaves, they are prevented from becoming gross, and the lower buds become plump and develop into fruit spurs. These pinched shoots will grow again from the two end buds, and the secondary shoots should be pinched again, say, in July. In winter pruning, the side shoots of young and vigorous trees should not be cut below four buds until a fruit bud is formed, when they may be cut back to the fruit bud. If the shoots are closely pruned to two buds, as many are, the result is that both the buds left make growth the following season, and the tree becomes crowded with leaves and produces no fruit until it is so exhausted by the treatment that it refuses to grow more or until that drastic operation known as root-pruning is resorted to. When the date of summer pruning is deferred until August the effect may be beneficial, but if rains are frequent most of the buds left will break into growth and thus prevent the formation of blossom buds, but be this as it may, the side shoots will have become very strong and will be less inclined to produce fruit spurs than the thinner growths, resulting from the pinching system. If strong side shoots are pruned in July the buds must break into growth, and the result is a thicket of growth. The preceding remarks apply, of course, to young and vigorous trees growing in good soil; older trees, which are in full bearing or which are growing in poor soil, will bear closer pruning because they have a weaker flow of sap and more outlets for it, but even with these I think pinching is in every way preferable to pruning later. With the question of pressure of work at the time when the trees should be pinched I am not concerned, but I know that in many cases this is a serious consideration, and I would advise the breaking of the shoots half across at some six or eight buds from the main shoot. Leave the ends of the broken shoots hanging by a portion of wood and bark, and the end portion will absorb some of the sap, whilst the check will cause the basal buds to plump up and develop into fruit buds. I have taken a single cordon tree as an example, for the shoots of a horizontally trained tree are really many cordons, and a pyramid trained tree should consist of many cordons radiating from a central stem. Few

market growers will entail the expense of this kind of restrictive pruning, and they prefer their trees to grow practically naturally after the first few seasons, though one may see hundreds of acres of fruit plantations in Worcestershire where every tree is grown as an open bush and in which each branch is pruned like a single cordon, and the growers make money by the practice. I need scarcely assert what every practical gardener knows, that pinching is far better for stone fruits than pruning, for pinching is never followed by gumming whilst pruning frequently is. Nurserymen know this so well that they pinch the leader out of yearling Peach, Apricot, Cherry trees, &c., required for training, and induce the side shoots to form the first season instead of growing them as maidens and then cutting them back the following winter, the result being that gumming is reduced to a minimum. *A. H. Pearson, Loddham*.

POTATO MUTATION.—A white small-tubered species is assumed to have converted one of its tubers into a huge blue one, and whilst to every simple gardener the finding of such a tuber under such conditions would have been at once attributed to a common-sense cause, it is by other persons regarded as a product of "mutation." In another case *Solanum Maglia* has been said to produce a tuber of the variety *Vicar of Laleham*—again by mutation. How profoundly misleading it all is! How like is it all to the credulity of a correspondent who last autumn sent me two tiny seedling Kidney Potatoes, one white, the other red, and which he declared had originated from the same seed and plant. I assured him he was mistaken, and this year planted both tubers, and these have tops as dissimilar as Potato tops well can be. *A. D.*

MELON TRIALS AT WISLEY.—The extensive trial of Melons which is this year being undertaken by the Royal Horticultural Society at Wisley offers an opportunity of determining the relative value of the many varieties of this fruit, and should result in eliminating from the long list of kinds many of the synonymous and inferior varieties. It will also enable the fruits to be classified according to the colours of their flesh, as well as to note the best Melon in the collection irrespective of class or colour. About 70 varieties are growing under precisely the same conditions. The earliest planted batches of plants are accommodated in light span-roofed houses, and the later batches are grown in low frames or pits. The earliest fruits will be ripe in the course of a fortnight or three weeks. I have seen the plants on two occasions during the past six weeks, the most recent occasion being a little over a week ago, and healthier or better cropped plants it would be difficult to find. The trials, when judged, will be interesting in many ways. One wonders how those varieties which have been certificated by the society from time to time will fare! It is asserted by some growers that a variety of Melon deteriorates in the course of time, hence the necessity for occasionally raising a new kind by cross fertilisation; but other persons hold that once a good Melon, always a good Melon. This trial should throw some useful light on this point. Flavour, however, will be the test of highest merit. At the same time it would be useful to note which varieties are the earliest to ripen their fruits, the heaviest croppers, and which are the handsomest and most attractive fruits. This would all be useful information, for growers for market attach importance to weight and appearance in Melons. It will be impossible to arrange a day when the fruit of all the several varieties will be ripe together, and to judge some growing on the plants and others in a cut state at the Fruit Committee's table in London would scarcely be fair treatment. Apart from the quality of high flavour—which is, of course, the most important of all—there are other considerations, such as robustness of growth, cropping capabilities, &c., which influence the judges in their award to growing plants that cannot be seen when a fruit is shown singly on a plate. It is also well known that ripe Melons in hot weather soon lose their flavour when cut. It is to be hoped that as many varieties of these Melons as is possible to be had will be exhibited at the Royal Horticultural Society's exhibition at Vincent Square, as much public interest is evinced in this delicious and refreshing summer fruit. *Owen Thomas*.

A WARNING!—I wish to warn readers of the *Gardeners' Chronicle* of a man who offers books for sale and who requires cash with the order, as he states he is going to Australia. A friend of mine living in London went to inspect the books so offered at the address given by Mr. — before my sending the cash. He found that the seller was not known there, neither had he ever lived there, but a stranger had called for letters addressed to the name I enquired for. *Harry Curtis, Lancashire*.

AN UNUSUAL NESTING-PLACE.—I recently saw a young cuckoo in a nest in a hanging wire basket containing Ivy-leaved Pelargoniums, and suspended on the verandah in front of a drawing-room not 5 feet from the front window. A pair of water wagtails had built a nest in the basket, and I was informed that the young cuckoo had turned out four eggs of the wagtails' to accommodate itself. The wire basket is about 16 inches in diameter and is suspended by three wire chains. It appears almost impossible for an adult cuckoo to pass between these wires, and this fact lends some evidence to the statement that the cuckoo lays its egg on the ground and afterwards deposits it in the foster mother's nest by its bill. *Jas. Jno. Foster, Stanmore, Middlesex*.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 23.—Present: E. A. Bowles, M.A., F.L.S. (in the chair); Rev. W. Wilks; Prof. Boulger; Dr. Cooke; Messrs. Worsdell, Shea, Spencer Pickering, Güssow, Worsley, Bennett-Poë, Douglas, Sutton, Massee, Holmes, and Chittenden (hon. secretary).

Dying Beech trees.—Mr. Güssow reported that he had examined the wood of the Beech sent to the last meeting and found the mycelium of a *Polyporus* growing in it. He had little doubt that the death of the tree was due to this parasite.

Fuchsia, Vine, and Aucuba.—Messrs. MASSEE and GÜSSOW reported that no fungi could be found in the tissues of either of these sent to the last meeting.

Memorial of Dr. Masters.—Rev. W. WILKS repeated a suggestion he had already brought forward in the Press (see *Gardeners' Chronicle*, June 22, p. 408) concerning the establishment of a permanent memorial of the late Dr. Masters, to take the form of a series of lectures to be delivered annually before the Royal Horticultural Society by some eminent scientific man upon some phase of the relationship between science and horticulture, these lectures to be published broadcast among gardeners. The suggestion met with the cordial approval of the committee, and a sub-committee was appointed to further the matter, consisting of Messrs. E. A. Bowles (chairman), Sir Trevor Lawrence, Arthur W. Sutton, C. E. Shea, J. T. Bennett-Poë, James Douglas, Sir J. T. D. Llewelyn, Dr. Cooke, Rev. George Henslow, M.A., Lt.-Col. Prain, Miss Willmott, Dr. Rendle, Professor J. Bretland Farmer, W. Bateson, H. J. Veitch, G. Nicholson, Professor Church, and Rev. W. Wilks (secretary), with power to add to their number.

Germination of seeds in sterilised soil.—Mr. SPENCER PICKERING raised the question of the germination of bacillus-free seeds in sterilised soil, stating that he had found that the heating of soil to 60° C. and upwards retarded the germination of the seeds to a very marked extent, just as he had found the growth of trees in heated soil was retarded. The seeds (Ryegrass and Mustard) had been sterilised with carbon bisulphide, and had germinated after treatment quite freely in ordinary soil. Different members of the committee mentioned sources of information upon this point.

Galls on Willow.—Prof. BOULGER showed some galls upon Willow similar to those shown last year by Mr. CHITTENDEN, due to the attacks of a mite. The galls were this year very common around Loughton and Buckhurst Hill in Essex, and formed large masses of short shoots with crowded, much-shortened leaves.

Fasciated *Lilium candidum*.—Mr. BOWLES showed on behalf of Mr. HYDE, of Enfield Highway, a fasciated stem of this Lily. The stem

was about 3½ inches broad, and bore a very large number of small flowers.

Lueddemannia Piscatorci.—Mr. BOWLES also exhibited a large spike of this remarkable species, which has already received a botanical certificate.

Chlorosis in fruit trees.—Specimens of Apples on the Paradise stock; Pears on the Quince, Peaches, Nectarines, Plums, Raspberries, and Vines were received from near Glastonbury, all with their leaves showing yellow spots or being wholly yellow. A variety of causes may bring about this condition, such as lack of iron, lime, or potash in the soil, and at times insufficient drainage, combined with lack of sun, &c., may produce similar results.

THE HORTICULTURAL CLUB.

JULY 25.—The annual outing of this club took place on the above date, when about 80 of the members and their friends visited Friar Park, Henley-on-Thames, the residence of Frank Crisp, Esq., by whom the club had been kindly invited. The weather was good, except that in the afternoon rain fell for about one hour, which, however, hardly affected the visitors at all, as the time was fully occupied in inspecting the conservatories containing the collections of rare plants which Mr. Crisp has acquired. Starting from Paddington, three saloon carriages were provided, which conveyed the party to Marlow. From Marlow the visitors proceeded on foot through the pretty and quaint village to the river-side, where Mr. Crisp himself welcomed his guests on board a handsome steam launch provided by him to convey them to Henley. A delightful trip through the lovely river scenery followed, a charming panorama of umbrageous wooded hills, interspersed here and there with beautiful mansions, unfolding itself as the vessel glided noiselessly along, the host giving the history of the various interesting features as they were approached. Reaching Henley, the party disembarked at Mr. Crisp's boat-house, a very unpretending name for a handsome building, which not only accommodated boats below, but permitted of over four score guests being entertained in the hall above it. Mr. Crisp made a humorous speech, intended to forestall a toast in his honour, but, vainly, for Mr. Harry Veitch declined to be thwarted, and, in proposing the host's health, coupled with it the hope that Mr. Crisp would accept the vice-presidency of the club, which he consented to do.

Carriages then conveyed the ladies of the party to Friar Park, the gentlemen following on foot, and here the beautiful house and surroundings met with full appreciation. In many respects the gardens appeared to be unique, for, apart from their water-scapes and super-terrestrial landscape arrangements, the ground is honey-combed with a labyrinth of caverns and grottoes teeming with weird and curious effects. The rock-garden is astonishing in its extent and design; no fewer than 7,000 tons of rock, some of the masses weighing 5 to 7 tons, cover a steep declivity in such a fashion as to represent a mountain stream-bed deviously descending a rocky ravine, while from a comfortable chalet at the lower level the eye travels upwards from one towering mass to another, until, apparently far away beyond the farthest bluff, a peak which one might imagine to be the Matterhorn itself abruptly pierces the sky-line, its sides seamed with apparent snow, and the snow-clad slopes on its lower flanks carrying the eye onwards behind the rocks in the most deceptive fashion conceivable. The rocky foreground is the congenial home of a magnificent collection of Alpine plants, which in the late spring are sheets of floral beauty, and even at the present time are charming in their varied verdure and habit. Beneath the Matterhorn there is an ice cavern, whose artificial nature was only betrayed by the temperature, curiously arranged and hidden electric lights imparting a blueness and transparency here and there to the walls and roof which was most illusive, while in some places stalactites and stalagmites covered roof and floor.

Lower down the valley, so to speak, we plunge down some rocky steps to another cavern, teeming with gnomes and pixies, owls and bats, cats and spiders, and a thousand and one other

quantities of a romantic underland and wonder-land, while in recesses are deftly inserted mirrors, which in some cases reflect the visitors themselves in gnome guise to fit their surroundings, and in others multiply their numbers indefinitely. Another series of caves elsewhere are only traversable by boat, as they form a subterranean channel from one part of the lake to a distant one. Space precludes more than a brief allusion to the conservatories, with a wonderful collection of Cacti, and embracing a newly-designed and very beautiful sunken Fernery, representing a deep ravine with Fern-clad walls, which Mr. Knowles (Mr. Crisp's able gardener) has constructed on the lines of the Fern-house in the Belfast Botanic Gardens.

In the afternoon the party had tea in a tent on the lawn, and subsequently were driven or walked to the station, whither the saloon carriages had been transferred for their accommodation after a most delightfully instructive and amusing day in many respects. T.

[An illustrated article upon these remarkable gardens was published in our issue for October 28, 1899.—ED.]

CARDIFF AND COUNTY HORTICULTURAL.

JULY 24 & 25.—The annual exhibition held in connection with this society took place in the Sophia Gardens on the foregoing dates. Taking into consideration the cold, wet season experienced till within the previous fortnight, the exhibits were of a very creditable character. The backwardness of many subjects was evidenced in the exhibits, but nowhere more than in the collections of hardy cut flowers, for many usually over by this date were staged in good condition, whereas others generally in evidence during this period were missed, presumably on account of their not being forward enough. Not only had the backward season an effect upon the classes devoted to cut flowers, but the recent hailstorms, by the damage they had wrought, were responsible for the absence of several competitors in the Rose and Sweet Pea classes.

GROUPS.

The class for a group of miscellaneous plants arranged for effect in a space measuring 150 square feet was open to all. Lady HILL, Llandaff (gr. Mr. McIntyre), was placed 1st for an artistically-arranged collection. The centre was in the form of an arch, crowned with a specimen of *Cocos Weddelliana*, and the whole design was characterised by lightness of arrangement. Plants of *Humea*, *Campanula pyramidalis*, *Liliums*, fine-leaved *Bamboos*, and *Francoa* were the most noticeable features in this exhibit. 2nd, Col. WALLIS, Newport (gr. Mr. D. Powell); 3rd, Messrs. JAS. CYPHER & Co., Cheitenham.

In a class restricted to amateurs, Mrs. E. LEWIS, Llandaff (gr. Mr. Wall), secured the 1st prize for a group occupying a space of 50 square feet. *Cocos Weddelliana*, *Coleus*, *Schizanthus*, and variegated *Eulalias* were the prominent features of this group. 2nd, Mr. JAMES HOWELL (gr. Mr. Brown).

The Marquis of BUTE (gr. Mr. H. Farmer) exhibited a non-competitive group of choice stove and greenhouse plants, arranged with pleasing effect in a space of over 200 square feet.

CUT FLOWERS.

Roses.—For a collection of 36 *Roses*, in 12 distinct varieties, Messrs. J. JEFFERIES & SON, Cirencester, were awarded the 1st prize. Their best blooms were those of Bessie Brown, Horace Vernet, Mildred Grant, and Her Majesty. 2nd, Messrs. S. TRESEDER & SON, Cardiff. In this exhibit were specially good blooms of the varieties Frau Karl Druschki and Caroline Testout.

Messrs. J. JEFFERIES & SON were equally successful in the collection of 36 Tea or Noisette *Roses* in 12 varieties. Madame J. Graveroux, Catherine Mermet, and Souvenir de Pierre Notting were three outstanding varieties in this collection.

The KING'S ACRE NURSERY Co., Hereford, were awarded the 2nd prize in this class. They had Medea, Marie van Houtte, White Maman Cochet, &c.

Messrs. JEFFERIES & SON again beat all other competitors in the class for a collection of 24 distinct varieties of *Roses*, and also in that for 18 varieties of Tea or Noisette *Roses*. Messrs. JARMAN & Co., Chard, took the first prize for a box of 12 blooms of one variety of a Tea Rose with the variety Mrs. Ed. Mawley. White

Maman Cochet, exhibited by Messrs. S. TRESEDER & SON secured the 2nd prize.

Sweet Peas were well shown in the various classes devoted to these flowers. Messrs. S. STARK & SON, Great Ryburgh, Norfolk, gained the first prize for 19 bunches of distinct varieties of Sweet Peas, amongst which were Henry Eckford, Enchantress, and Queen Alexandra. 2nd, Messrs. JARMAN & Co., Chard. In the audit class, Mr. R. BATHURST, Cudleigh, and Lady MOREL, Penarth, were respectively awarded the 1st (which included a gold medal) and the 2nd prizes. Mrs. JENNER, Wenvoe Castle (gr. Mr. Harris), staged a collection of 12 distinct varieties of Sweet Peas, tastefully arranged with Fern, Gypsophila, and grasses, and for which a 1st prize and a silver medal were awarded.

Miss HEMUS, Upton-on-Severn, exhibited two new varieties of Sweet Peas, which had already secured Awards of Merit, including the R.H. Society's. These were Evelyn Hemus and Paradise Ivory. Messrs. STARK & SON showed a number of novelties amongst Sweet Peas, of which Olive Ruffell is a richly-coloured flower of the Countess Spencer type, with an ivory-coloured base; Geo. Stark, of the colour of Queen Alexandra, but with the Countess Spencer form; and New Waved Mauve, one of the best mauves in the show.

Hardy flowers.—The flowers of hardy plants were much in evidence, and added colour and interest to most of the tents. Although certain classes were restricted to hardy flowers, no stipulation was made that they should not be grown under glass; in consideration of this fact several of the successful exhibitors added greatly to the value of their groups by including *Lilium auratum*, *L. speciosum*, and *L. Harrisii*, none of which are as yet in bloom in the open.

Mr. W. TRESEDER, Cardiff, was placed first with a prettily-arranged collection of hardy flowers, occupying a space of 45 square feet. *Spiraea Davidii*, *Catananche bicolor*, Iceland Poppies, Carnations, and Water Lilies were the outstanding features of this group.

Messrs. H. & W. EVANS, Llanishen, were a close 2nd, with a fine array of well-grown flowers, amongst which *Iris Kæmpferi* in variety, *Spiraea venusta* in variety, *S. palmata*, *Cimicifuga racemosa*, Dwarf *Gladiolus*, and *Lilium testaceum* were noticeable.

FRUIT AND VEGETABLES.

Competition in the classes for Grapes was keener than usual, and in spite of the sunless season the berries on the whole were well coloured. As might be expected, the culinary Apples shown at this early period of the year were very inferior samples, and it is difficult to see the reason for including them in the schedule of an early summer show.

In the class for a collection of dessert fruits, to include six dishes of distinct sorts, Col. HENRY, Ledbury (gr. Mr. Sikes), carried off the 1st prize. The collection consisted of a dish of three bunches of large, deeply-coloured Black Hambro Grapes, a Countess Melon, Early Rivers Nectarines, Frogmore Early Cherries, Hale's Early Peaches, and Brown Turkey Figs. 2nd, G. A. GIBBS, Esq., Flax Bourton (gr. Mr. Wilkinson).

Vegetables were, perhaps, the most meritorious exhibits at this show, and were greatly admired by those interested in this side of gardening. The 1st prize, including the Royal Horticultural Society's Bronze Medal, was won by Lord ALDENHAM, Elstree (gr. Mr. E. Beckett), for a collection of nine distinct kinds of vegetables, arranged in a space measuring 20 square feet. The following were the kinds and varieties included:—White Leviathan Onion, Globe Artichoke, Early Giant Cauliflower, Sutton's Black Beet, Gladiator Potato, New Red International Carrot, Centenary Pea (extra fine), Perfection Tomato and Canadian Wonder Bean. 2nd, Mrs. JENNER, with an exceedingly clean, well-grown collection.

CRAWLEY FLOWER SHOW.

JULY 24.—The fourth annual exhibition of the Crawley and District Gardeners' Association was held on this date in the grounds of Goff's Hill. The weather was favourable, and a large attendance of the public resulted.

Mr. A. B. Wadds (gardener to Sir WEETMAN D. PEARSON, Bart., Paddockhurst), won the

Silberberg Challenge Cup in competition with nine other competitors. Competition was keen throughout the show, and the quality of most of the exhibits was good. There were 450 entries staged by 190 exhibitors, the gardens competition attracting no fewer than 16 entries against the seven of last year. In spite of the fact that three marquees had been prepared to receive the competitors' produce, they were unable to accommodate all that was brought. Several exhibits were placed in outside stalls, and others could not secure even that opportunity for display. The non-competitive exhibits were very numerous and of remarkably good quality.

BRITISH GARDENERS' ASSOCIATION.

JULY 23.—A meeting of the Executive Council was held on the above date in the Royal Horticultural Hall, Vincent Square. Mr. Chas. Foster presided. Six new members were elected, bringing the total membership up to 1,078. One candidate was rejected.

Mr. Lewis Castle was appointed editor of the Society's *Journal*. The question of supplying each member with a certificate for framing was considered. The granting of a special diploma for those members who had distinguished themselves as horticulturists was proposed, and a scheme will be submitted at the next meeting.

A scheme for the examination of gardeners will also be submitted at the September meeting. J. Weathers, Secretary.

DEBATING SOCIETIES.

DONCASTER GARDENERS'.—Forty members of the above association visited, on July 16, the nurseries of Messrs. Clibran, at Hale. The weather was beautifully fine. The stock of trees and shrubs was inspected, also the quarter devoted to Roses where upwards of 100,000 Rose trees are cultivated. The fruit plantations, which are some 15 acres in extent, and the beds of Violas, Pansies and Herbaceous plants were each visited. The glass-houses were also inspected. W. Wenman.

BRISTOL AND DISTRICT GARDENERS'.—A meeting held on Thursday, July 25, was entirely concerned with Sweet Peas. A competition was provided for under-gardeners for the best basket of Sweet Peas arranged at the meeting, and the prize was awarded to Mr. Coombes. Prizes were also offered for six vases of Sweet Peas, and these were won by Mr. Harford and Mr. Garnish. Several of the members spoke for a few minutes upon Sweet Peas, and the chairman, Mr. J. C. House, closed the discussion with a discourse, lasting half an hour, on these flowers. H. W.

CROYDON & DISTRICT HORTICULTURAL.—About 40 members of this society visited Wood Hall Gardens, Dulwich, S.E., on the evening of Wednesday, July 24. An enjoyable time was spent in inspecting the grounds, which in different parts command some excellent views of London. The glasshouses were also examined and darkness set in all too early for the visitors.

CATALOGUES RECEIVED.

ABBOTT BROS., Southall, near London—Fruit preserving bottles, &c.
CHAS. W. BREADMORE, Winchester—Sweet Peas.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending July 31.

Cool days and variable nights.—On the warmest day of the past week the highest reading in the thermometer screen was only 72°, which is but slightly in excess of the average for the time of year. On the contrary, on the coldest day the same thermometer never rose above 60°—or 10° colder than is reasonable. The nights proved very variable, the readings of the exposed thermometer on two of them being respectively as high as 49° and 52°, while on two others temperatures within 9° of the freezing point were indicated by it. At 2 feet deep the soil is now 1° colder, and at 1 foot deep 3° colder, than is reasonable. Rain fell on four days, but to the aggregate depth of only about a quarter of an inch. The percolation gauge covered with short grass, which had been re-started by the two heavy falls of rain in the previous week, has now become quite dry again, while only a few drops of rain-water trickles through the bare soil gauge. The sun shone on an average for less than 4½ hours a day, or for nearly 2 hours a day less than the mean duration for the end of July. The first two days of the week proved very calm, but since the winds have been moderately high, and have come exclusively from some southerly or westerly point of the compass. As was the case in the preceding week the air has remained very damp, the mean amount of moisture at 3 o'clock in the afternoon again exceeding a seasonable quantity for that hour by as much as 10 per cent. A selected Harebell came first into flower in my garden on the 27th. This is not only 15 days later than its average date of first flowering in the previous 15 years, but also later than in any of those years. E. M., Berkhamsted, July 31, 1907.

MARKETS.

COVENT GARDEN, July 31.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.]

REMARKS.—Tasmanian Apples are now nearly finished, Sturmer Pippins being almost the only variety obtainable. French Plums are arriving in very fine condition. Home grown Early Rivers Plum is also seen from the Kent district. English hot-house Grapes are very plentiful and prices for this fruit are low. P. L., Covent Garden Market, July 31, 1907.

POTATOS.

Kents, 3s. 6d. to 5s.; Bedford, 3s. 6d. to 4s. 3d.; Lincoln, 3s. 6d. to 4s.; Blacklands, 3s. to 3s. 6d. Supplies are large and the demand is fair. Prices must fall considerably unless the supply moderates. Trade generally is unsettled owing to the holidays. J. D. C., Covent Garden, July 31, 1907.

COVENT GARDEN FLOWER MARKET.

For the next eight months the market will be open on Tuesdays, Thursdays, and Saturdays only. The past has been a very poor season for many market plant growers, some of whom still have large stocks on hand. *Campanula isophylla* alba, and *C. Mayii* are seen from several growers in good condition. *Coreopsis* is very pretty. *Zinnia elegans* flore pleno can be had in many colours; this is a recent addition to flowering plants in Covent Garden Market. *Lilium longiflorum* is over plentiful at present, but the supplies may fall off at any time. *Hydrangea paniculata* is seen in plants of various sizes, and with fine heads of bloom. One buyer was complaining this morning that he found it difficult to procure good hybrid Perpetual Roses in pots. The best plants are consigned direct to the florist; many other choice plants are not sent through the market. Among "Zonals," *Helargoniums* are very inferior plants. Supplies of show and Ivy-leaved varieties hold out well. *Fuchsias* in well-flowered plants are seen on several stands. Most growers have finished with *Mignonette* for the season. *Spiræa japonica* is well flowered. *Marguerites* with both white and yellow flowers are abundant. *Verbena* Miss Willmott is a conspicuous plant in the market. Ferns, Palms, and other foliage plants are well supplied.

CUT FLOWERS.

Supplies of most subjects are over abundant. Sweet Peas have been the most plentiful, and it has been almost impossible to sell these at any price. I have never seen *Lily of the Valley* offered so cheaply as at closing time in the market this morning (Wednesday). Supplies of *Liliums* exceed the demand. I learn that several market growers are building new houses for the culture of Carnations, so that one may expect the prices for this flower to drop still further. Blooms of *Souvenir de la Malmaison* varieties, owing to excessive supplies, have not been so valuable this season. Roses are cheap. Asters are now coming from French growers in large quantities. Other prominent flowers on the stands are *Alströmarias*, *Stephanotis*, *Gardenias*, *Tuberose*s, also *Gypsophila paniculata*, *Chrysanthemum maximum* and the varieties known as the *Shasta* Daisies; *Coreopsis grandiflora*, *Echinops*, *Gaillardias*, *Achillea*, *Poppies*, *Stocks*, and various other hardy flowers. *Orchid* bloom is rather scarce. *Statice* bloom, in white, blue and yellow colours, is now at its best condition. All kinds of cut foliage is well supplied, but prices do not vary greatly. Some growers clear their stocks of *Adiantum* Fern at closing time for very low prices. *A. H.*, Covent Garden, Wednesday, July 31, 1907.

Obituary.

GEBHARDT SUMMERMEYER.—The death of this gardener at the age of 76 years is announced in the German horticultural journals. He began his gardening career in Nathusius' nursery at Althaldensleben, in Saxony, and after serving in various gardens, he became head gardener to Count Stolberg, at Dönhofstedt, East Prussia. By his efforts the cultivation of hardy fruits in that part of the German Empire was greatly extended, and new methods and valuable varieties were introduced. It is to him that the province is indebted for such remunerative sorts of berried fruits as the red Dutch Currant and Hornet Raspberry, and for the wide distribution of Nathusius' Taubenapfel (Dove Apple), a variety of excellent quality. He had held his post at Dönhofstedt for the long period of 42 years.

GEORGE WARD.—The death of this well-known gardener, in his 73rd year, occurred at Bishop's Stortford, on July 13, from an attack of pneumonia. Deceased was a very successful cultivator of Grapes, and he gained many prizes for this fruit in London and the provinces. He was equally successful in the culture of Melons, and *Eucharis* was also one of his specialities. It is interesting to record that the well-known Grape Gros Maroc was first placed on the market consequent on his keenness of observation. He detected this particular Grape in Messrs. Rivers' nurseries at Sawbridgeworth, and it was at his instigation that it was introduced into commerce. As a judge at horticultural exhibitions the deceased's services were in request, and just before his decease he was appointed to judge the allotments and gardens in connection with the show of the Bishop's Stortford Horticultural Society, of which organisation he was one of the founders. Mr. Ward was the patentee of a trough, that bears his name, for keeping Grapes. Deceased, who retired from active service some few years ago, leaves one daughter.

ANSWERS TO CORRESPONDENTS.

ASPARAGUS STEM FLATTENED: *S. G. B.* The specimen you send is an example of a fasciated stem—a not uncommon condition seen in Asparagus. The abnormality is caused by the fusion of two or more shoots, but what induces this fusion we are unable to say. Fasciation is common in many plants.

BEECH TREES: *W. MacL.* If the shoots are free from any pest and disease we are inclined to think the failure is caused by the roots of the trees having at length reached a medium which is unsuitable for them.

CULINARY PEA: *Gledstone.* We cannot express an opinion on the immature pods you send us. Forward seeds next season to the Royal Horticultural Society's Gardens at Wisley for trial with standard varieties.

CURRANT BUSHES, &c.: *J. W. S.* The shoots are infested with aphides or green fly. Spraying with a mixture of 1 lb. of soft soap dissolved in 10 gallons of water is recommended, but it would have been more efficacious if performed on the first appearance of the pests. The Rose buds do not show any disease, and appear to have been killed by excessive wet.

ERICAS: *East Sussex.* The Ericas you send include, as you suggest, four varieties of *E. cinerea*, one of the common Ling (*Calluna vulgaris*), and one of *Erica tetralix*. It is no uncommon thing to find several different forms of *E. cinerea* in a comparatively small area, and the same may be said of *Calluna vulgaris* and *E. tetralix*. Nine varieties of *E. cinerea* are cultivated at Kew, and these have purple, very dark purple, rose, deep rose, deep red, bright red and white flowers. Of *E. tetralix*, three varieties, in addition to the type, are grown, one of which has white and another deep red flowers. Whilst of *Calluna vulgaris* there are about 25 distinct varieties at Kew, which differ in habit so greatly that, whilst some grow only several inches high, others are capable of growing 3 feet or more high. The colours of the flowers vary from white to pink and pink to reddish-purple and red. The writer has found seven forms of the Ling growing wild on one hill in Cornwall, with several forms of *E. cinerea*; and in the Scilly Islands a form of the Ling quite moss-like in appearance.

GOOSEBERRIES DISCOLOURED: *O. B.* There is no fungus disease on the berries, but the injury has been caused by red spider when the fruits were very young.

GRAPES: *L. S.* The berries are affected with the "spot" disease. Dust the bunches with a mixture of one part lime and two parts of flowers of sulphur.

HOUSE FOR HALF-HARDY PLANTS: *J. C.* We advise you to build the temperate house with the ridge running from north to south. The bulk of the tender or half-hardy plants cultivated in this country require all the sun and air possible when grown under glass, and by building the house from the north to the south, all parts but the northern end of the building will receive a considerable amount of strong light. The northern end might be used advantageously for the raising of young plants of such species as *Rhododendrons*, &c., which prefer a position of this kind during their early stages, or you might utilise it for the formation of a Fernery. The building should be liberally provided with ventilators, and if possible the roof should be so arranged that part of it may be either entirely removed during the summer months or made in two sections so that the upper lights may be allowed to slide down over those of the lower half. Employ large panes of glass, and let all the woodwork be as light as is considered equal to the strength required.

JUNIPERUS VIRGINIANA: *K & B.* Junipers and Cyresses are very difficult trees to identify in their juvenile stages. *Juniperus virginiana* shows at least three distinct forms between the seedling and the adult stages, and each form differs from the others as much as many species do. Therefore the identification of small twigs of young Junipers and Cyresses without cones is necessarily more or less speculative.

NAMES OF PLANTS: *J. M.* *Saponaria Vaccaria*—*R. H. A.* *Tecoma jasminoides*.—*J. I. M.* *Spiræa chamædrifolia*.—*W. G.* 1, *Orchis pyramidalis*; 2, *Habenaria bifolia*.—*J. E. M.* 1, *Nephrolepis exaltata*; 2, *N. e. Westonii*; 3, *N. e. Fosteri*; 4 and 5, *N. e. Piersonii*; 6, *N. davallioides*.—*W. T.* *Collomia grandiflora*.—*Felix.* 1, *Brassia brachiata*; 2, *Oncidium Limminghei*; 3, *Cœlia*

Baueriana; 4, *Ionopsis utricularioides*; 5, *Oncidium triquetrum*; 6, *Aerides virens*.—*Inquisitor.* 1, *Polemonium cœruleum* (not a *Geranium*); 2, *Heuchera sanguinea*; 3, *Centaurea macrocephala*; 4, *Achillea Ptarmica flore pleno*.—*Miss G. C.* We do not undertake the naming of garden Roses.—*Foreman.* 1, *Pteris longifolia*; 2, *Pteris tremula*; 3, *Selaginella umbrosa*; 4, *Adiantum assimile*; 5, *Pteris arguta*; 6, *Asplenium lucidum*.—*E. B.* 1, *Inula glandulosa*; 2, *Aconitum Napellus*; 3, *Clematis vitalba*; 4, *Veronica Andersonii* variegata.—*W. L.* *Orchis conopsea*, common in some districts.

ONION: *A. A. & Sons.* These are known in Covent Garden Market as the Small Globe Silver skinned Onions.

PEA FOR NAMING: *J. P.* The variety appears to be a seedling raised from Lord Anson's Pea, *Lathyrus magellanicus*, after crossing with some white flowered edible variety. It differs from Lord Anson's variety in its vigour of growth, greater substance in the inflorescence, its agglomerate character, and the colour, which is the faintest blue and white, whereas Anson's is bright deep blue.

PEARS CRACKED: *L. S.* The cracking is caused by a fungus—*Fusicladium pirinum*. Drench the trees with a solution of sulphate of iron during the winter, and when the leaves and flower buds begin to expand spray with Bordeaux mixture, and repeat this when the petals are falling and again when the young fruits are the size of Peas or slightly larger. The *Aspidistra* leaves are attacked by thrips and red spider. Use a suitable insecticide, and exercise care in the affording of water to the plants. Your Grapes have the "spot" disease. See reply to *L. S.*

POTATOS DISEASED: *R. L. P.* and *A. S.* The tubers are affected with the "warty" disease, or "black scab." Mix some sulphur in the soil before planting Potatoes on the same ground. In any case Potatoes should not be planted on the same land two years in succession when disease, such as "black scab," has appeared.

ROSE ORANGE RUST FUNGUS: *J. S.* See reply to *D. Bros* in our last issue, p. 80.

STALKED EGGS: *W. E.* The very pretty stalked bodies are the eggs of the Lace-wing fly—*Chrysopa perta*.

TOMATO DISEASED: *W. G. & S. A.* The fruits are attacked by a fungus, *Macrosporium Solani*. You can do nothing to save fruits that are already infested, but the fungus may be prevented from spreading by spraying with the Bordeaux mixture. The colourless patches in one of the fruits points to a lack of potash in the rooting medium.

TOMATO SEEDS: *H. C.* Place the seeds together with as little of the pulp as is possible in a box containing dry, fine sand. Rub the sand and the seeds together, and afterwards sift the whole over a wire mesh of sufficient gauge to retain the seeds but not the sand. Next spread out the seeds to dry, and if they are afterwards shaken together, any sand adhering will become detached and leave the seeds almost clean.

TWELVE BUNCHES OF HARDY HERBACEOUS FLOWERS: *L. C.* *Lilium candidum* is certainly an herbaceous plant, and in the south of England it is perfectly hardy. The schedule of rules for judging issued under the auspices of the Royal Horticultural Society reads:—"The schedule should say distinctly excluding Lilies and other bulbs, corms, and tubers, if it is desired to exclude them; and if such words are not added, it must be understood that bulbs, corms, and tubers are, for garden purposes, included in the term herbaceous plants."

COMMUNICATIONS RECEIVED.—*E. W. K. & Co.* (the flowers have not arrived).—*W. R. P.*, *G. B. M.*, *H. C.*, *X. Y. Z.*—*W. Smith*—*R. H.*—*F. L.*—*F. O. W. McD.*—*J. C.*—*Nympha*—*T. & Son*—*G. G.*—*T. S. C.*—*J. G. W.* (with thanks)—*Derby*—*F. O.*—*P. A.*—*J. C.*—*B.*—*A. T. B.*—*W. H. W.*—*E. A.*—*C. J. G.*—*J. W.*—*E. H.*—*J. V.* & *Sons*—*W. G. B.*—*J. C.*—*Miramir*—*R. B.*—*V. O.*—*I. BATTERSEA PARK.

THIS picturesque park in the south-western suburb of London appears at the present time at its best, as regards the lawns and grass areas, its wealth of native and exotic trees, evergreen shrubs, and its extensive borders of flowering perennials. The trees are now putting forth the tender green tints of that second growth which occurs in July, and affords a lively contrast to the universal dark green of the older leafage. Never has arboreal growth been greater than this year, thanks to the over-abundant rains and low temperature of the summer; and in no year has the grass been greener, or caused the mowing machine to be more actively employed.

It may be noted in the central avenue that runs straight through the park for about a quarter of a mile that the Elms are likely to be short-lived; but from what cause is not apparent, unless it be that the soil, much of it "made up" by Gibson, is insufficiently good to sustain healthy growth for an indefinite period. However, other trees were planted in the winter of the present year, and at a few feet further back from the roadway, and thus in positions in which they will obtain much sunshine and the benefits of the

rainfall. By careful attention in preventing them from becoming overshadowed by the older specimens, these young trees should make rapid progress, and in the course of a dozen years or so, it may be desirable to remove those which now show signs of failing health.

The sub-tropical garden is a sheltered parterre, and it still remains the strongest point of attraction at Battersea on account, not alone, of its varied and pleasing undulated surface and irregular outline, but also for the rich furnishing of the many beds, groups and borders. Mr. Rogers, the present superintendent, is a believer in changes of material, and does not plant out the same mixtures year by year in the beds and borders of this garden, but always contrives to afford new combinations, fresh features, and some novelties from out of his multitude of store houses.

Entering the garden from the north, the visitor will remark the many effective beds of Fuchsias now in the finest bloom, some being many-stemmed bushes, 4 to 5 feet in height, and of nearly the same diameter, and the almost universal employment of Violas as undergrowth or borderings in beds where tall plants are set out. These Violas succeed well, as there is no crowding together of the tall subjects, but each is isolated and shows well from whichever side the bed is viewed. Of excellent varieties of Fuchsia, mention should be made of Mcleworth, which has a double, white corolla and scarlet sepals; the undergrowth is a variety of Heliotrope. Marinka is one of the globose, red-flowered dwarf Fuchsias, and has bronzy-green leaves; and in the same bed were the varieties Lady Roberts, Luzon, and Mrs. Marshall, the last-mentioned variety having white sepals and a red-coloured corolla. In the form of pyramids, in another group, were Pelargoniums of the peltatum section, namely, Murillo, Charles Turner, and some seedlings raised in the park. In another bed were the varieties Baden Powell of the same section, and an undergrowth of a variety of Begonia semperflorens. A bed of the old, yet unequalled, Fuchsia Madame Cornellison, had a good effect, as also had Rose of Castile. Fuchsia Crimson Globe made a charming bed, with Heliotropes beneath, as did Fuchsia Amy Lye, with white sepals and scarlet corolla, associated with the variety Mrs. H. Roberts, having a scarlet corolla and pink sepals.

Succulent plants of species have a place in this garden, giant Agaves being mixed with lowly forms such as Mesembryanthemums, Rocheas, Aloes, Yuccas, Sedums, Sempervivums, &c. An imposing group of Melianthus major, 6 feet in height, with an undergrowth of Viola Mrs. Mills, is very effective. Another conspicuous bed consisting of Carnations (Fancy varieties), Pelargonium peltatum, large bush-grown Fuchsias, and columnar plants of Plumbago capensis, with a yellow-leaved Pelargonium as undergrowth, will present an excellent effect after a little more growth has been made.

The pretty Agatheæ cœlestis, together with Lantana Drap d'Or and Albizzia lophantha as solitary plants, and a dwarf Heliotrope beneath, formed an unusual but pretty combination.

Fuchsia Golden Treasure, a double row of which, pinched and layered, as an edging,

had a nice effect. A group of Abutilon Savitzii, Begonia Triomphe de Lorraine (a variety having reddish-bronze leaves and scarlet flowers), together with blue Lobelia employed as an edging, were very fine.

In another part, near the lake-side, plants of Galtonia candicans, English Irises, and Gladiolus Colvillei, will presently have a distinct effect. Solanum Balbisii, planted in a long bed, is growing into good effect, and the red fruits are showing freely on the plants.

The beds on the Queen's Road side of the park are boldly planted with clumps of the pale purple Stenactis speciosa, Pelargonium peltatum, Golden-leaved Privet, Fuchsias, Chrysanthemum maximum, silver-variegated and Zonal Pelargoniums, Violas in variety, and Pentstemons. A group of Prunus pissardii, 5 feet high, and Golden Privet, filled in between with Clarkia integrifolia, and bordered with Hemerocallis subcordata, at once attracted the attention.

Turner's Crimson Rambler Roses, Hollyhocks, and Dahlias of the Decorative section were employed in the large quadrangular bed near the Queen's Road entrance. Hereabouts, double-flowered Poppies, Malvas, Phlox Drummondii, and Collinsias are used in the borders.

The beds near the riverside restaurant are prettily planted with Violas Bridegroom, Ardwood Gem, and Sir R. Fuller (a blue-flowered very beautiful variety), and are well worth an inspection. Begonias Würtembergi, and B. semperflorens magnifica, &c., are the other plants of which use is made.

In the sunken panel parterre the arrangements differ entirely from those of last year. Here the magnificent crimson Zonal Pelargonium Paul Krampel, Ten-week Stocks of robust growth, and Zelia Pelargonium (one of the best), contribute greatly to the effect. Golden Gem, Robert Fish, Verona and Mrs. Mappin Pelargoniums form distinct edgings in this parterre. F.

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM ARIADNE.

O. NOBILE, ♀ × O. WATTIANUM CRAWSHAYANUM ♂.

THIS is a half-sister, upon the side of the male parent, to Odonoglossum × Astræa, described in the issue for July 20, 1907, p. 42. The sepals are clear yellow, having a small brown blotch at two-thirds distance from their bases. The petals are coloured similarly, slightly lighter towards the bases, having a couple of spots in the same position as that in the sepals. All five segments are otherwise unspotted.

The lip is lighter in tint, having a broad transverse brown blotch on the yellow, just above the crest, where O. nobile is always spotted; its shoulders and channel have small spots and a brown marginal line, which are often present in the female parent. The crest is like that of O. Lindleyanum, slightly more filamentous than in O. × Astræa. The adnation of lip to column plainly shows the influence of O. Lindleyanum, the reniform blade giving evidence of O. nobile.

The column is short and a little up-curved, as in O. nobile, nearly white, the wings being

almost as in *O. Lindleyanum* and slightly spotted. Anther cap light yellow.

This plant is only small, and bore two flowers. It is one of a series of crosses I made with the same male parent, and, compared to *O. x Astræa*, clearly shows the influence of *O. nobile* against that of *O. x Fascinator*, and, through it, that of *O. crispum*. Reversion in this case produces the form of *O. Lindleyanum*, with loss of spotting of the male parent; the white of *O. nobile* assuming the yellow ground colour of *O. Wattianum*. *dc B. Crawshaw.*

NEW SPECIES OF IMPATIENS.

DURING the last few years several new species of *Impatiens* have been introduced to cultivation in this country. The best of these, and certainly the finest plant of the genus now in cul-

position, there is no reason why this species should not be used as a bedding plant when better known. It may be readily raised from cuttings or seeds, the latter of which ripen in abundance.

IMPATIENS HOLSTII (*Gardeners' Chronicle*, July 1, 1905, fig. 7), another recently-introduced species, has speedily become well known in gardens, where it is cultivated both in pots and beds. It is a native of Usambara and Kilimandjara, growing on the banks of streams at altitudes of 2,500 to 5,000 feet, and was introduced into cultivation through the medium of the Berlin Botanical Gardens and the firm of Haage and Schmidt, of Erfurt. The plant closely resembles the well-known *I. Sultani* in its dwarf habit and shape of flowers. It is, however, of much better constitution, and the

panying illustration was eight months old from seed and flowered in an 8-inch pot. As all the seedlings died after flowering and producing seed, there is little doubt but that it is an annual. The flowers are about an inch in diameter, and vary somewhat in colour in the different seedlings from pink to rosy-red or rosy-purple. This species is found abundantly in Ceylon, from the sea level up to 7,000 feet altitude, also on the mountains of Malabar, Canara and the Concan, at altitudes of 3,000 to 5,000 feet. In a recent letter to Kew Sir Joseph Hooker wrote as follows: "I work at the genus *Impatiens* every day and all day. It proves to be an enormous genus, full of most beautiful species. I cannot understand its having been so neglected by botanists, collectors and cultivators." *C. P. R.*

FIG. 40.—*IMPATIENS OPPOSITIFOLIA* IN FLOWER AT KEW.

[Photograph by C. P. Raffill.]

tivation, is *I. Oliveri* (see supplement to the *Gardeners' Chronicle*, October 27, 1906), which was sent to Kew in 1903 from Uganda. It was found to thrive best when given cool greenhouse treatment. The flowers remind one of a *Miltonia vexillaria* in size, colour and shape. It is of floriferous habit, with large, handsome foliage, and a habit that branches freely from the base upwards, causing the plant to form a large and handsome specimen. A single specimen in the greenhouse at Kew at the present time, now about three years old, is more than 10 feet across and 8 feet high, and for the last 2½ years has never been out of flower. When treated as a bedding plant it was found that the flowers lost their pleasing rosy-pink colour on exposure to strong sunshine, becoming almost white. With care in the selection of a suitable

flowers are brilliant scarlet, contrasting well with the light green foliage.

IMPATIENS OPPOSITIFOLIA (see fig. 40).—This species has been known to botanists for many years, but does not appear to have been introduced into cultivation until early in 1906, when seeds were received at Kew (under the name of *I. Dalzellii*, an allied species with yellow flowers) from W. A. Talbot, of Mahabeshwar, India. The plants raised from these seeds grew rapidly under greenhouse treatment, and flowered profusely throughout the months of September and October. Specimens were sent to Sir Joseph Hooker (the authority on the genus), who identified them as *I. oppositifolia*. The species under notice is of very easy culture, of free branching habit, and exceedingly floriferous. The plant depicted in the accom-

TREES AND SHRUBS.

SOME ERICACEOUS SHRUBS.

THE following flowering shrubs are often overlooked in favour of other less ornamental subjects. They all require massing to be properly appreciated, for solitary specimens fail to give a display of flowers or fruits sufficient to show their true character.

PERNETTYA MUCRONATA.

This is a pretty little shrub from the Magellanic region, and a bed of it should be found in every garden, as it is perfectly hardy, and grows well in any soil that does not contain lime in any appreciable quantity. The small, white, bell-shaped flowers are produced singly or in pairs in the axils of the previous year's

growth, and they open early in June. They are followed by red berries, which remain on the plants for the greater part of the winter, and these berries form one of the chief attractions of the plant. *P. speciosa* is usually classed as synonymous with *P. mucronata*, but they differ sufficiently to be separated for garden purposes. In the latter species the leaves are broader and stouter, and the plant is dwarfer and more spreading than in *P. speciosa*, which has a free habit of growth, and rather brighter, narrower leaves. The flowers of both are identical. A number of varieties have received Latin names that describe in each case the colour

The plant is a native of North America, and grows 2 feet or more in height. It is increased by division or by suckers.

RHODODENDRON RHODORA, SYN. RHODORA
CANADENSIS.

This is a deciduous shrub from North America, with slender, upright stems that attain to a height of from 4 to 5 feet with age. The ovate-lanceolate leaves are 2 inches to 3 inches in length, glabrous above and hairy beneath. The flowers are produced in April in terminal clusters, and are of a magenta or purplish-crimson colour, which is very difficult to associate

facturing towns, it is one of the few species that can be relied upon.

It is somewhat curious and interesting that the Elder is also probably the best tree for planting in very exposed seaside situations, and down even to high-water mark, fully exposed to the rough winds from the sea, isolated specimens grow with a luxuriance and freshness that is truly remarkable. No tree is more readily raised from cuttings, is cheaper to procure, or transplanted with greater ease than the Elder. There are several highly ornamental forms of this tree, including the golden, silver, and fern-leaved, and all are equally valuable with the species for general planting.

ULMUS ALATA, THE WINGED ELM.—Considering the ornamental character of this tree, and its capabilities for withstanding the cold in exposed situations, such as on hillsides, it is not planted so largely as its merits warrant. The tree is of small growth, neat in habit, and has peculiar corky excrescences upon its bark. These are regularly disposed on either side of the branches and to such an extent that the smaller twigs look twice their actual size. The species is a native of the Southern United States of America, and, though introduced in 1820, it may still be considered as rare in this country. In Wales I saw it succeeding at an elevation of some 600 feet above the sea level, and where even the hardy Larch was affected by the cold winds of that exposed hillside. Lower down the hillside it was seen in equally good form, and seemed in every situation to be healthy and regularly branched.

THE PINE BEETLE.—This destructive pest of Pine woods would appear to be unusually plentiful this season if one may judge by the numerous specimens of injured wood seen lately. In one instance the trees attacked were isolated from other Pine woods. The only method of dealing with infested plantations is to burn all dead and dying wood, for in this the beetle breeds. A. D. W.

SOLANUM CRISPUM.

This beautiful and free-growing Chilean plant, commonly known as the Potato tree, is generally considered to be but half-hardy, and this belief, no doubt, deters many persons from planting it in the open. *Solanum crispum* is seldom seen in Scottish gardens; but that it is hardy in sheltered positions in Scotland was known as far back as 1841, for the *Botanical Magazine* (t. 3795) of that date records a plant as having flowered at Hafton Gardens, in the Highlands of Argyllshire, where, on a south wall it had reached a height of 14 feet, and had survived the severe winters of 1837-8 and 1838-9.

The species is very robust and free in growing. A specimen planted at the foot of a south-east wall in the Edinburgh Botanic Garden, in 1903, is now nearly 12 feet in height, and since the latter part of June of this year the beautiful bluish-purple and very fragrant flowers have been a conspicuous feature among the dark-green, ovate leaves. The plant requires no special soil preparation, for it grows freely at Edinburgh in a sandy loam. The habit of the plant is climbing, and should a blank wall-space need quickly covering it is specially suitable for that purpose. W. Smith, Edinburgh.

VIEW IN A DONEGAL GARDEN.

WE are indebted to Miss S. M. Wallace for the charming view in an Irish garden, reproduced in fig. 41. The space between the trees affords a fine glimpse of the lough and the hedge-divided fields beyond, while in the background rises a range of hills skirting the horizon. The Rhododendrons and Azaleas, with Solomon's Seal, *Skimmia japonica*, &c., have, in the words of our correspondent, furnished "a gay corner."

[Photograph by Miss Wallace.]

FIG. 41.—VIEW OF AN IRISH GARDEN.

of the berries. The *Pernettyas* are easily propagated by seeds or by division.

LEUCOTHOE CATESBÆI, SYN. ANDROMEDA
CATESBÆI.

This is a plant that may be in full bloom and not be noticed by the casual observer. The stout, arching shoots spring from a common base, and bear white, bell-shaped flowers in short, axillary racemes that point downwards, and which are almost hidden by the leaves. The latter are about 4 inches in length, narrow-ovate in shape, pointed, and finely serrated on the margins. The beauty of the flowers is only seen when the shoots are lifted up, but in June, when they are at their best, they form a welcome addition to the flowering shrubs.

with anything except white. It is a distinct and handsome plant when seen under favourable conditions, and the flowers have the additional merit of looking better under artificial light than they do in the open. Propagation may be effected by layering.

CHEMICAL FUMES AND TREE
GROWTH.

No other tree has been found so suitable for withstanding the deleterious effects of an atmosphere charged with chemical fumes as the common Elder. Several other species of trees succeed fairly well under these adverse conditions, but the Elder succeeds best, and in such a chemically-impure atmosphere as that of Newcastle-on-Tyne, and some other large manu-

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 84-90.)

O, SCOTLAND, N.

ORKNEYS.—The cold, wet season and a lack of sunshine have spoiled the fruit crops in this district, although the prospects in early spring were excellent. Our soil is a heavy loam on a sub-soil of stiff clay. *Thos. MacDonald, Balfour Castle Gardens, Orkney.*

SUTHERLANDSHIRE.—Up to the middle of July the weather was wet, cold, and sunless in this neighbourhood, and easterly winds caused blight to appear on the young growths of Plum trees. Apple trees blossomed freely, but the fruits set badly, and the Apple crop is in consequence thin. Small fruits are plentiful, and promise to be of average quality, although they will be later than usual in ripening. The soil here is a black, sandy loam, resting on gravel and sand. *D. Melville, Dunrobin Castle Gardens, Sutherland.*

1, SCOTLAND, E.

ABERDEENSHIRE.—All small fruits are an abundant crop, especially Gooseberries and Currants, but they will be later than usual in ripening. Apples are a moderate crop only, although I never saw the trees look better than when they were in bloom. *James Grant, Rothienorman Gardens, Rothienorman.*

—A fine show of blossom on all fruit trees early in the season promised grand crops, but the abnormal amount of rain, together with cold, dull weather from the middle of May until the middle of July destroyed our hopes. Apples and Pears will be few: Plums in some gardens promise an average crop. Strawberries are much under the average, but other small fruits are abundant. Up to the time of writing we have had only 10 days of summer weather. *John Brown, Delgaty Castle Gardens, Turrieff.*

BANFFSHIRE.—Fruits of all kinds set remarkably well this season, as the spring here was almost entirely free from frost. But the rains and cold winds during the latter part of May and throughout June partly spoiled the crops, which are about three weeks later advanced than in most seasons. A few weeks of good weather would ensure crops of fruit well over the average in quantity. *George Edwards, Ballindalloch Castle Gardens, Ballindalloch.*

BERWICKSHIRE.—Apple trees early in the season gave promise of an abundant crop of fruits, but continuous cold rains prevailed during May and June whilst the trees were in bloom, and the fruits did not set. Early Strawberries were also a light crop. The first blossoms were destroyed and turned black from the excessive damp and cold weather. Later varieties, however, such as Monarch and Leader, are bearing heavy crops, and the variety Elton Pine promises well. Plums and Cherries on walls, that were protected by nets, &c., are bearing splendid crops. Gooseberries, Raspberries, and Currant bushes are all heavily laden with good fruits. Our soil is a heavy red loam on clay, and the crops in this district are always late. *Robert Stuart, Thirlestane Castle Gardens, Lauder.*

EAST LOTHIAN.—Apples are a variable, but, on the whole, an average crop, and the same may be said of Pears. Stone fruits have seldom set more freely, and this entailed much labour in their thinning. The crops of Gooseberries and Currants are phenomenal, and the weight of the fruits have in some cases damaged the bushes. Royal Sovereign Strawberry furnished a large crop and late varieties promise well, but the maincrop varieties are a failure, owing to a deficient rainfall, and this has caused the Strawberry crop to be below the average. Raspberries, Wineberries, and Logan berries are all promising well. All kinds of fruit trees exhibit health, and have clean, robust foliage. *R. P. Brotherton, Tynninghame, Prestonkirk.*

—The Apple crop in this district is very good, and the fruits promise to be of good quality. Some are already highly coloured, and all are swelling freely. Pears, especially in the case of early varieties, are under an average crop. The trees were exposed to late frosts and cold winds whilst in flower. Plum trees developed an enormous quantity of blossom, but the fruits did not set well, and, save in the case of the variety Victoria, Plums are not more than

an average crop. Peaches and Nectarines are exceptionally good. Apricots are also good, but the crop of these fruits is small. Bush-fruits are very plentiful, but in some places near here Raspberries have been damaged by the caterpillar of the Raspberry moth and Black Currants by the Currant-bud mite. Strawberries promised well, but the recent wet, cold weather has caused mildew to appear, and the berries are not swelling freely. The crops in general are from 10 days to a fortnight late this season. The soil here is a light sandy loam, with a subsoil of almost pure sand. *William Galloway, Gosford Gardens, Longniddry.*

FIFESHIRE.—The fruit crops, with the exception of small fruits, are almost a failure in this district. The weather was exceptionally cold and wet, with frost at night time up to the middle of July. *William Henderson, Balbirnie Gardens, Markinch.*

FORFARSHIRE.—Apples and Pear trees developed an abundance of blossom, but owing to the prevalence of rain and an entire absence of sunshine during the time they were in flower the fruits set badly. Those that did set are late and small. Many of the trees have become blighted, their growths stunted and in some cases the foliage is dropping prematurely. Small fruits are an average crop, but they will be three weeks later in ripening than usual. *Thos. Wilson, Glamis Castle Gardens.*

KINCARDINESHIRE.—There was a magnificent show of blossom on all our fruit trees this season, but the result is somewhat disappointing. The whole of the time the trees were in flower the blossoms were always wet, and especially was this the case in respect to Apples. The weather was also very cold, consequently there were no bees or other insects about to pollinate the flowers. The only variety of Apple carrying more than an average crop is Cellini Pippin, and this kind always does well here. Our soil is very light in texture, the subsoil being gravel. All fruits are very backward, and it is too early at this time to form a correct opinion on their quality. *John M. Brown, Blackhall Castle Gardens, Banchory, Aberdeen.*

MIDLOTHIAN.—Apple trees in the early part of the season promised to furnish fruit in abundance, but with the continuous rains and low temperature later the fruits set very badly. Standard trees of the varieties Lord Grosvenor, Jas. Grieve, Warner's King, Irish Peach, and Worcester Pearmain have large crops, but most of the other varieties of Apples are nearly a failure. Fruit trees trained against walls are bearing good crops. *Wm. G. Pirie, Dalhousie Castle Gardens, Bonnyrigg.*

—The first months of the year were cold and sunless, and fruit trees, more than usually furnished with flower-buds, were late in blooming. A short spell of very fine weather at the end of March caused good "sets" of small fruits and of the earliest varieties of Apples. The cold and sunless weather that followed March, and continued until the beginning of July, spoiled what promised to be a very fruitful season, and our crops are rather under the average. The soil is a light, sandy loam on a subsoil of gravel. *James Whytock, Dalkeith Gardens, Dalkeith.*

PEEBLES—The fruit crops in this district are a distinct improvement on those of the past three years. Small fruits are plentiful, and good in quality, but Strawberries are disappointing, considering the great promise they gave when in flower. The long spell of sunless, wet weather and cold nights prevented the fruits from swelling, and mildew has caused much loss in the variety "The Laxton." Apple trees on the walls are carrying a fine crop of good fruits, but Apples are rather scarce on standard trees. Plums and Cherries are both large crops, and the fruits promise to be of good quality. Our soil is a good loam on a gravel subsoil. *William Young, Stobo Castle Gardens, Stobo.*

PERTHSHIRE.—Late-flowering Apple trees in this district have very poor crops, owing to the wet, cold weather destroying the blossoms. Early varieties of Apples promise to be a good crop. Plums are very plentiful in this district. Peaches, Nectarines, and Apricots are all good crops, but the fruits will be a fortnight late in ripening. Gooseberries are very abundant; also Currants and other small fruits. The soil in this district is mostly a heavy loam. *J. Farquharson, Kinfauns Castle Gardens.*

6, SCOTLAND, W.

ARGYLLSHIRE.—In the spring there was a great promise of all fruits. Apple, Pear and Plum trees had a profusion of blossom, but promises of a good crop have not been fulfilled. In some cases Pear blossom was so abundant that a severe thinning of the flowers was carried out, but, after all, the fruits set badly, and on some Pear trees there is not a single fruit. Morello and Sweet Cherries flowered in remarkable profusion, but many of the fruits dropped off at the stoning period. On the morning of April 18 we had a sudden and disastrous frost, as much as 10° was registered—fortunately the conditions were dry. Peaches set well, there has been very little "blister" disease on the foliage, and the fruits promise to be plentiful and good. Strawberries have cropped splendidly, and the berries were of high flavour. The wet weather has suited Black Currants, which are very good in quality and abundant. Raspberries never fail here, and both Brambles and Loganberries promise well. Gooseberries are good. The recent weather has improved all crops wonderfully. In June 5.13 inches of rain were registered. *D. S. Melville, Pollallock Gardens, Lochgilphead.*

AYRSHIRE.—The cold, wet weather during May and June spoilt what would otherwise have been a good Strawberry year, but only those planted on south borders have yielded satisfactory crops. Currants, Gooseberries, and Raspberries are good average crops, but three weeks backward. Some Apple trees are carrying plentiful fruits, but, generally, the Apple crop is not above the average. Plums on wall trees are abundant, but standard trees are carrying thin crops. Our soil is a heavy loam, and the gardens are in a low situation. *W. Priest, Eglinton Gardens, Kilwinning.*

—All kinds of fruit trees promised abundant crops in the beginning of the season, and with the almost entire absence of frost in April and May a first-rate setting of fruits resulted. The month of June, however, was cold, wet, and sunless, and this caused the fruits of late varieties of Apples, Strawberries, and Raspberries to cease swelling for the time. Good results, nevertheless, appear likely to follow. *D. Buchanan, Bargany Gardens, Dailly.*

DUMBARTONSHIRE.—Red and Black Currants are excellent crops, but Raspberries suffered considerably from cold East winds when the flowers were expanded. Strawberries are a good crop, and the quality improved owing to the sunshine early in July. Our soil is shallow and on a cold subsoil, being very unsuitable for the culture of Apples and Pears. *D. Stewart, Knockderry Castle Gardens, Cove.*

DUMFRIESSHIRE.—Another bad fruit year has to be recorded in this district. Apples, Pears, Cherries, Peaches, Nectarines, Apricots, and small bush-fruits are decidedly under the average in quantity and the quality is very inferior. Plums, Strawberries, and Raspberries are average crops. The climatic conditions during June and the first half of July were so unusually adverse, that little hope can now be entertained of hardy fruits maturing so as to give anything like a remunerative return. Heavy rains and severe hailstorms were very frequent during the month of June, and the temperature was very low both by day and night. On the 10th, 18th, and 25th of that month we experienced 2, 3, and 1 degrees of frost respectively. Our rain gauges showed 6.5 inches of rain for June. *John Mackinnon, Terregles.*

—Small fruits are average crops, Red Currants and Raspberries being the best. Strawberries are good on young plantations, but the berries on older plants are small. Apples are a poor crop; the trees have an unhealthy appearance, especially those bush-trained, and many leaves have shrivelled and fallen off. Pears are always a poor crop here, owing to the soil being light, with sand and gravel underneath. Cherries, and especially Morellos, are looking very well. This has been a very trying year, and will long be remembered. The season is very late, and plants have made very little growth. *Jas. Macdonald, Dryfeholm Gardens, Lockerbie.*

RENFREWSHIRE.—Owing to the cold and wet weather in May and June, the fruit crops in this locality are very deficient. Strawberries are very backward and small in size. Our soil is of a light texture on a sandy subsoil. *Thomas Lunt, Ardgowan Gardens.*

WIGTOWNSHIRE.—Apple trees flowered abundantly, but owing to an almost continual rainfall at the time of blossoming, the fruits failed to set. The trees at the present time present a very unhealthy appearance. Pears are fairly plentiful in the case of young trees, but many of those of older growth are fruitless. Cherries of all kinds are almost a failure, even Morellos. Peaches, Nectarines, and Figs are plentiful, and promise to ripen well. Small and bush-fruits are generally abundant and of good quality. Our soil is a good, somewhat heavy, loam, resting upon a substratum of gravel or rock, from which water easily escapes. *James Day, Galloway House.*

2, ENGLAND, N.E.

DURHAM.—All trees had an abundance of blossom, but, owing to the cold rains, Apples did not set well. Strange to say, Plums are above the average. Our fruit trees are not pruned. The soil is limestone. *R. Draper, Seaham Hall Gardens, Seaham Harbour.*

YORKSHIRE.—The early promise of hardy fruit crops was excellent, but the fruits failed to set, owing to low temperatures, cold rains, and sunless weather in May and June. *J. Simpson, Studfeld House, near Sheffield.*

— Apples, with very few exceptions, are a heavy crop. Pears are an average crop. Plums are an exceptionally heavy crop. Strawberries suffered very severely during the wet month of June, and the only satisfactory crop was from the variety Royal Sovereign. Raspberries are very good, and small fruits generally are above the average. The soil here is a good loam 2 feet in depth, resting on a layer of clay, beneath which is a gravel subsoil. Fruit trees succeed well in this district. *J. E. Hathaway, Baldersby Park, Thirsk.*

— As a result of the fine summer and autumn of last year, all fruit trees showed an abundance of blossom. Much of this was destroyed by frost and cold winds, especially on Apple trees, hence the present poor crop on old and exposed trees, but young trees seem better able to withstand the effects of cold. Bush fruits are plentiful and very good. Strawberries suffered from drought last year, and made a weak growth. Early kinds of Potatos are not very satisfactory, but they have much improved with the advent of warmer weather. Late Potatos promise well. All crops this season are about three weeks later than usual. The soil is a rather strong loam resting on clay over chalk 150 feet above sea level. *John Allsop, Dalton Hall Gardens, Dalton Holm, Beverley.*

— There was an abundance of blossom on all fruit trees, but the continuous wet and sunless weather prevented the fruits from setting. These adverse climatical conditions continued until the beginning of July, hence all fruits are backward. Gooseberries are very abundant. Strawberries were injured by the rains. Generally, the older varieties of Apples and Pears are bearing the heaviest crops. The soil varies from a stiff loam, resting on limestone, to lighter loams on the edge of the great alluvial plain of York. Troublesome insects are this season less prevalent than usual. *Henry J. Clayton, Wharfe Bank House, Ulleskelf.*

— Apples are a very thin crop, especially on old trees; young trees of Lane's Prince Albert, James Grieve, Cox's Orange Pippin, Adams' Pearmain, Irish Peach, and Grenadier have the most fruits. Pears are very scarce. Plum trees are very heavily cropped, especially the variety Victoria. Damsons are also a very heavy crop. All bush fruits are good. Strawberries are very late in ripening, and there is only half a crop of these fruits owing to the recent long spell of wet, cold weather. Apricot trees are carrying very heavy crops. *A. E. Sutton, Castle Howard Gardens, Welburn.*

3, ENGLAND, E.

CAMBRIDGESHIRE.—The soil here is very light, consequently the recent rains have done much good to all crops except Strawberries. Many of these fruits rotted on the plants before ripening. The Peach, Nectarine, and Plum crops are all excellent. Apples in some cases have set too thickly, so that the quality of the fruits cannot be good. *R. Alderman, Babraham Hall Gardens, Cambridge.*

— Considering the dull, sunless weather experienced recently, the hardy fruit crops are

promising fairly well, Peach, Nectarine, Morello and Sweet Cherry trees have been very much infested with green and black aphid and red spider. Trees of Jefferson and Greengage Plums that were root-pruned last autumn, also Kirk's and Coe's Golden Drop, are carrying fair crops of fruit. If we get several weeks of sunshine, and a fine autumn, the fruit crop will be much benefited. Our soil is a strong loam resting on clay. The average rainfall for the year in these gardens is 20.25 inches. *T. W. Birkinshaw, Hatley Park Gardens, Gamlingay.*

ESSEX.—This season promised to be a record one for fruits of all description in these gardens, but the continuous cold and sunless weather has destroyed the crops. In the case of Strawberries, a large number of the early berries rotted before ripening. But the crop was a heavy one, and with the recent fine weather the latter fruits ripened, and on the whole the yield has been a good one. Aphid, both green and black, have been very troublesome on Apple and Cherry trees. The Apple crop will neither be heavy nor good, from this cause. Pears, Apricots, Peaches, Nectarines, and Plums are particularly good. A free growth of wood in fruit trees generally has been made. The soil is a stiffish clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

— Established trees of such varieties of Apples as Hambling's Deux Ans and King of the Pippins, which last year bore 19 bushels and seven bushels of first-rate fruit respectively, are this year, as is usually the case the season following a bountiful crop, quite bare of fruit. This I attribute to the trees having become exhausted in the developing and ripening of such heavy crops of fruits as to prevent them from expanding any blossoms in the spring. A specimen of Norfolk Beefin is the only established Apple tree that has a fair crop of fruit this year, but young maiden Apple trees, which last summer and autumn made no wood-growth, but formed plenty of plump, well-ripened fruit-buds, have set good crops of fruits. The soil is a sandy loam resting on a bed of clay; the ground slopes to the south. *H. W. Ward, Lime House, Rayleigh.*

LINCOLNSHIRE.—Notwithstanding the wet and cold weather, there are good crops of Peaches, Nectarines, Apricots, and Plums, especially the variety Victoria. Strawberries were greatly injured by rains; many have rotted, and generally the berries are a bad colour and poor in flavour. Apples are a short crop notwithstanding there was a fair quantity of blossom, but it was small and weak and failed to set. Pears are a rather better crop than that of last year; the trees had a wealth of blossom, but the blooms suffered from a sharp frost after a cold rain. We need plenty of sunshine to bring the crops to perfection. Our soil here is a brown loam on a blue clay or ironstone subsoil. *H. Vinden, Harlaxton Manor Gardens, Grantham.*

— Considering the cold, wet spring and early summer, Apples are a fair crop; the variety Blenheim Pippin is very promising. Pears are an average crop, but Cherries are very scarce. Nectarines and Peaches are excellent. Apricots are also very fine fruits this season. Pear, White, and Black Currants are plentiful. Gooseberries are a very heavy crop of large fruits, and the Loganberry is excellent. I consider this latter is one of the most reliable of fruits. Raspberries are abundant, and the fruits are very large. Strawberries have been an average crop of good fruit. Walnuts and small nuts are scarce. Taking the fruit crops generally, the season is one of the best for many years. The soil in this district is very heavy, on a cold, clay subsoil. *F. J. Fleming, Weelsby Old Hall Gardens, Grimsby.*

— The soil in these gardens is a heavy clay, but the borders have been specially prepared for the planting of Pears, Apricots, Peaches, and Nectarines at the foot of walls. Of Strawberries, Royal Sovereign is almost the only variety which does well with us. A severe hailstorm on July 2 badly marked the exposed Apples and many Nectarines on a south wall. A bad attack of caterpillars infested the trees early in the season. The extremes of temperature experienced between the early summer months and the past few weeks have proved a great check to Apple trees, and, in consequence, many of the fruits have dropped, together with some of the foliage. *F. C. Stainsby, Brocklesby Park Gardens.*

— The soil here is of a light sandy nature, and rests on a bed of white clay; these conditions do not suit the Apple, and after the trees have been planted about 20 years they gradually die, but they produce fairly good crops whilst they are young. Small fruits, and especially Currants, do remarkably well here. Nuts are quite a failure this year, owing to the cold weather. *F. Barton, Hainton Hall Gardens.*

NORFOLK.—Apples set well, but lately they have dropped badly. Amongst small fruits, Raspberries, Red, White, and Black Currants are plentiful, but Gooseberries are a much lighter crop than last year. Plum trees blossomed well, but the young fruits dropped freely. Walnuts are quite a failure this year. *J. Wynn, Sedgeford Hall Gardens, King's Lynn.*

— Apple trees were covered with blossoms, but Caterpillars destroyed the prospects of a bounteous crop. Pear trees had not much blossom, owing to excessive wet. Early Strawberries were almost a failure, but later varieties are very good, especially Waterloo and Givon's Late Prolific. Cherry trees trained against walls are badly infested with black fly. Potatos generally are looking well and promising a bountiful crop of tubers. Owing to the heavy rains Peas have grown quite out of their normal character, and the pods are a long time in filling, owing to an absence of sunshine. *J. W. Bradbrook, Ketteringham Park Gardens, Wymondham.*

SUFFOLK.—The season has been very unfavourable for fruit of all kinds, owing to the unpropitious weather in April, May, and June. During July the weather has improved, and we still hope to have a good crop of large fruits. All kinds of fruit trees around this district showed an abundance of bloom, and with one or two exceptions the fruit set well, the exceptions being a few Pear trees, principally of the variety Duchess d'Angouleme that were in full bloom on April 27, when we registered 6° of frost. Strawberries promised well in the early stages of fruiting, but although an average crop has been procured, the quality has been very poor. All other small fruits, such as Currants, Raspberries and Gooseberries, have been abundant, and the market growers have complained of the very low prices. The soil in this district varies from a heavy to a light loam on a gravelly subsoil. In these gardens we have rather a light soil lying on a bed of sand and gravel. *Thos. Simpson, Henham Gardens, Wangford.*

(To be continued.)

THE ALPINE GARDEN.

PHYTEUMA CHARMELII

THIS is a very suitable plant for the Alpine garden. It grows about 12 inches in height and produces a number of violet-blue flowers. The foliage is linear-lanceolate in shape and of a dark green colour. It is quite hardy, and, unlike other varieties, it is easy of culture. When planted in ordinary sandy soil in a position that is exposed to sunshine, it needs nothing further than an occasional watering to ensure success. *W. G., Somerset.*

SEDUM ACRE.

ONE is frequently asked to name a plant that will grow and thrive upon the driest bank, amid stones, or in places where only a limited quantity of soil exists, and I know of no dwarf plant better suited than the common Stone-crop. Those persons who have seen the plant in flower in the neighbourhood of Michelham Downs, where it carpets the soil by the acre, will know somewhat of its value even as a flowering plant. In that district, hillock and mound and dale are often clothed with Sedum acre, and the mass of greenish-golden blossoms which it produces in its flowering season is most beautiful. Recently I saw it growing upon the almost perpendicular railway banks between St. Mary Cray and Swanley Junction on a very sandy or stony soil. A good plan of planting Sedum acre on steep and sun-scorched banks is to gently rub a few tufts of the plant through a sieve of not larger than a half-inch mesh, mixing the particles with soil and then sow the mixture on the bank. The best time for sowing these tiny pieces of the plant is during the autumn season.

CONVOLVULUS CNEORUM AND VERONICA HULKEANA.

CONVOLVULUS Cneorum is a native of southern Europe, whence it was introduced into this country in 1640, so that it has long been known in our gardens. Unfortunately it is not a truly hardy plant, and in cold localities, and during exceptionally severe winters in warmer spots, is often killed. It is a charming, flowering shrub, and blooms with such freedom as to entitle it

of excessive moisture during the cold weather. In the mild climate of the south-western counties, however, the winter rains do not harm them. The species is easily increased by cuttings, which make roots freely in sand under a bell-glass. The plants grow rapidly, the specimen illustrated at fig. 42, now over 3 feet in height, with a spread of 5 feet, having been planted as a rooted cutting only four years ago. The photograph was taken at the end of May, when the

a native of New Zealand, and was first known in England in 1865. The plant, part of which is here shown, is an exceptionally large one, being nearly 6 feet in height and 8 feet across. When in full bloom, at the end of May, it presents one of the most charming sights possible, the countless, branching flower-sprays, standing out from the wall and slightly drooping, forming a cloud of soft lavender colour from the ground level to the topmost shoot. Many of these flower-sprays are 2 feet in length. Everyone who sees this *Veronica* in flower is delighted with it, and certainly when at its best it is the glory of the garden. It is seen to the greatest advantage when trained to a wall, as, if left to itself, it forms a loose-growing bush. The species is supposed by some to be very tender, but this is not so, as it has remained unharmed when other shrubby species have been seriously damaged by frost. The species has, however, the unfortunate habit of dying off suddenly without any apparent reason. Small plants die in this manner as well as large ones, but the loss of a fine specimen is a deplorable loss to a garden. Possessors of large examples are naturally on the look-out for signs of failing vigour, but when such appear, the fate of the plant is sealed. The death of the plant is, by some, attributed to the strain of flower and seed-bearing, but even small plants with not a dozen flower-sprays sometimes die. It is, however, well to take every precaution to prevent the plants being weakened, and it is wise to cut the flower-sprays as soon as they have reached perfection. This has been done for several years with the specimen under notice, and this season over 500 bloom-panicles were cut on May 25, and the plant is at present in robust health. Cuttings, a few inches in length, taken off with a heel during the late summer and early autumn, strike readily. *S. W. Fitzherbert, South Devon.*

FIG. 42.—TENDER FLOWERS IN A DEVONSHIRE GARDEN: *CONVOLVULUS CNEORUM* BELOW, AND *VERONICA HULKEANA* ABOVE.

to a place in every rock garden in the warmer localities. It also does well against a south wall, especially if this be the wall of a hot-house, which will give out a certain amount of heat during the winter months, as this will tend to prevent its injury even in comparatively cold climates. Its narrow, silvery leaves, $2\frac{1}{2}$ inches in length and $\frac{1}{4}$ inch in breadth, are clothed with silky hairs, and this renders the plants impatient

plant was in full flower, but it blooms more or less through the whole year, a few blossoms being now expanded (July 20), and it also, generally, has blooms again in autumn. The flowers are pure white, flushed with pink on the reverse, and are $1\frac{1}{2}$ inches across.

The other plant in the illustration is portion of a fine specimen of *Veronica Hulkeana*, by far the most beautiful of the shrubby species. It is

ORCHID NOTES AND GLEANINGS.

CORYANTHES SPECIOSA.

THIS singular species is flowering in the gardens of the Hon. N. Charles Rothschild, Ashton Wold, Oundle (gr. Mr. J. Wells). The large flower, whose singular formation to attract insects for the purpose of securing pollination was described and illustrated in the *Gardeners' Chronicle*, xxi. (1884), p. 482, xxiii. (1885), p. 144, and xxiv. (1885), p. 103, is yellowish with a slight rose shade and an orange tint inside the helmet. The membranous, wing-like sepals are thrown back, and the singular, fleshy labellum composed of a helmet-shaped hypochil, a neck-like mesochil, and the large "bucket" or epichil which catches the secretion which drips from the horns above. The whole flower is an interesting study.

Coryanthes, like *Stanhopeas*, should be grown in baskets, and suspended in an intermediate house. They require but little potting material around them, for in their native habitat they have no other material than the masses formed by their own roots.

CIRRHOPE TALUM MACULOSUM.

AN inflorescence of this pretty species, which is often known in gardens as *Bulbophyllum umbellatum*, is sent by Mr. Wilkinson, The Gardens, Cliffe Cottage, Rawdon, Leeds. The scape, which is 6 inches in height, bears a terminal head of nine flowers, each about $\frac{3}{4}$ inch across. The sepals and smaller petals are of a pale, greenish-yellow tint, evenly spotted with purple, and the column-foot and delicately-poised labellum are white, densely spotted with bright purple. The short-winged column has a horn on each side of the anther-case. The species is a native of Nepal and the lower Himalayas, and it is an easy plant to grow in the intermediate house.

BULBOPHYLLUM SANDERIANUM.

THIS singular species, which is sometimes imported with *Cattleya labiata*, is also sent by Mr.

Wilkinson. The inflorescence is 15 inches in length, furnished with bracts to the number of about 40, the lower ones not producing flowers, and the upper bracts producing them in succession, so that only three or four are perfect at one time. The flowers are about $\frac{1}{2}$ inch in length, the sepals green, spotted and striped with purple, the small petals whitish, and the labellum, which is $\frac{1}{2}$ inch in length, is purple, feather-like, and easily moved by the air, or by changing the position of the flowers.

COLONIAL NOTES.

ECONOMIC PLANTS IN THE BRITISH COLONIES.

REPORTS on economic or industrial cultures in the various Colonies continue to reach us. As the Agricultural Department of each Colony becomes more efficient, its value to planters and others is more generally acknowledged and it is utilised as a means of promoting the cultivation and extension of economic plants and a knowledge of their uses and developments throughout the world. From a batch of these official publications before us, we select a few for special notice as indicative of their general character and of the value of their contents. It will be seen that they represent a wide geographical range.

From South Africa comes *The Agricultural Journal of the Cape of Good Hope*, the contents of which are as varied as they could possibly be. It includes a note on the possibility of the cultivation of the fibre-nettle, Ramie, on a commercial basis in South Africa, and the continuation of a very elaborate "Treatise on Citrus Culture from Seed to Fruit," besides other articles on plant diseases, and one on the "Wool Trade of the Cape." To show what liberal means are adopted for the dissemination of this journal, it may be stated that on the first page the following announcement is printed: "Published monthly in English and Dutch by the Department of Agriculture, and distributed gratis to bonâ fide farmers in the Cape Colony on application through the Resident Magistrate of the district." From New South Wales and Queensland comes the *Agricultural Gazette* and the *Agricultural Journal* respectively. The former opens with a continued article by Mr. P. H. Maiden on "Some Practical Notes on Forestry suitable for New South Wales," illustrated by photographs of trees of *Ginkgo biloba*, *Torreya nucifera*, *Podocarpus elata*, and *Prumnopitys elegans*. Under the title of "One of the So-called Quinines of N. S. Wales," Mr. Maiden has another paper on a Euphorbiaceous tree of New South Wales and Queensland (*Petalostigma quadriloculare*), the bark of which has a powerfully-bitter taste, and was said, at one time, to possess similar properties to quinine. This question, however, seems to be set at rest adversely by a report of its investigation at the Imperial Institute, from which the following is a quotation: "The results of the investigation show that preparations of the bark do not exert any marked physiological action. In consequence, it does not appear that the bark can be utilised for any important medicinal purpose." Referring to this report, Mr. Maiden says that it confirms the investigation of Dr. Thomas Bancroft, of Brisbane, and shows that a once-reputed drug of New South Wales is now proved to be of no practical value. The *Queensland Agricultural Journal* shows an equally variable contents dealing with tropical industries, under which are included "The Cultivation of Rubber for Tropical Australia," "Ramie for Queensland," and "Pipe Tobacco in Australia." The first is a thorough consideration of the subject from its botanical, cultural, and commercial aspects. Besides these articles dealing with economic

plants, there are others on dairying, poultry, and kindred subjects.

As might be expected, the literature issued by the Imperial Department of Agriculture for the West Indies has a wide range of matter, including, as it does, reports of experiments in the numerous economic cultures carried out at the several botanical stations. The experiments with seedling and other Canes in the Leeward Islands are fully reported, and the value of these experiments and reports is confirmed by a note to the Commissioner of Agriculture by Dr. Francis Watts, C.M.G., who has charge of these experiments. He says: "The introduction of new varieties of Sugar Canes is a subject of great interest to the planters in the Leeward Islands, both in connection with the increase in the yield of Sugar, and, perhaps, even more especially in connection with the combating of pests and diseases." *The Agricultural News*—the fortnightly organ of the Imperial Department of Agriculture for the West Indies—maintains its reputation for variety and interest, and is an excellent medium for the diffusion of scientific and practical knowledge amongst planters and others interested in the welfare of our West Indian Colonies. The same may be said of the *Bulletin of the Department of Agriculture*, published at Kingston, Jamaica, and edited by Mr. W. Fawcett, F.L.S., &c., Director of Public Gardens and Plantations in that island. It is worth noting, again, that in the case of this publication, the price of which is threepence, that the following note appears on the cover: "A copy is supplied free to any resident in Jamaica who sends his name and address to the Director of Public Gardens and Plantations, Kingston."

NOTICES OF BOOKS.

FLOWERS OF THE FIELD.*

WHEN a book, though excellent in its day, becomes more or less obsolete through the advance of knowledge, we welcome a new edition which retains all the old familiar features, but is accurately corrected in every point wherever necessary, so that the reader will not be misled. Such has been the case with the now valuable edition of the Rev. C. A. Johns' *Flowers of the Field*. It has been revised by Professor G. S. Boulger, and published by the Society for the Promotion of Christian Knowledge. Messrs. Routledge have now issued an edition nearly similar to the original, retaining the erroneous and now misleading details in the introduction, such as underground stems described as roots, the embryo confounded with the plumule, certain fruits described as seeds, &c. Some of these Mr. Clarence Elliott has repeated in the new glossary which is added. He has also written *celeratus* for *sceleratus*, correctly given in the Rev. Johns' text. He also omits all accents, instead of improving the text by adding others where omitted. Beginners are much perplexed as to how to pronounce Latin names, as *Clemâtis*, which is often wrongly pronounced *Clemâtis*.

Mr. Elliott says in his preface: "To have made a thoroughly scientific book of it was deemed inadvisable;" but it is most desirable for a book of botany to be strictly accurate. To be accurate is to be scientific. The new feature in the book is the addition of 92 plates containing 268 coloured figures by Miss E. N. G. Watkins. These may attract the reader, but in some cases they are not so good as those in the original; such, e.g., as the Lesser Celandine, in which the peculiar roots are omitted. With regard to the figures in the text, these are all similar to those in the Rev. Johns' text, but they are not improved by being greatly reduced in size. With regard to the number of illustrations, in the large family Cruciferae, the

original work had 28 good-sized figures. This edition has 22 in the text, and one plate of 4, so there is no gain in this respect. The coloured figures are very small, and no botanical (structural) information is to be gained from their flowers, although they may help in the hasty determination of a species. We do not know why Mr. Elliott changes *Dentaria* into *Cardamine*; neither Bentham nor Hooker recognise it as belonging to the latter genus. As a rule, only a few alterations of no great moment are made in the text, some rarer species being omitted.

On p. 289, Mr. Elliott introduces the heading, "Sub-Class II. Glumaceæ" over "Juncaceæ—Rush Tribe," and subsequently heads every left-hand page "Glumaceæ," in which he includes eight "Tribes," not one of which belong to Glumaceæ at all! In the Rev. Johns' work the only two families, grasses and sedges, which the British Glumaceæ contain, are added in an appendix (rightly embodied in the text by Boulger). These are omitted by Mr. Elliott altogether.

Professor Boulger's volume is 6 $\frac{1}{2}$ inches by 5 inches in size, whereas Mr. Elliott's is a thick octavo.

Professor Boulger's edition is thoroughly up-to-date, the families being re-arranged in accordance with the best floras of the day, and not in the obsolete grouping adopted by the Rev. Johns, which is retained by Mr. Elliott.

Beginners want to learn and remember the usually accepted sequence of the families (not "Tribes," as the Rev. Johns calls them). If they begin to study wild flowers with Mr. Elliott's edition, they will have to unlearn much when they come to use Hooker's *Students' Flora*, or Bentham's *Handbook of the British Flora*. H.

THE BOOK OF NYMPHÆÆ.*

WE have in *Das Buch der Nymphaeaceen oder Seerosengewächse*, as its title runs in the German language, a work by F. Henkel, landscape gardener, Darmstadt (assisted by F. Rehnelt and L. Dittman), which is most opportune at the present time, when the culture of aquatics is rapidly extending. The author supplies an introductory chapter on the history of the genera, which are among the oldest plants on the earth, being coeval with the Saurians, whose remains are found in the chalk strata. In that age, which preceded the Ice Age, when Europe, so far as the 50th degree of northern latitude, was covered with sub-tropical forests, Nymphaeas with far larger blossoms than are now found in the tropics, grew in the waters among Palms, Camphor Laurels, and Cinnamon trees: and in appearance the plants differed but little from those of the present day. Among the ancient inhabitants of Europe the rootstock of *Nymphaea alba*, which is rich in tannin, was employed as a medicine; and in the remains of the pile dwellings in Switzerland traces of the plant have been discovered. The reader is given a list of books which treat of the subject, viz., Linnaeus, who wrote of four species in 1771; Curtis, in the *Botanical Magazine*, in 1801, in tab. 552, gives the first picture of a cultivated Nymphaea, *N. Capensis*; followed in the next year with the North American *Nuphar advena*; 1805, *Nymphaea odorata* and *N. thermalis*, and the following year *Nelumbium speciosum*. De Candolle's *Prodromus*, 1824, gave 24 species. With the introduction of the Victoria regia at the middle of last century, interest in aquatic plants, and, more especially tropical and hardy Nymphaeas, was awakened.

The favour with which the coloured hardy hybrids are now regarded began when the prices of the plants became moderate.

A short chapter is given concerning the botanical position of the Nymphaeas, which, according to Engler, consist of *Nelumboideæ*, *Cabomboideæ*, and *Nymphaeoidææ*. The characteristics of these three sub-genera are given briefly, and the following chapters are devoted

* *Flowers of the Field*. By the Rev. C. A. Johns. Edited by C. Elliott (8vo., pp. 316). G. Routledge & Sons, 1907.

* Published by Friedrich Henkel, Gartenarchitekt, Darmstadt, Neuviere. Price 10mk.

to the geographical distribution of the plants, properties, and uses of *Nelumbiums*. There is a good list of species, garden forms, and hybrids in alphabetical order, with statements as to origin, year of introduction, name of introducer or raiser, form of bloom and colour, size of the bloom in centimetres, and general remarks.

The observations in regard to cultivation are most useful, giving as they do the sorts of soil and kinds of manure to be used, depth of water, temperature of air and water, the rearing of plants from seed and from rhizomes, and of cultivation in the open air. The discovery of the *Victoria regia* and its introduction have a chapter to themselves. The *Nymphæas* are treated similarly to the *Nelumbiums*, and owing to their being the more numerous group, they occupy a much larger portion of the book. In both, the text is furnished with illustrations of the leaves and blooms in outline, and reproductions of photographs of views taken of plants in glasshouses and out-of-doors.

A list of the hardy species of *Nymphæas* and hybrids is given in the same manner as is the case with *Nelumbiums*. The remarks on cultivation are very full and satisfactory. The illustrations number more than 100.

DIE MODERNE TEPPICHGARTNERIA (MODERN CARPET BEDDING).

THOSE of our readers conversant with the German language will find in this book, furnished with 172 plans of beds and parterres, a selection of new designs for planting, which differ in many particulars from those hitherto seen in gardens in this country or abroad. The work—the 7th edition—is an improvement and enlargement of the previous editions by the same author, and eminent specialists in this field have furnished many of the new designs given.

The work is by W. Hampel, and it is published by Paul Parey, Berlin, price 6s.

The Week's Work.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Manure water.—Many plants and shrubs just showing signs of flowering will benefit greatly if given several applications of manure water. The best time to afford manure water is when the soil is in a moderately moist condition. Take care that none of the liquid touches the foliage of the plants, and as soon after as the soil is in a fit condition lightly hoe the surface. If the weather continues hot and dry, a mulching should be applied.

Summer bedding.—While the plants used for summer bedding are at their best condition, it will be wise to take notes of those that have succeeded best, and of those which have failed. These notes will be of service in formulating plans for next year's bedding. At the present time any suggested changes may be better considered than would be the case later in the year, and it also allows ample time for securing the necessary stock of plants. A start should now be made towards this end; the plants in the reserve garden may be depleted of as many cuttings as they will yield, but in the flower-garden proper cuttings should only be taken from those plants which have made a free growth. During the succeeding four or five weeks, cuttings of *Heliotrope*, *Alternanthera*, *Fuchsia*, etc., will root readily, if firmly inserted in suitable soil in cold pits that are shaded and kept closed. Providing that the weather is not excessively wet, cuttings of *Pelargoniums* will root better out of doors than under cover.

Violets.—All runners should be frequently removed from these plants in order that growth may be restricted to one crown. If red spider is present on the foliage, a few syringings with either weak manure water or an infusion of *Quassia* chips will act both as a remedy and as a preventive. The frequent use of the Dutch hoe about these plants is beneficial.

Preparations for planting.—Recently-layered *Carnations* and such other plants as seedling *Campanula pyramidalis*, *Anemones*, and *Ranun-*

culuses will, from time to time, need planting in their permanent beds. The ground for their reception should be early prepared, which is advisable for many reasons: it allows time for the soil to become aerated and mellowed, and many quickly-germinating weeds grow and can easily be destroyed before the plants are placed in the beds. Where the autumn sowing of annuals is practised, the ground for the reception of these seeds should be manured and dug as early as circumstances will permit.

Spartium junceum.—Always a free-flowering shrub, the Spanish Broom has this year made a more gorgeous display than I can remember. A packet of seeds sown just over seven years ago furnished a stock of plants which now, although growing in a light and rather poor soil, are over 10 feet in height and almost as much through. This species is especially valuable, as it continues to flower freely till after September, when showy flowering shrubs are scarce. Rabbits greedily eat the young shoots, therefore in places in which these animals abound, wire netting must be placed as a guard around the plants.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq., Norwood, Alloa, Clackmannanshire.

Cucumbers.—Plants in pits, and which have been fruiting for the last three months, should now be pruned hard back. At the same time, remove to a depth of 2 or 3 inches the old surface soil and replace this with a rich loam. Afterwards give a good soaking of warm water to the roots. The plants may then be expected to start into fresh growth, and furnish a plentiful supply of fruits in the autumn. Syringe the foliage freely to guard against attacks of red spider.

Orchard-house trees.—Apple and Pear trees in pots perfect their fruits much better when they are plunged out-of-doors at this season. They should be placed in a sunny position on a well-sheltered border facing south. Coal ashes form the best material for plunging them into. The fruits should be protected from birds by nets placed over the trees, and as soon as they commence to colour, a piece of soft twine should be tied to the stalk and affixed to the nearest branch for support. Give the trees an abundance of water at their roots, and as often as two or three times a day during very hot weather; an occasional application of liquid manure will also prove beneficial. Reduce the supply of water when the fruits commence to colour, and at that stage discontinue the applications of manure water. The trees planted in the orchard-house should be syringed daily, and be afforded plenty of moisture at their roots. Allow an abundance of ventilation both by day and by night. All trees in pots that are cleared of their fruits should be plunged out-of-doors to ripen and mature their shoots.

Melons.—As soon as the fruits begin to colour, the amount of water applied to the borders should be reduced, but not so as to cause the foliage to flag, for this will affect the flavour. If the borders have been mulched, the litter will greatly assist in retaining the moisture in the soil.

Successional plants that are intended to furnish Melons about the end of August or the beginning of September will now be freely setting their fruits. These plants must be carefully watered, and the bottom heat must not be allowed to decline, especially at night-time and after waterings. Keep the atmosphere of the house moist both by day and by night, and besides admitting fresh air throughout the day leave the top ventilators open a trifle at night-time. Secure the fruits to the trellis with soft twine, and stop the fruiting shoots at one leaf beyond the fruit, but allow a few of the growths at the top of the plant to remain entire, in order to encourage a free root action.

Tomatos.—Plants growing in pots or in borders should have an abundance of fresh air about them both day and night during hot weather. Afford the plants copious supplies of water at their roots and manure water twice a week. Apply a top-dressing of fresh loam and manure to all plants that seem to require feeding. Train the plants to a single stem, and remove all lateral growths as they appear. Pinch the main shoot as soon as it reaches the top of the trellis. Plants in 6-inch pots that are intended for

furnishing a supply of fruits in winter should now be potted into 9-inch pots. After re-potting, afford the roots water and place the plants in a cold pit or frame, where they will grow sturdily till placed in their winter quarters. Seeds of the variety *Winter Beauty* should be sown for a later batch of plants.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Chrysanthemums.—These plants have now filled their pots with roots, and will require much water, for at no time must they be allowed to suffer from dryness. Afford slight applications of stimulants, but do not over-feed the plants, or rank, soft growth will result. The necessary tying of the shoots, "taking" the buds of the more forward varieties, and the removal of side shoots must be performed. Superfluous shoots must be removed early, and not at the stage when their removal will cause a check to the plants. Guard against aphids by puffing powdered tobacco on the shoots, and be on the watch for mildew, which is easily combated at its first appearance.

Freesias.—If these plants are required for flowering at Christmas time, they should now be potted. Having shaken the old soil from the roots, grade the bulbs and place those of equal size together, for if they are potted indiscriminately in different sizes, the plants will be very irregular, and the smaller bulbs will probably not flower. As a rooting medium, use a compost consisting of loam and leaf-soil mixed with plenty of sand. If the soil is in a suitable condition, and neither too wet nor too dry, watering will not be necessary for some time. Place the pots in a frame, and either shade the glass or place some fine leaf-soil over the top of the pots to keep the soil moderately moist. Remove the leaf-soil directly it is seen that growth has started. When the shoots are growing freely, they should have full exposure to the sunshine and an abundance of fresh air till cooler weather arrives, when the shelves of a moderately airy greenhouse will be a suitable place for them. At no time is it advisable to force *Freesias* into growth. When growth develops gradually, the stems are stiff and wiry, and the blooms last for a much longer time, both in a cut state and on the plant.

Cleansing plant-houses.—At the present time, many frames and glasshouses are empty; it is therefore a convenient time for performing any necessary repairs, for cleansing the glass, and for lime-washing the walls, &c.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE Bart., Burford, Surrey.

Odontoglossums.—At the warmer end of the cool house such plants as *Odontoglossum grande*, *O. Schlieperianum*, *O. Insleayi*, and its variety splendens are now sending up new growths, and when roots are seen pushing through the compost, afford more water to the plants, but avoid saturation of the compost as the stout fleshy roots are liable to turn black from excessive moisture. Periodically examine the young growths, and see that no water lodges in them, as they decay sometimes from this cause. The rare *O. Williamsianum*, a supposed natural hybrid, is now in flower. This plant, when growing, requires the same treatment as that afforded *O. grande*, &c.

Miltonia vexillaria.—Plants of this species that flowered early in the season should now be re-potted, but previous to commencing the operation it will be advisable to ascertain that the growths are perfectly free from small yellow thrips. These insects are often found concealed low down in the axils of the leaves where it is difficult to eradicate them with either a brush or a sponge without causing injury to the tender foliage. The most effectual method of destroying them is to dip or wash the growths in either XL All insecticide, or Nicotine soap, at the strength of 2 ozs. of the insecticide to 1 gallon of warm water. After dipping the plants into the liquid, place the pots on their sides, so that the insecticide may drain from the base of the plant to the tips of the leaves instead of percolating about the roots. When they have drained sufficiently rinse the growths with tepid soft water, and carefully shade the plants from direct sunshine for a few days.

Repotting.—Any plants that need repotting should be turned out of their pots, have all the old compost removed and any dead roots severed. It is advisable to look very carefully around, and under the base of each plant for woodlice, as numbers of these pests are often found concealed among the short roots. Many Orchid growers use rather large pots or pans for accommodating this *Miltonia*, but after considerable experience I find it an advantage to use receptacles that are small. The pots should be half filled with small crocks for drainage material, and a suitable compost is either one of good fibrous peat, or polypodium fibre, to which is added an equal quantity of chopped sphagnum-moss. When repotting have the base of the plant a trifle above the rim of the pot, and carefully press the compost down amongst the roots in a moderately firm, compact manner. Place the plants in the intermediate house, and in a position as near to the roof glass as is convenient, for exposure to much light and air is necessary to their well doing. For a few weeks after repotting the plants afford water very sparingly, but when new roots have been freely formed the amount of water afforded may be gradually increased in quantity. Unhealthy plants should be repotted into the smallest pots that will accommodate them, and they will be greatly benefited if dense shade is afforded them until growth is again active.

***Miltonia* × *Blueana*.**—The distinct hybrid *M. × Blueana* and its several varieties are now at their fullest development of growth. Afford them plenty of water at their roots, and give them a position in the Cattleya or intermediate house where plenty of air and light but not direct sunshine can reach them.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, BICTON, East Devon.

Apples of such varieties as Lord Suffield, Lord Grosvenor, Ecklinville Seedling, Duchess of Oldenburgh, and Keswick Codlin should be further thinned if necessary; the fruits so removed will be useful for tarts. American blight is making its appearance on some of the trees. This pest must be killed by methylated spirit or paraffin emulsion, applied by means of a brush, which should be worked well into the crevices of the bark during the operation. Fruits required for exhibition purposes must be encouraged to develop, and nourishment should be applied to the roots from now onwards, except in the case of any tree not carrying an average crop. As the smaller fruits, such as Strawberries, Currants, &c., become scarce, early-ripening varieties of Apples will be valuable.

Peach and Nectarine Trees have grown freely during the past few weeks and their shoots will require further tying. See that the fruits are not shaded by the foliage, for those that lack colour are usually deficient in flavour. Keep the rooting medium in a moistened condition now that the fruits are swelling, and afford manure to any trees that are considered to be in need of it. As soon as the early ripening varieties are harvested of their fruits remove any superfluous shoots, for this will assist in the proper ripening of the remaining current season's shoots, which will be the fruiting ones of next year. If a judicious disbudding of the young shoots was practised in the spring, very little pruning will now be required.

Late Strawberries.—Givon's Prolific is an excellent late fruiting variety of Strawberry, and it should be included in all collections. The fruits are large, highly coloured, and of excellent flavour. Sever all runners on the perpetual fruiting varieties before placing the net over the beds. Considering the untoward season, the Strawberry crop has been a large one.

Currants.—Red, White and Black Currants have all been abundant this season, and the two types first named will hang on the bushes for some considerable time yet if the birds can be kept away. Black Currants will all have been gathered by this date in the warmer counties, and it is good practice to do what pruning or thinning is necessary to the bushes now instead of deferring it until the winter, for it will enable the young shoots from the base to form a stout growth, and to fruit better next year.

General remarks.—Weeds must be destroyed by a free use of the hoe; it is many years since weeds gave so much trouble in the garden. Wasps

are much in evidence in these gardens, but their nests are destroyed by pouring cyanide of potassium into their burrows. This can be done at any time during the day, but the cyanide is a very strong poison and the greatest of care is required in its use. It must be kept from the reach of children. Another plan of destroying wasps is to pour ordinary gas-tar into their holes after it is dark, and to cover the hole with a big sod of turf; this plan, however, entails more labour. Protect early dessert Apples such as Mr. Gladstone, Beauty of Bath, Irish Peach, and Lady Sudeley, by nets, or the birds will destroy many. It may also be necessary to protect the fruits of Jargonelle Pears against birds.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq., Cobham Park, Surrey.

Onions.—The present is the most suitable time in most localities for sowing that portion of the Onion crop which will stand through the winter, but in very warm districts the operation may be deferred for a week longer. No benefit is likely to result from getting the plants too forward, as the more developed the plants become before winter, the less likely will they be to pass safely through hard weather. Giant Rocca, White Italian, Record and A1 are all excellent varieties that can be well recommended for sowing in August. If the ground is at all dry, apply a good watering in the drills before sowing the seeds, and if a little shade can be afforded from sunshine, until germination takes place, so much the better.

Salads.—A further sowing of Onion seeds for raising small plants to be used in salads may be made, also a sowing of the Black-seeded Cos and All-the-Year-Round Cabbage Lettuces.

Cabbages.—No time should be lost before making the main sowing of Cabbage, and Red Cabbage if they have not been made. Continue to make further plantings of Coleworts from previous sowings, by filling up any vacant and odd places, as these vegetables are always very useful.

Tomatoes, which last year were so successful all over the country, are this season a very indifferent crop. It is therefore the more necessary to give the plants timely attention in the way of removing all side shoots as soon as they appear, and in tying and watering, thus assisting them to develop their fruits as much as possible during the next month.

Peas are this season succeeding remarkably well up to this date. The maincrop, and plants raised from late sowings are in most seasons unsatisfactory, as they suffer from drought and excessive sunshine at the time the pods should be filling, but this season late plants are making satisfactory growth and are flowering, setting, and swelling up well. The latest plants which we have just staked are very promising; the heavy night dews which are now prevalent are helping them more than the overhead sprayings which have to be resorted to in very hot weather.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Park-fencing.—In the laying out of new parks and pleasure grounds, the provision and erection of boundary fences is not infrequently one of the most expensive matters to be considered. One of the most extravagant ways of enclosing such places is by a dwarf wall capped by an ornamental iron railing. This method of fencing does not appear to be so much in vogue now as it used to be, and should never be adopted unless under very exceptional circumstances, and in special positions. It often happens that those who are responsible for advising park authorities in such matters, favour the so-called unclimbable type of fence under the impression that this is the ideal kind for park purposes. These are usually from 6 feet 4 inches to 7 feet 6 inches high, and are composed of perpendicular iron bars with two or three horizontal bars to keep them in position, and they cost anything from 15s. to 30s. per yard run according to the size of iron and the work put into their construction. Those who have had any experience with such railings know what an extravagant form of fence this is, for it is neither ornamental nor is it unclimbable, and a much cheaper and cheaper form is quite as serviceable in keeping undesirable persons out of the grounds. For several years past we have not used iron fencing more than 4 feet 8 inches in height, and by the

judicious employment of barbed wire such a railing can be made quite as satisfactory as one 6 feet 4 inches high. It is found that the distance between the perpendicular bars is of more importance in keeping out trespassers than the height of the fence. If these bars are more than 5 inches from centre to centre small children are able by a little pressure to pass between ordinary $\frac{5}{8}$ -inch square or $\frac{3}{4}$ -inch round iron bars, and thus cause much injury to boundary shrubberies. Many large and important parks in this country have boundary fences composed of a wooden paling backed with plants of a strong-growing shrub, as a hedge. From the perishable nature of wood these require frequent repairs, and the expense involved in their maintenance becomes very high, so that, although the initial cost of an iron fence is great, in the long run the expense would probably be much less than the wooden one.

Minor fences.—Besides the boundaries a number of different places inside the parks require to be fenced off from the public—such as isolated shrubberies, slopes of banks, streams and ponds. In places of this description ordinary iron hurdles or dwarf hairpin fencing prove inexpensive and satisfactory. In the Glasgow parks a fence composed of wood and twisted wire about 3 feet to 4 feet high is used for these purposes, and, besides being cheap and easily fixed, its appearance is quite in keeping with the surroundings.

THE APIARY.

By CHLOEUS.

Marketing Honey.—Honey has too long been looked upon as a luxury of the privileged few, whereas it should be regarded as a necessary food in every household. To create a large demand for honey, and to cultivate the public taste for such an excellent food, should be the aim of the beekeeper. Many may ask how the apiarist can assist in either of these matters. He should place the honey on the market in a cleanly and attractive manner, and for this purpose he should use jars or tins, and the extracted honey should be strained so that no foreign matter may be found in it. The honey itself needs attention, and it should never be extracted from any but sealed combs, so that the aroma is retained and the presence of thin honey floating on the top avoided, for thin honey is little better than sweetened water. A beekeeper well known to the writer easily obtains from 9d. to 10d. per lb. for his produce, whilst his neighbours are glad of 4d. and 6d. for theirs, and at these low prices they have a difficulty in disposing of their honey. The causes are not far to seek. In the former case the honey can always be relied upon as being the best, the cleanest, and the most attractive on the market.

Low prices.—Many apiarists will now be harvesting honey and placing it on the market, which in consequence will be congested, and prices are certain to be low. Not only is British honey offered for sale, but it has to compete with a large quantity from foreign countries and the colonies. Very little of the imported honey, however, can compare with the home product. Most beekeepers in this country do not produce more than 300 to 400 lbs. in one season, and with a little trouble this may be disposed of to retail customers.

Grading Honey.—To many beekeepers "honey is honey" from whatever source. Those who meet with the best sales take care to keep their honey from distinct sources separate. To mix all the honey together regardless of the source from whence it was gathered is to lose the aroma and to seriously injure the quality. The section honey may be graded as first, second, and third, each grade commanding a separate price. The sections which are evenly filled and sealed only will be placed in the first grade. These, too, will travel best, and if any are to be sent away those filled out to the wood are the most suitable. The second quality should be good also, but they need not be so even nor so well sealed. The third division would be a little inferior in the same points, and those not fit to be included in this division should be returned to the hives or be put into the extractor.

Cleaning sections.—All sections must be well scraped to remove propolis and finger marks. This is tedious work, but clean sections make all the difference between selling for a bad and a good price.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 10—
Ann. meet. Roy. Botanic Soc., 1 p.m.

TUESDAY, AUGUST 13—Exmouth Fl. Sh. (2 days).

WEDNESDAY, AUGUST 14—
Taunton Deane Fl. Sh. (2 days).

SATURDAY, AUGUST 17—
Sheffield Fl. Sh.
German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—62.2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 7 (6 P.M.): Max. 68°; Min. 52°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 8 (10 A.M.): Bar. 30.6°. Temp., 65°; Weather—Overcast.

PROVINCES.—Wednesday, August 7 (6 P.M.): Max. 62°, Colchester; Min. 53°, North of Ireland.

Diversity in Foliage.

At the present season of the year when vegetation is most plentiful, and all the trees are in full leaf, the diversity of form to be seen in the leaves of plants can hardly escape the observation of anyone at all interested in nature.

In view of the identity of the principal vital function of leaves throughout the plant world, their numerous shapes are remarkable. Considered fundamentally, the leaf merely consists of a framework, designed to sustain and expose the vital cells containing chlorophyll to the action of light to the best advantage, and that function appears perfectly fulfilled by the simplest vegetable organisms consisting either of single cells or mere chains of cells, such as are to be seen in the Characeæ, the green, fibry growths which accumulate in stagnant water and which can hardly be termed foliage at all. The Lichens are a step higher, and in the lower realms of vegetative life are the Algæ inhabiting both salt and fresh water; the Marchantias, and so on, grading upwards to the Mosses and Ferns, and, through these, to the flowering plants, including all the diverse forms, from dwarf to giant, from the tiny Alpine plant to the great Sequoia. In the process of evolution, thousands of genera, many more thousands of species, and still more thousands of varieties have arisen, in every one of which are forms of leaves, of which no two are alike. Even among the myriad

leaves of a single tree, the Pines, perhaps, excepted, it would be difficult to find two leaves which appear exactly similar, even to the unaided vision. We can easily ascribe to evolution a difference in size, as we know that leaves subjected to shade and moist conditions respond to such by expansion, so as thereby to counterbalance the diffusion of light, while, on the contrary, foliage exposed to strong light and also to greater stress of wind is naturally dwarfed. This, however, does not account for their marvellous uniformity, grading from simple, undivided leaves to decomposite ones of infinitely fine cutting, or leaves of almost any imaginable outline, varied, moreover, by equally infinite variety of plan in the veins which form the supporting network of the cells.

Even when growing under apparently similar conditions, enormous differences in size are to be seen in leaves; thus, the tiny-leaved Box and the large-leaved Sycamore, and the Willow or Poplar associated with the Horse Chestnut are familiar examples of contrasting foliage growing side by side.

This variability, however, is mainly confined to one of the two great divisions of foliage-bearing plants, namely, the dicotyledons, or those which start life from the seed with two primary leaves and subsequently build up their stems by outside additions, forming in shrubs and trees the so-called annular rings with which we are familiar. In the other division, that of monocotyledons, the members of which start with a single primary leaf and to which the great family of Grasses belongs; also the Palms, Aloes, Yuccas, Lilies, and other bulbous plants, there is a general similarity of type in the shape of long, undivided leaves. If these are examined it will be found that a general characteristic is the system of parallel veins running from end to end, so that, while the leaves may be easily split longitudinally, it is a difficult matter to break them across. This system of venation does not lend itself to the formation of irregularly-shaped or divided foliage, nor to any marked variation of type, such as is common in dicotyledons. It is easy to see, for instance, that a leaf with a midrib from which springs a series of veins running to the margin, hering-bone fashion, may by simple extension of such veins become saw-toothed, deeply cut or even divided into secondary divisions, which appear impossible where all the veins run straight to the tip. The dicotyledons, having their veins arranged in an infinite variety of plans, have been able to respond to the influences of environment to a far greater degree. Cold and exposure, or great heat accompanied by drought, would naturally check the extension of the veins, and thus simplify the form of leaf, while conditions of an opposite character, as warmth, humidity, and shelter would stimulate the extension of the veins and, therefore, tend to bring about diversity of foliage.

Nature has endowed leaves with a capacity for serving other purposes than mere exposure of chlorophyll to light, an instance of which may be seen in the wonderful adaptation of the Droseras and Dionæas, and other genera, whose province it has become to obtain other food than that contained in the carbonic acid in the air, and whose leaves have been modified to serve this function.

OUR SUPPLEMENTARY ILLUSTRATION.—The four new varieties of Sweet Peas which form the subject of our Supplementary Illustration represent the latest additions to this popular flower. These, with three other varieties, were selected for awards at the annual show on July 16 last of the National Sweet Pea Society. All the flowers depicted in the illustration possess an undulate standard, though in the case of the variety St. George this is seen in a slight degree only, and it is the colour rather than the form of this flower which is its chief attraction. The colour is described by our artist as translucent scarlet, with wings shaded a crimson scarlet, and the keel of pale rose; the type of flower is known as orange, and it is certainly the best of this shade. All the remaining varieties shown have the waved standard and spreading wings of the Countess Spencer type, a bowl of which variety, with decorated grasses, is illustrated at fig. 43. The variety Evelyn Hemus is one of the best of the bicolor flowers. It has a cream-coloured ground, with a suffusion of rose which deepens at the margins into a distinct edge of this colour. Silas Cole is a very large flower with a broad, waved standard that is a deep reddish maroon shade. The wings are purple and of a somewhat deep tint, the keel is mauve with a white base. It will form a suitable companion to the well-known Black Knight. The variety Rosie Adams is a flower of large size and with a peculiar colouring, the central parts are violet or mauve, and this merges in the standard into a shade of rose. The names of the raisers were given in our issue for July 20, page 56.

THE BOTANICAL MAGAZINE.—The following plants are illustrated and described in the issue for August:—

ALOE NITENS, tab. 8147. This species was sent to Kew in 1877 by Sir HENRY BARKLY when Governor at the Cape. The specimen is cultivated in the Succulent House at Kew; it is 12 feet high and flowers in mid-winter. The species has green leaves crowded into an apical crown. The panicle bears about seven spikes, and the densely flowered spikes are described by Mr. C. H. WRIGHT as resembling those of Kniphofia aloides. The showy character of the flowers is due to the orange-and-red coloured stamens and anthers. In a brief note on the cultivation of Aloes, Mr. W. WATSON describes this species as one needing less heat than most others, and suggests that it would probably be an ideal plant for the gardens of the Riviera.

BRUCKENTHALIA SPICULIFOLIA, tab. 8148. This Ericaceous plant was discovered by SIBTHORP in Asia Minor more than a century ago. It was described as *E. spiculifolia* by SALISBURY in 1802, and as *Menziesia Bruckenthalii* by BAUMGARTEN in 1816. Dr. OTTO STAFF now describes the plant as having quite the appearance of a small Erica, but as differing from that genus in the campanulate calyx and the almost complete absence of a disc. It is pretty well-known as a cultivated plant in this country, growing about 6 inches high and having rosy-lilac coloured flowers. Mr. W. J. BEAN states that the species thrives well in the open air at Kew, planted in a light, peaty soil, where it forms close tufts about 6 inches high and a foot or more across. It commences to flower about mid-June, and remains in flower for about one month. Although quite hardy, the plant is too small to stand rough shrubby treatment. The best place for it is, perhaps, a shelf or miniature plateau on the rockery.

CALATHEA ANGUSTIFOLIA, tab. 8149. Mr. C. H. WRIGHT describes this species, which has been cultivated for many years, owing to its attractive foliage. Earlier names for the same plant are *Maranta discolor* and *Heliconia discolor*. It has narrowly, oblong acuminate leaves, 2 feet long and nearly 5 inches wide, pilose on both surfaces,

THE NYMPHAEA HOUSE AT SHIPLEY HALL, DERBY, WITH *N. STELLATA*
AND OTHER SPECIES IN FLOWER.

green above and purple beneath; the petiole is about 2 feet long, green, spotted with red, densely clothed with patent hairs, except for about an inch below the blade, where it is glabrous and swollen. The flower scape is 6-10 inches high, yellowish, spotted with red. The flowers are showy by reason of the pale yellow corollas. Mr. W. WATSON recommends the planting out of Calathea and Marantas rather than their cultivation in pots, and a selection of the two genera planted out in the Nepenthes House at Kew affords an instance of the success which attends such treatment. All the species enjoy a light, rich soil, plenty of moisture, shade, and a tropical temperature

is so decorative as the stemless species, and so far all attempts to cross them with plants of the latter type have proved unsuccessful.

DELPHINIUM MACROCENTRON, tab. 8151. Mr. W. BOTTING HEMSLEY describes this species, and the figure was prepared from a plant grown in the gardens of Mr. JAMES O'BRIEN at Harrow-on-the-Hill, Miss O'BRIEN having contributed a drawing illustrating the habit of the plant. The species was first discovered in Lykipia in the Masai country in 1884. The Hon. WALTER ROTHSCHILD imported seeds from Mount Elgon. The plant is a perennial herb, hairy in all its parts, and the stems, as grown in a pot, are about 5 feet high, slightly branched, having palmately divided leaves.

[Photograph by J. Gregory.]

FIG. 43.—SWEET PEA COUNTESS SPENCER ARRANGED IN A VASE WITH ORNAMENTAL GRASSES.
(For text see page 110.)

STREPTOCARPUS HOLSTII, tab. 8150. This is a caulescent species, raised at Kew from seed received from the Berlin Botanic Gardens in 1905. Two other caulescent species have been already figured in the *Botanical Magazine*, namely *S. Kirkii* (tab. 6782) and *S. caulescens* (tab. 6814). Mr. W. BOTTING HEMSLEY, who describes the present species, states that it is a much more ornamental plant than either of those named. It grows about 18 inches high, has fleshy, long-stalked, ovate, slightly hairy leaves. The cymes are produced in the axils of the upper leaves, and the flowers are of mauve-purple, with a white throat. Mr. W. WATSON states that none of these caulescent species

The flowers are hairy, blue and green or yellow, and green in some of the wild specimens, with a whitish apex, about 2 inches long. Mr. O'BRIEN is of the opinion that the species may prove to be hardy.

THE JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.—The thirty-second volume just issued contains a great amount of interesting matter. Exclusive of the *Proceedings*, which fill 240 pages, there are 350 pages of text. The more important "papers" and original contributions are as follow:—"A Japanese Garden in England," by Mr. JAMES HUDSON; "The

Formation and Care of Grass Lawns," by Mr. MARTIN H. F. SUTTON; "Garden Nomenclature," by Mr. G. W. BULMAN, M.A., B.Sc.; "Parasitic and Saprophytic Plants," also "Some Remarkable Adaptations of Plants to Insects," and "The Origin and Peculiarities of Climbing Plants," all by the Rev. Prof. GEO. HENSLAW, M.A.; "Animated Photographs of Plants," by Mrs. DUKINFELD H. SCOTT, F.L.S. (see *Gardeners' Chronicle*, April 28, 1906, fig. 110); "Phenology as an Aid to Horticulture," by Mr. EDWARD MAWLEY; "Some Phases of Twentieth-Century Horticulture in the United States," by Prof. CORBETT, of Washington; "Tea and the Tea Plant," by Sir GEORGE WATT; "Meteorology in its Relation to Horticulture," by Mr. R. H. CURTIS; "Researches at Wisley," by Mr. GEO. MASSEE; "Notes on Some Cornish Gardens and on Some Wild Plants Growing about Land's End," by Mr. A. WORSLEY; "An Annotated List of the Species of Campanula," by Colonel R. H. BEDDOME; "Horticultural Education," by Mr. F. J. BAKER; "The Education of the Cottage and Market-Gardener," by Mr. T. S. DYMOND; "The West Indian Lime," by ARCHIBALD J. BROOKS; "Mendel's Law of Heredity," by Mr. C. C. HURST; "A Criticism of the Exhibition of South African Fruit Exhibition," by the Rev. W. WILKS; "Perfumes: Their Source and Extraction," by Mr. JNO. C. UMNEY; and "The Value of Fruit as Food," by Dr. JOSIAH OLDFIELD. Some of the papers, Mr. HUDSON's, for instance, were delivered more than two years ago, and the volume does not include any paper which has been read at meetings held during the present year. There are many useful reviews of new books, and the "Commonplace Notes" are interesting, as usual. The "Notes and Abstracts" occupy about 30 pages, but they have been obtained from fewer periodicals than usual. In addition to the subjects already mentioned, there are reports of the trials at Wisley and much further information of a miscellaneous character. The work of editing such a voluminous publication must entail a great amount of work, and Mr. SAUNDERS is entitled to congratulation for the excellent manner with which it is discharged.

THE COURSE OF FLOWERING IN ACER PLATANOIDES.—Some remarks are published in the *Botanischer Centralblatt*, No. 27, 1907, concerning observations made on the flowering of *Acer platanoides* in the town park at St. Gall (660 metres above sea level), by the Hon. P. VOGLER. It is there stated that every tree of this species had at first a 10 to 20 days' period when male blooms only were developed, followed at an interval ranging from one to five days by a development of female flowers, so that, as a rule, wholesale pollination appeared to be excluded. A second crop of male blooms appear in most instances.

FIBRE FROM PINEAPPLE LEAVES.—*The Florists' Exchange* contains a note by Vice-Consul J. K. FOSTER, on experiments recently made in Queensland to obtain useful fibre from the leaves of the Pineapple plant. This fibre is situated in the jelly-like tissue beneath the tough epidermis. The latter becomes removable by maceration in water. Hitherto the leaves have been thrown away, but should the fibre prove useful, and the process of extraction not too costly, the Pineapple cultivator will secure a valuable by-product.

A CHEAP BOOK ON THE CULTIVATION OF BULBS.—A handbook on the culture of the commoner bulbs has been published by the AGRICULTURAL AND HORTICULTURAL ASSOCIATION at the price of one penny. When we say that the author is Mr. S. ARNOTT, who frequently contributes to our own columns, and that the handbook contains numerous illustrations, it will be at once evident that the purchaser will be sure to obtain good value for his penny.

LILIUM TESTACEUM AND L. CANDIDUM HYBRIDS.—The following notes on this subject are from Herr F. SCHENBEL, of Oberlahustein, Germany, and were kindly sent us by Mr. GUMBLETON:—"Of the seedlings raised from crosses made between these two species, seven have flowered and, of these, six have bloomed for the first time. They commenced to flower earlier in the season than either parent. The one which flowered for the second time was as vigorous as *L. testaceum*, and reached a height of 5 feet; it bore six flowers as large as those of *L. testaceum* and of like form, but of a coral-red shade of colour. Of the remaining six three were of the same height as the first had been last summer, or between 3 and 4 feet, and bore two or three flowers each. In the case of two of them the colour of the flower was like that of *L. chalcedonicum*, but in size the blooms were as large as those of *L. testaceum*. The third had a large orange-coloured flower. The three other seedlings were of more slender growth, bearing only one flower each. In the case of two of them the colour of the flower was a shade redder than that of *L. testaceum* at their opening, but their interiors turned darker and darker every day until they were mid-way in colour between *L. chalcedonicum* and *L. testaceum*; the backs of the petals remained light and contrasted well with the interiors. The last of the seven seedlings was the most slender of them all, with a small flower much lighter than the female parent. I think that these hybrids prove two things—first, that hybrids often revert to one of their grandparents, showing little more than a trace of their immediate parents; and, secondly, that *L. testaceum* is a hybrid probably between *L. chalcedonicum* and some other nearly allied species."

LILIUM TIGRINUM.—Kew received in January of this year, writes W. W. in the *Kew Bulletin*, some bulbs of a *Lilium* from Messrs. WATSON & SCULL, 90, Lower Thames Street, E.C., who stated that they had been sent by a nurseryman in Shanghai, with the information that they were of an unknown Lily from the interior of China, where they were cultivated for some medicinal property contained in the bulbs, and that they had stems 4 to 6 feet high, and flowers "white with a little yellow." The bulbs, on comparison with cultivated examples of species of *Lilium*, were most like those of *L. auratum*, and the description of the flowers also pointed to that species, which, however, is known only from Japan, although it has been suggested that it may be of Chinese origin. Bulbs of an "unknown Lily from China, with white and yellow flowers" were soon afterwards offered for sale by English and other dealers, and a dozen were purchased for Kew. Some of the plants, from both sources, are now in flower, and they prove to be nothing more than *L. tigrinum*, Ker-Gawl., one of the most widely-cultivated of Chinese *Liliums*, which was first introduced into England in 1804, where it is now in almost every garden, and is represented by several well-marked varieties, including one with double flowers. It has been collected wild in Pekin (DAVID); Hupeh; Ichang and Patung (HENRY); Szechuen; Tchen-keoutin (FARGES); Corea (PERRY); Chemulpo (CARLES); the Korean Archipelago (OLDHAM). It is also wild in Japan. Dr. HENRY states that in Ichang this species is cultivated and the bulbs eaten, and that dry Lily flowers are used by the Chinese for flavouring soups and as a remedy for pulmonary diseases (see also *Kew Bulletin*, 1889, p. 116). It is therefore not impossible that the particular form of *L. tigrinum* now in question, with bulbs unlike those of the forms usually known in gardens, may be one of those cultivated in China as a vegetable.

DAHLIAS.—The following remarks on Dahlias in England are taken from a paper by Mr. G. H. HOWARTH, which is printed in the *Dahlia News* (American) for July:—"Perhaps no one flower has so many varieties as the Dahlia—the Cactus for instance was first exhibited in England in 1880—just 27 years ago, and now there are thousands of good Cactus Dahlias, hundreds of which have received first-class certificates, awards of merit, &c., for in England the Dahlia is of no use commercially until it has been properly judged and stamped with the approval of competent judges, a truly commendable way of setting a value on new varieties. Many varieties which in England and Germany may be all that is claimed for them, are a great disappointment here under the most favourable conditions—taking for instance 'Winsome,' supposed to be an ideal white, perfect shape, &c., as far as this variety has been exhibited in this country, it is very ordinary indeed, as is also Lord Roberts and Keynes White. Strange as it may seem, England has not produced a pure white Dahlia, all her so-called whites being of a cream tint, while France has sent over even in 1900 a good white Decorative Dahlia which was classed as Cactus at that time, 'Mme. Armond Charet.' England, France and Germany vie with one another each year in producing new or improving on old varieties in the Cactus shape, as well as improving the formation of the flower, and it is to those countries we owe to some extent the interest which is kept up by their introduction. It is to be hoped in the coming years that America, instead of following, will be leading, and this result can only be obtained after weeding out the worthless kinds and growing only the best; encouraging the growth of 'seedlings' and having a competent committee of sufficient jurisdiction to judge their merits, and if found worthy, award them distinctions."

THE SEED CROPS IN FRANCE.—According to a report in the *Bulletin des Cultivateurs de Graines*, the trade in the last season was satisfactory, and the warehouses having been nearly cleared of old seeds, especially of Cabbage seed, higher prices are hoped for. A good harvest is anticipated, more especially in the south, where the climatical conditions have been favourable. In the north and central departments more rain fell than was good for seeds, but improvement followed at the end of the rainy period. The sowings for 1908 have, in general, been satisfactory, and the weather favourable to growth. The harvest for the present year, so far as an opinion may now be formed for the various crops, will be as follows. Seed of Mangold Wurzel will fetch medium prices. The crops in the neighbourhood of Paris are as yet in good condition. Beets in the central districts of France have developed vigorously; but in the south growth is slow and aphides have already made their appearance. Seeds of table Carrots and cattle-feeding Carrots should fetch good prices. With the exception of certain crops in Central France, where the rainfall worked mischief, the condition of the seed crops leaves nothing to be desired. Cabbages promise well. The crops of Hearting Cabbage seed in the vicinity of Paris and in Central France are somewhat deficient; but in the south, on the contrary, the harvest will be excellent. The crop of Brussels Sprouts is safe, and that of Cauliflower in Italy will be excellent. Kohlrabi is everywhere good. Cucumber and Gherkin seed came up badly in the north and centre owing to wet, cool weather at the period of seed-sowing. In the south the plants suffered much less. Beans germinated badly, and the quantity sown in the south was inconsiderable. Cabbage Lettuce and summer and winter Endive are expected to yield normal crops.

Onions promise a good crop, but the promise may be spoilt at the last moment. Of the chief variety, "Vertus," several cultures in Central France are diseased, whilst about Paris and in the south the condition of the plants is extraordinarily fine. Leeks are excellent, but land occupied by this crop is limited in extent; the demand will about be covered, and medium prices obtained. Parsley showed well for seed, and a good harvest is expected. Peas will be plentiful, and as the demand is constantly increasing, dealers are expecting to get good prices. The harvest commenced early in July. Salsafy and Scorzonera promise good crops in France and Holland, but the amount of land under these crops is not great.

THE ONION CROP IN EGYPT.—The fear that high prices would prevail this season has been justified. In consequence of the low temperature the quality of the bulbs is inferior; at the beginning of the Onion harvest but small quantities came to hand, and the harvest was believed to be an inconsiderable one. The American demand also had an effect on prices. At the beginning of the month of May there were heavy shipments to England, but owing to the large quantities brought to market, prices declined. In that month the price per sack of 50 kilog., free on board, at Alexandria, was 4s. instead of 2s. 4d. as in the previous year. Up to the end of April there were shipped 680,904, against 1,037,495 sacks in 1906, of which 32,371 went to Hamburg; to English ports, 500,484; to Trieste, 110,915; Rotterdam, 21,396; and Marseilles, 12,000 sacks.

TIMBER FOR CLOG SOLES.—In several parts of Shropshire, Hampshire, and throughout Wales, the northern counties in particular, the making of clog soles is an important and remunerative industry. The wood of Alder is preferred for this work, but Birch, Willow, and Sycamore are occasionally used, and in many woodlands of these districts traces of the clog-maker may be found in the heaps of chips or shavings which are cut off in forming the soles. It is interesting to watch the speed with which the sole for a clog is shaped out of the prepared block of wood, and with the most primitive and modest appliances—a roughly-formed stool, to which a portion of an old scythe blade hinged at one end, and with a wooden handle at the other, is attached. In the way of dexterous handicraft no more interesting sight can be afforded than to watch a skilful maker of clog soles. The ready certainty with which the woodman, when taking one of the prepared logs in hand, sees how it can best be treated, and the readiness with which the rude tools are made to bring about the desired result, are admirable, and a forcible example of skilled labour. Young and quickly-grown trees, with stems from 9 to 12 inches in diameter and as clean as possible, are most sought after, and the price varies with the locality from 8d. to 10d. per cubic foot. Generally permission is given for the work to be carried out in the woodland where the trees are felled, and the cost of haulage and carriage is thereby saved.

ROOT ACTION AND BACTERIA.—Mr. F. FLETCHER, writing from Poona in a recent issue of *Nature* in respect to a previous note by Mr. SPENCER PICKERING on "Root Action and Bacteria," states that experiments he has made at Poona both in the field and in water culture with a large number of varieties of plants do not lead directly to the conclusion that the proper functioning of roots depends on the presence of bacteria. Water cultures have been made on a fairly large scale, three harvests of 90 plants being taken in a large number of dishes, each containing two litres of water. After the third

harvest, the water was allowed to stand and evaporate to half its volume. On attempting to use this water for further water cultures, all the plants sown in it died within two days and some within half an hour, the time varying with the variety of plant that was transplanted into the water, and with the variety that had previously been grown in the water. Further, boiling this water, writes Mr. FLETCHER, neither increases nor diminishes its toxicity to plants. It is, moreover, immaterial whether the nutrient solution is such as to become acid or alkaline after use; neutralisation in either case does not make it possible to grow plants in it. His experiments lead to the conclusion that the roots of all the plants so far tried excrete a substance that is toxic to all plants (including that by which it is excreted), but in different degrees. Similarly, in the field *Sesamum indicum* will not grow (on stiff black soil) within 2 feet of *Sorghum vulgare*; all the plants tried to appear to decrease the yield of neighbouring plants of the same variety by about 50 per cent. The effect of the toxic substance both in the field and in water culture is completely neutralised by tannic and pyrogallic acids, carbon black, and other substances. It is, of course, possible that bacteria in the soil have a beneficial action by elaborating antitoxins similar to those mentioned. Mr. FLETCHER states that he has not yet been able to isolate the toxic substance contained in the polluted water of his cultures.

ARGEMONE GRANDIFLORA.

ACCORDING to Mr. Archer-Hind who thinks very highly of this plant, it was known to Dioscorides more than 1,800 years ago, and, in Nicholson's *Dictionary of Gardening*, its date of introduction into this country is given as 1827. Notwithstanding the many years that have elapsed since it was first brought into England, the species is not common in gardens, which is the more surprising when its beauty is considered. The flowers, which are 4 inches across, are of a satin-like texture; they are pure white, with a central bunch of yellow stamens. Except in size, they are very similar to the blossoms of *Romneya Coulteri*, but the latter are often 7 inches in diameter. A bush, such as that illustrated at fig. 44, 4 feet in height and as much through, is an exceedingly pretty sight when in full flower, as many as 40 expanded blossoms being sometimes carried simultaneously. The plants usually begin to flower at about the end of June, and remain in bloom for about four months. The individual blossoms last little longer than a day, but are produced in such profusion that their fading is unnoticed. The leaves are grey and very prickly, and are from 6 inches to 9 inches in length. Seeds are borne freely in pods liberally armed with prickles, and seedlings may, therefore, be easily raised. The species is generally considered to be an annual, but in certain cases the plants throw up again from the roots. The plant illustrated was put out four years ago, and every season has renewed itself by growths put forth from the base. This was also the case with an extremely fine specimen in Mr. Archer-Hind's garden a few years ago, which was 5 feet in height and 15 feet in circumference. On one day this plant bore 50 expanded blossoms. Where it is treated as an annual, it is best raised in heat at the beginning of March, and planted out, when large enough, in the month of May. It much resents transplantation, and great care should be taken in planting it out, since the least twist given to the seedling may prove fatal. The plants succeed best in light soil, and the species being a native of Mexico, it likes a warm position. Most probably the fact that the soil, in which the plant illustrated is growing, is very light and its position warm, has much to do with its proving perennial. *S. W. Fitzherbert, Devonshire.*

HEMSTED PARK, KENT.

HEMSTED Park, the seat of Earl Cranbrook, is situated in the parish of Benenden, some four miles from the ancient market town of Cranbrook, in the heart of the Weald of Kent. The present peer is the second holder of the title; the first, perhaps better known as Mr. Gathorne-Hardy, was one of the brilliant coterie of statesmen who formed a distinguishing feature of the mid-Victorian age. The estate is charmingly placed on high ground, and the natural conformation of its entire area, with a soil varying from peat to a stiff sandy loam, lends itself to every variety of gardening. Park and lake, woodland and pleasure gardens are features of great interest, yet the wild garden, dells and pools would appeal to many as possessing a greater charm and beauty than the gayer flower-gardens, borders and walks.

The park, which is some 300 acres in area, is entered through iron gates, which are flanked

Azaleas are a feature of the estate, the former especially, and the varieties embrace many of the best in cultivation.

In the wild garden, near the mansion, is the largest lake, and it would be difficult to imagine a more reposeful and pleasing prospect than this affords. On the perfect July afternoon that I saw it not a ripple moved the surface of the water, nor the slightest breeze stirred the leaves of the Weeping Willows, Poplars, Limes, Rhododendrons, and Alders that fringed the banks.

During nearly the whole year the ground is covered by breadths of floral subjects. Snowdrops and Crocuses in the early spring are quickly succeeded by Daffodils of many varieties, and Primroses (this part of Kent is famous for these flowers), Bluebells and Tulips later; while during the summer Foxgloves, *Lilium Martagon*, Honeysuckle, and many other flowers flourish luxuriantly: in marshy spots *Primula japonica* abounds.

In the rock garden hardy Ferns propagate freely, and plants are found in every crevice of

FIG. 44.—ARGEMONE GRANDIFLORA: FLOWERS WHITE, WITH YELLOW STAMENS.

on the left by a picturesque lodge. The greensward on either side of the carriage drive is broken by trees placed in some cases singly, at others in groups, in effective situations, thereby enhancing the natural attractiveness of the landscape.

To a lover of trees, Hemsted would afford endless delight. Most indigenous species flourish, and many of the individual Oak, Beech, Elm, and Ash trees may be regarded as specimens. There is a fine avenue of Limes, also one of old Elms. Owing, however, to the evil reputation the latter species has of dropping its limbs suddenly, the Elms are to be replaced by Yews. Conifers also do well in various situations. There is a specimen of the beautiful *Sciadopitys verticillata* which is 25 feet in height. At the time of my visit the *Liriodendron tulipifera* was in full flower, and the *Eucalyptus* exhaled its pungent fragrance in the summer air. Rhododendrons and hardy

brick or stone where a spore can obtain a lodgment. Among many others, I noticed *Scolopendrum vulgare*, *S. vulgare marginatum*, *S. cristatum*, *S. ramomarginatum*, *Asplenium filix-fœmina* (vars.), *A. lanceolatum*, *A. l. crispatum*, *Polystichum aculeatum*, *Lastræa cristata* and *L. aculeata*.

Before concluding a description of this part of the grounds attention must be drawn to the meres, in which the Water Lilies are grown, and it would be difficult to find any spot more pleasing both by its natural conformation and its charming environment. There are two ponds situated at different elevations, while in these choice *Nymphæas* of the *Marliacea* type and *Arum Lilies*, &c., were at the time of my visit flowering in perfection, while in the marshy ground breadths of Forget-me-Nots, *Primula japonica*, *Mimulus*, *Iris*, hardy species of *Cypripedium*, *Digitalis*, and other bog-loving subjects were flourishing. Clumps of *Bambusa* and *Gun-*

neras evidently find in this spot congenial conditions. Many of the common English Ferns are seen, and a lover of Mosses could quickly cull an interesting collection from this spot.

Cultivation under glass is carried on in thirteen houses, which are suitably contrived for the various purposes they are put to. Tomatos showed good culture, and were furnishing heavy crops of fruits. Cucumbers of the variety Telegraph also made a fine show. The principal varieties of Grapes grown are Lady Downe's Seedling, Muscat of Alexandria, Madresfield Court, and Black Hamburg. Of Melons, Hero of Lockinge was doing well, the fruits being of large size.

In the stove-house was seen a small collection of healthy-looking Orchids, principally Cypripediums, also Begonias, Eucharis, Pancratiums, Clerodendrons, Allamandas, Dracænas, Gloxinias, and many exotic subjects.

In the fruit and vegetable departments the crops were developing well. Currants, Gooseberries, and Raspberries were all fruiting freely. In this quarter of the garden hardy perennials are planted for furnishing flowers for decorative purposes; there are also splendid rows of Sweet Peas. I noticed a collection of the best varieties of Chrysanthemums which promised well for the autumn and winter. Apples and Pears are grown in bush, espalier and standard forms, but some of the trees are aged, and the gardener hopes to replant them in the near future with newer varieties. Fruit is grown under considerable difficulty at Hemsted. The grounds are a veritable sanctuary for birds of all kinds. The owner delights in bird-life, and the rarer species are encouraged. Many varieties are, however, very destructive to fruit in the various stages of its development; consequently, owing to the number of birds, a continual struggle is being waged, and every means—save that of destruction—has to be employed to save the fruit-crop from the ravages of the pets. In the wall-trees, Plums, Peaches, and Pears were producing fruit fairly abundantly.

The mansion is an imposing structure of red brick, with stone facings and embellishments, built some sixty years ago. It occupies high ground, and forms a prominent landmark. The style of architecture is generally what is known as Elizabethan, though there are modifications, and a magnificent tower rises from the centre. The natural slope on which the house stands is formed into terraces. Stone steps lead from the highest to the lowest of these. Pediments with statuary and vases are at either side of the commencement of each flight of steps, while a handsome balustrade separates the gardens from the park. Formal gardening (with but one exception) is now entirely discarded. On the walls of the mansion are Honeysuckle, Ivies, Magnolias, whilst at the base of the walls *Carpentaria californica*, *Choisya ternata*, and *Camellias* thrive without any protection.

An interesting feature are the trees planted at different periods by members of our own Royal House, also by foreign potentates, eminent churchmen and statesmen. I noticed, too, a pergola, clothed by a number of varieties of rambling Roses.

On either side of the highest terrace there is a slight declivity, at the bottom of which the surface of the ground is flat. These spaces were formerly utilised for carpet and other formal bedding. In the centre of this space to the right is a handsome vase containing suitable tall-flowering subjects, while around the vase was a good selection of Begonias. At some distance from this bed the lawn is uncovered, forming a band which, with graceful meanderings, completes a circle. Here are planted a great number of choice Roses grown in bush form, such as the varieties Madame Cochet, Frau Karl Druschki, Papa Gontier, Dean Hole, Marie van Houtte, The Bride, Caroline Testout, Duke of Edinburgh, Ulrich Brunner, and many others. The beauty of this spot is completed by a bed of *Kalmia latifolia*, and a group of trees embracing

Cedars, *Cryptomerias*, Acers, Sequoias, and Evergreen Oaks. On the opposite side of the terrace a space is laid out geometrically, the lines being indicated by Box. With a little adaptation this could be formed into an ideal old Dutch garden.

In the herbaceous border a good selection of Phloxes, Helianthus, Asters, Lupines, Galegas, Rudbeckias, Poppies, Spiræas, Hemerocallis, and Lilioms were flowering. I observed, too, some interesting shrubs, including Weigelas, Berberis, *Andromeda japonica*, *Styrax japonica*, &c.

The conservatory is a structure measuring 19 yards by 18 yards. At the time of my visit it was gay with Coleus, Fuschias, Pelargoniums, Heliotropes, Hydrangeas, Palms, Ferns, Carnations, Phormiums, Camellias, and Habrothamnus, while the roof was in part adorned with the magnificent climber *Bougainvillea glabra*.

As one steps from the greenhouse on to the terrace a magnificent prospect opens to the view. The sight wanders from the park to the highly cultivated countryside beyond—Hop gardens, Wheat fields and grassland. Comfortable farm-houses nestle in the sheltering hollows, while shaws may here be seen climbing halfway up the hills, then tracts of country covered by timber, the remains of the primæval forest that once possessed the whole of the Weald. Villages with battlemented church towers allure the eyes—a panorama of English comfort, English culture, English beauty. At length the objects become more and more indistinct, until the horizon is bounded by the far-away South Downs, through a gap of which, on favourable occasions, a glimpse may be obtained of the sparkling waters of the distant English Channel. The gardens are in the charge of Mr. Adams. He has been in the employment of Earl Cranbrook for a short period, but he must be congratulated upon what he has already achieved. *Richard T. Hesketh.*

FRUIT REGISTER.

SOME GOOD STRAWBERRIES IN 1907.

I HAVE recently been able to note the value of a few varieties of Strawberries. From the private gardener's point of view, mere size is not so important as good flavour. Several new varieties have been sent out this season, notably Laxton's Progress and Reliance. These I have not grown. "Cropper" is well named; I saw it bearing an enormous crop, and the fruits were excellent. The first of what I call the good Strawberries on my list is "Reward," which has done well for three seasons. The immediate parents of this excellent Strawberry were British Queen and Royal Sovereign, and this latter variety appears to have united a vigorous habit and good cropping qualities with the excellent flavour of British Queen, with the result that Reward will thrive in soil that is not at all favourable to the British Queen. I do not go so far as to say Reward is equal to British Queen, but it should prove as popular as the well-known Royal Sovereign on account of its robust growth, excellent flavour, and good cropping qualities. I should class it as a maincrop or mid-season fruit, and the variety has this peculiarity—it perfects a larger number of larger fruits at one time than most varieties do. It is seldom injured by spring frosts, which often cause injury to Royal Sovereign, owing to its early flowering.

Another very fine fruit that is well worth a trial is "The Bedford," a cross between the varieties Dr. Hogg and the older Sir Charles Napier, and, though it may not be considered equal by some growers to Reward, I place it in the front rank for its good cropping qualities, rich flavour, and colour. As a garden variety it is most valuable for its free growth in poor land.

My last variety is Givon's Late Prolific, and this is certainly one of our very best late Strawberries. I planted this variety largely for some

years, discarding others, and we never had cause to regret having done so, for it is far superior to others for late-cropping. This variety, if grown on a north border, continues the supply of Strawberries well into August, especially if young stock is grown yearly for that purpose, and, in addition to its lateness, it is of excellent quality and crops well. The variety has been for some years in cultivation, but even now it is not known as much as its merits deserve. There are other varieties worth mention, but my object is to name only the best after a thorough trial and those that succeed well with ordinary culture. At the same time, it is advisable to make the soil as good as possible by the addition of suitable material. *G. Wythes.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

PHOTINIA SERRULATA.—In the issue for March 30, Mr. W. A. Cook, writing from Leonardslee Gardens, Horsham, mentions a specimen of this *Photinia* 22 feet in height and 23 feet in diameter, which he states is supposed to be the finest in the country. In this he is mistaken, for in the *Gardeners' Chronicle* of March 17, 1906, p. 173, particulars were given of an example growing at Pengreep, Cornwall, which is 35 feet in height and as much through. At Enys, near Penryn, there is a splendid specimen 35 feet in height and 34 feet in diameter, so that Mr. Cook's tree is beaten by 12 feet by these two Cornish examples. These enormous plants are very ornamental in the early spring when bearing their large corymbs of pure white blossoms, with which the crimson tint of the young foliage makes a charming contrast. *S. W. Fitzherbert.*

CULINARY PEA LAXTONIAN.—This new variety yields pods containing seven to nine Peas, of a dark green colour, and the pods are long enough for staging at the best exhibitions. The plants grow from 1 to 1½ feet in height, and the crop is very quick in coming into use. From seeds sown on March 9 on a south border, the plants produced Peas ready for use on July 3. The variety Thos. Laxton (which is one of the quickest Peas to mature) was sown on February 27, and the crop was ready on July 1, which is 124 days, against 116 days for Laxtonian. In flavour Laxtonian appears to be best of all. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

PLAGIANTHUS LYALLII.—As doubt exists as to this plant being hardy in this country, it may be interesting to know that a specimen planted in the open gardens at Basing Park five years since, in well-prepared ground on heavy clay, has withstood the winters unprotected save the first one after it was planted. The plant was about 18 inches in height and was planted from a 7-inch pot. It is now a good shaped bush, measuring 10 feet in height, and 8 feet 6 inches through. The seasons in our district are cold and late, and the gardens are situated between 600 and 700 feet above the sea level. *T. Down, Basing Park Gardens, Alton.*

FLORA OF PALESTINE.—I cannot accept Sir W. T. Thiselton-Dyer's interpretation of the Hebrew word translated "Lign-Aloes" in Numbers 24, 6. The tree Lign-Aloes or Eagle-wood is the wood of *Aloexylon Agallochum* of Cochin China, which yields strong perfume, much prized by Orientals. Balaam is not likely to have known this plant, though several false kinds are spoken of by the ancients. But, in interpreting the Hebrew word, it is not a question altogether of "philological evidence." Besides the consonants being the same as those for "tents"—there being no vowel-points in the original texts—the LXX translated the sentence, "As Lign-Aloes which the Lord hath planted" (R.V.), by, "tents which the Lord has pitched," using the same Greek word as in verse 5. The LXX has *aloth* once, but omits all mention of aloes elsewhere. Moreover, the Greek word *aloe* was never used for "lign-aloe." Again, the writer of the Epistle to the Hebrews, seemingly referring to this passage, speaks of "the true tabernacle which the Lord pitched" (Hebrew 8, 2). Lastly, Coverdale has—"as ye tentes which the Lorde hath planted."

The true Aloe is associated with Myrrh, Cassia or Cinnamon, because it was used to "fix" the more delicate perfume, but has none of its own. The Aquilaria-wood was first called Xyl-aloe (or Lignum-Aloe, i.e. "Lign-Aloe"), by Aëtius, a physician of the fifth century; because the wood was bitter like the resin of Aloe. As the interpretation must solely rest on probabilities, they seem to be in favour of "tents" rather than "Lign-Aloe." *Your Reviewer.*

WOOD-WOOL FOR THE SUMMER MULCHING OF STRAWBERRY BEDS.—Owners of small gardens often have difficulty in getting suitable material for the mulching of Strawberry beds. In such cases I would recommend them to use some of the coarser types of wood-wool now in such general use for packing purposes. A stone of it will go a long way if carefully put under the flower trusses in good time, and will answer the purpose of keeping the fruit clean. Most seedsmen keep it in stock, and no doubt if the demand were to increase it would be met by the merchants having smaller lots put up in readiness for quick delivery. At present it is only obtainable in a compressed form in large bales. I have an idea that slugs do not like travelling over the surface of this material, but as my experience of its use is only recent, I do not like to say too much as to its general merits. *H. J. C., Ulleskelf, York.*

GENISTA MONOSPERMA.—A note on this plant appeared in the *Gardeners' Chronicle* about three years ago, the writer of which stated that it was not likely to survive out-of-doors anywhere in England, except, possibly, in the extreme south-west. He suggested that, although under the burning sun of Morocco, or Palestine, or Spain, it was very beautiful when in flower, there was little hope of its blooming, even if it remained alive, in this country. About three years ago I received a plant under the name of *Retama monosperma*. I am unable to find this generic name in any horticultural dictionary, but the plant appears identical with specimens of *Genista monosperma* that I have seen, so I conclude that my plant is this *Genista*. The specimen has grown well and is now over 5 feet in height. This spring the thin flexible branches became studded with buds, the first flowers on one spray opening in May last. The plant bore several hundred buds, and when these were fully open it was a pretty sight. I have met with it in a few gardens, but have never before seen it in flower. In its native country it is said to inhabit dry, hot regions, the conditions of which would certainly be very different to those common in south Devon. The unusual and lengthened drought of last summer may, however, have been the predisposing cause which induced flowering. *S. W. Fitzherbert, South Devon.* [The genus *Retama* is now sunk under *Genista*, see *Index Kewensis*.—Ed.]

A VETERAN GARDENER.—I shall be glad if you will add to your interesting paragraph about Mr. Anderson in the issue for August 3:—"That during the 44 years of service as head gardener at Sewerby House, he has won and preserved the thorough confidence and affectionate regard of two generations of employers." *Y. G. Lloyd-Greame.*

THE GARDENING CHARITIES.—You comment in your issue of the 3rd inst. on Mr. Crisp's public-spirited action in forwarding to various gardening charities the fees received for showing his beautiful gardens, and you invite other garden-owners to imitate his excellent example. Why won't they? Some years ago you were good enough to publish a letter in which I urged this very course, but nothing has come of it, and probably never will, unless somebody will take the lead. I think it is the managers of the particular charities who ought to bestir themselves and bring the matter to a practical issue by inviting owners of interesting gardens and houses to add their names to a list of owners willing to follow Mr. Crisp's example. This list should be published from time to time, and I feel convinced it would not only rapidly find adherents, but the holiday of many a lover of gardens and architecture would be enriched thereby, as well as the exchequer of the gardening charities. Many people shrink from taking the liberty of asking admission to private gardens, who would nevertheless gladly go if, by paying half-a-crown, they could put their visit on a business footing. *L. Messel, Nymans, Handcross, Sussex.*

GARDENING BY SCHOOL CHILDREN.—The prominence now being given to children's exhibits at flower shows throughout the country shows an awakening to the fact that if future generations are to make gardening either a means to a livelihood or a recreation, the work of preparing for such results should commence early in life. Very common at most rural or provincial flower shows have been baskets or bunches of wild flowers, and occasionally, although none too frequently, some charming combinations have been seen, the product of children's efforts. At the Cardiff show recently some 150 baskets, and an equal number of bunches, or nosegays of wild flowers were staged by school children, and they made a very attractive feature. But beyond showing taste or skill in arrangements—and such skill and taste is specially worthy of encouragement—there was nothing at all educational about the display, and probably hardly one competitor in 50 knew even the common or local names of the wild flowers they had so abundantly collected. Much greater value would attach to classes for small bunches of wild flowers set up in distinct species or varieties in small bottles or jars, each flower being, so far as possible, correctly named. The instruction of the children in correct naming should be the duty of the school teachers, but the collecting and setting up should be the work of the children. Two classes, one for 12 kinds and one for 24 kinds, might well be included. It should be clearly understood that unless these wild flower displays are made educational they serve no useful purpose. At Cardiff there was a class for collections of wild grasses, which it was required should be named. Out of the several exhibits only one collection was either properly arranged or named. Still, that one served to show children what was really required of them, as, apart from each bunch being fixed on to a card neatly and conspicuously, the popular name was attached to it. If in future years it be made an absolute condition that all collections of these grasses shall be similarly shown and named, and that all others not so staged and named shall be rejected, also that collections of wild flowers be shown in bunches and named, then really good educational work will be done. But this is not gardening after all, any more than is 'nature study, as taught in schools, although it is made wonderfully instrumental in instilling into the minds of children a love for vegetable life in its varied aspects, such as can hardly fail to show its good effects in mature years. Drawings of plants, leaves and flowers, the watching and testing the growth of seeds, the unfolding of flowers and instruction in the organs of plants must materially help children to become, if not gardeners, at least lovers of nature. The great aim of the nature study teacher, however, should be to check in the children destructive tendencies, whether of vegetable or of animal life, and to lead them to understand that, as they are themselves but parts of a great whole, so should they learn to respect and sustain every other part, so far as in them lies. When wholesale destruction of animal or bird life forms the dominating sport of rich people, children can hardly be expected to understand why they may not ruthlessly uproot a plant, destroy a flower, crush a worm, or rob a nest of its eggs. After all, the best real work of instructing children in the art of gardening is found in school gardens. It is interesting to note how widely the demand for these has become. No head teacher of a boys' school now regards his school work or curriculum complete if it does not comprise lessons on gardening, and these lessons are given in properly organised school gardens. So far these gardens generally have been limited to boys, although I have seen some pretty ones devoted exclusively to flowers and cultivated by girls. When these small gardens are controlled by a teacher who is, as so many are, good amateur gardeners, or by some local working gardener, the boys are taught to do on their plots just the work they would be required to perform in market, gentlemen's, or their parents' gardens. One great need, indeed, almost an imperative need, in relation to this school gardening is that, wherever there is such, there should also be established a group of larger plots, on which the lads could continue their work and instruction for two years, or

longer, after they have left school. Those may come in time. Some day, it is hoped, the Council of the Royal Horticultural Society will organise in London an exhibition of elementary school gardening. *A. Dean.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 6.—The usual fortnightly meeting of the committees was held on this date. The display of fruits and flowers was quite the smallest seen in the new hall, due, probably, to the date falling immediately after a Bank Holiday. Although few, the exhibits were of first-class quality, and especially meritorious was a display of about 100 varieties of Gooseberries staged by Messrs. Jas. Veitch & Sons, a group of *Nymphæas* from Gunnersbury House Gardens, and a collection of *Glaucolus* flowers from Messrs. Kelway & Son's collection.

Many novelties were presented to the FLORAL COMMITTEE for awards, and of these two received First-Class Certificates, and four Awards of Merit. The greatest novelty was the scarlet *Eucalyptus ficifolia*, quite the handsomest species of the genus and rarely seen in flower in this country.

The ORCHID COMMITTEE granted two First-Class Certificates and one Award of Merit.

At the meeting of Fellows, held at 3 p.m., 32 names were submitted and accepted for membership, and a Paper was afterwards read by Mr. Arthur Bedford, of Gunnersbury House Gardens, Acton, on "*Hardy Nymphæas*."

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. Chas. T. Druery, H. B. May, Geo. Nicholson, T. W. Turner, J. T. Bennett-Poe, Chas. E. Shea, Jas. Douglas, J. F. McLeod, W. T. Ware, John Jennings, W. Bain, Chas. Dixon, A. Turner, Wm. Cuthbertson, H. J. Cutbush, E. H. Jenkins, James Walker, and W. J. James.

A group of exceptional merit was composed of hardy *Nymphæas*, with a setting of tall members of other aquatic species. This was exhibited by LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. James Hudson). In the centre of the group were blooms of the tall *N. gigantea* Hudsonii, with pale-blue, globular-shaped flowers, and *N. stellata*, also blue, with pointed segments and very erect peduncles. Another species of this type is *N. pulcherrima*; the blue of the petals is set off by a yellow colouring at the base. Among the darker-coloured flowers may be mentioned the variety William Falconer, with claret colouring, and *N. gloriosa*, a handsome flower of a shade of rose. *N. Marliacea chromatella* is pale yellow, and *N. collosa*, the largest of all exhibited, is flesh colour. Interspersed in the group were flowers and foliage of *Alisma plantago*, *Butomus umbellatus*, *Calamus acorus*, *Typha latifolia*, *Cyperus longifolius*, *Spiræas*, &c. (Silver Flora Medal.)

Mr. JAMES DOUGLAS, Edenside, Great Bookham, Surrey, showed a small but choice exhibit of Border Carnations. Quite the handsomest in the collection was the scarlet variety Robert Berkeley, with well-formed flower of large size, and rich colouring. "Charm" is a "Fancy" Carnation with rose makings on a white ground. Miss Willmott, Lara (flushed rose on a yellow or buff-coloured ground), Black Prince (deep purple), Victoria (cinnabar), Prof. Cooper (dull lavender), and Liberté are other good varieties. (Bronze Flora Medal.)

MESSRS. JAMES VEITCH & SONS, LTD., Chelsea, showed a semi-circular group of interesting plants, including *Romneya Coulteri*, *Astilbe grandis*, with erect plumes of small, white flowers, and sprays of *Clethra canescens*, with long racemes of white flowers.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed an extensive collection of sprays of ornamental-leaved and showy-flowered trees and shrubs. The exhibit filled the whole of a long table that extended the entire length of the building. In it were varieties of *Populus*, *Rhus*, *Privets*, *Ericas*, *Ivies*, *Maples*, *Weigelas*, *Elders*, *Photinias*, *Cornus*, *Olearias*,

Spiræas, Eleagnus, Cotoneasters, Osmanthus ilicifolius latifolius albus, Fuchsias, Liriodendron, Jasminum Wallichianum, Loniceras, &c. (Silver Flora Medal.)

Messrs. KELWAY & SON, Langport, Somerset, made a fine display with flowers of their noted strain of Gladioli. The exhibit was replete with many beautiful varieties, but we have seen a finer display staged by this firm. As a selection, we may enumerate Zanonii (purplish-mauve), Queen Alexandra (scarlet), Muchelney Abbey (scarlet, with a lemon-coloured marking on the lower petal), Thais (magenta), Hannibal (salmon), Mrs. Alfred Mond (a pale flower faintly marked with rose and with a yellow lip), and Ragged Robin. (Silver-Gilt Flora Medal.)

Messrs. DOBBIE & Co., Rothesay and Marks Tey, showed a large number of seedling Dianthus Heddewiggii and D. lacinatus, with a few named varieties, and spikes of Oenothera (Godetia) Schamini, which formed the subject of the Supplementary Illustration in our issue for November 17, 1906. The Dianthus were in great variety; some were heavily marked with crimson, others had slight markings. D. lacinatus had deeply-cut petals. Amongst the named flowers were Salmon Queen, Crimson Bell (a very dark-coloured variety), Snowball, Fireball, and violaceous. (Silver Banksian Medal.)

Mr. HOWARD CRANE, 4, Woodview Terrace, Highgate, London, N., showed miniature-flowered Violas of the type known as Violettas. The flowers were shown in fancy bowls that were filled with sand, and arranged in this manner, they were especially pleasing. Varieties that were particularly noticeable included Violetta, the original variety of this type, a white flower with a yellow blotch on the lower petal; Miss G. Jekyll, yellow, with a deeper shade in the lower petals; Purity, an improved Violetta; and Eileen, deep blue, with a yellow centre. (Silver Banksian Medal.)

Mr. G. REUTHE, Hardy Plant Nursery, Keston, Kent, showed many interesting hardy flowers. We noticed Berberis corallina, Desfontania spinosa, Gloriosa superba, Eugenia myrtifolia, Morina longifolia, Veratrum nigrum, &c. (Bronze Flora Medal.)

Mr. AMOS PERRY, Enfield, Middlesex, showed seasonable hardy flowers, several varieties of Campanula nobilis, Michauxia campanuloides, Cedronella cana, hardy Nymphaeas (including the variety Arc-en-Ciel, the foliage of which is of diverse colours), Lilium superbum, L. Humboldtii magnificum, L. dalmaticum, and other species of Liliums furnished the principal features of an excellent exhibit. (Silver Flora Medal.)

Messrs. G. & A. CLARK, Dover, Kent, displayed an assortment of hardy flowers, spikes of showy Gladioli, vases of Sweet Peas, and others of Border Carnations. Ipomopsis elegans picta has Grevillea-like foliage and long, tubular, red flowers. Amongst the Carnations was noticed a "fancy" variety of merit, with rose markings, named Mrs. Norman Leete. (Silver Flora Medal.)

An excellent display of hardy flowers of well-known species was shown by Messrs. ARTHUR CHARLTON & SON, Summervale Nursery, Tunbridge Wells, Kent. (Silver Flora Medal.)

Mr. GEORGE ARENDS, Ronsdorf, showed a number of hybrid Astilbe japonica, with flowers of many shades of rose. (Silver Flora Medal.)

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr. Mr. Bain) showed several interesting plants. Crinum augustum is a large-flowered species; the stout peduncle bears a number of flowers with long segments, suffused with deep claret colour. Arctotis regalis is a hybrid raised from A. aureola × A. grandis. The flowers are as large as those of Chrysanthemum maximum. The ray florets are pure white, with a yellow base; the disc florets are a shade of blue. Crossandra undulatafolia has dense spikes of orange-coloured flowers, that are admirably set off by the deep green, leathery foliage.

A. MARC, Esq., Champneys, Tring (gr. Mr. T. W. Cowburn), showed a variety of Acalypha musaica named Mrs. Marc.

H. W. PERRY, Esq., Upper Norwood (gr. Mr. J. Buckingham) showed plants of Gloxinias, freely flowered in a setting of small Ferns and Isolepis gracilis. (Silver Banksian Medal.)

AWARDS.

FIRST-CLASS CERTIFICATES.

Eucalyptus ficifolia (see *Botanical Magazine*, tab. 7,697).—A branch of this species was shown in flower by W. NORTH ROW, Esq., Cove House, Tiverton, Devon. The individual flowers are about 1½ inch across, and they are crowned by a row of stamens with brilliant scarlet-coloured filaments, to which the flower owes its beauty. The elongated calyx tube is white, and the peduncles are suffused with a reddish tinge in their lower halves. The inflorescence is corymbose, there being from 15 to 20 flowers in a "head." The flower-buds are charming; each is furnished with a kind of operculum, or little lid, which is thrown off and reveals the stamens all radiating towards the centre. The foliage is leathery, and may be likened to that of *Ficus elastica*, but with a very acuminate apex.

Nymphaea "atro-purpurea."—This richly-coloured Water Lily received an Award of Merit on July 31, 1906. A description and full-page illustration of the flower appeared in our issue for February 16, 1907. Shown by Lord HILLINGDON, Uxbridge (gr. Mr. Allan).

AWARDS OF MERIT.

Gladiolus Duke of Richmond.—A broad, expanded flower of a delicate shade of pale rose, with deeper markings of rose. The lower petal is white, with a blotch of yellow, and spotted with rose. Shown by Messrs. KELWAY & SON, Langport, Somerset.

Matricaria inodora "Bridal Robe."—This may be likened to a double white-flowered Pyrethrum roseum. The flowers are about 2½ inches in diameter, and many are produced from a single stem. Shown by Messrs. TITT & SON, Windsor.

Campanula longistyla.—A lax-flowering species, with the tall habit of *C. pyramidalis*, and flowers like those of *C. carpatica*. The hanging, bell-shaped flowers are a shade of heliotrope or blue; each is rather more than an inch in depth, and the same measurement at the mouth. This species forms a suitable subject for planting in big clumps against a background of shrubs. Shown by Sir TREVOR LAWRENCE.

Carnation King Edward VII.—A heavily-marked "fancy" Carnation. The ground is white, and this is blotched and striped with dark crimson. The flowers measure 5 inches across. Shown by Mr. JAMES DOUGLAS.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Fred J. Hanbury, W. Boxall, R. G. Thwaites, H. A. Tracy, W. P. Bound, J. Charlesworth, W. H. Young, H. G. Alexander, W. H. White, F. J. Thorne, H. Ballantine, J. Wilson Potter, W. Bolton, and De B. Crawshay.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, were awarded a Silver Flora Medal for a group composed principally of rare species of Orchids and hybrids raised at Heaton. Among the former was a splendid plant of *Mormodes luxatum punctatum*, with a fine spike of fragrant white flowers; the curiously-twisted labellum has a purple band, and spotting of the same colour. The elegant little *Pleurothallis macroblepharis*, with gnat-like flowers, was noticed; also *Oncidium nigratum*, with white flowers barred with chocolate colour; *O. trulliferum* and other *Oncidiums*; *Ionopsis utricularioides*, the rare *Maxillaria marginata*, two specimens of the bluish-white *Zygopetalum rostratum*, *Bifrenaria aureo-fulva*; several finely-flowered *Ancistrochilus Thomsonianus* variety *Gentilii*; a fine white *Cattleya Gaskelliana* and other *Cattleyas*, and two examples of the new *Dendrobium regium* (see Awards). The hybrids included good examples of the Heaton strain of *O. Rolfeae* and *O. crispoharryanum*; *O. Elaine*, a pretty cross between *O. cirrhosum* and *O. Harryanum*; some brightly-coloured *Laelio-Cattleya callistoglossa*, *Cattleya F. W. Wigan*, *Sophro-Laelia Marriotiana*, *Sophro-Cattleya Chamberlainiana*, and various *Cypripediums*.

H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. Day), was awarded a Silver Banksian Medal for an effective little group, in the centre of which was the brightly-coloured *Laelio-Cattleya Massangeana*, variety "Harry Goodson,"

which had previously secured an Award. With it were a clear, white form of *Cattleya Gaskelliana alba*, with a fine spike of three flowers; *Miltonia Bleuana*, several *M. Roezlii alba*, the rare violet-lipped *Dendrobium Williamsianum*, a fine variety of *Odontoglossum crispum*, *Laelio-Cattleya elegans*, a prettily-marked form of *Odontoglossum amabile*, &c.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed a splendid plant of *Miltonia vexillaria*, Hardy's variety, with 46 pretty rose-pink flowers: a dark, crimson mask is seen at the base of the lip; also a grand specimen of *Cattleya Germania superba*, with 32 flowers (see Awards), and a flower of *Laelio-Cattleya elegans* King Edward, a very large purple variety, and the best of its class.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), again showed the fine *Aërides Houlettianum*, "Fowler's variety," for which a First-Class Certificate was given at the meeting held on July 17, 1906. The yellow of the petals and the rose colour of the front of the lip was deeper on this occasion than in the flowers shown last year.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya Minnie* (*granulosa* × *Lueddemanniana*), with cream-white sepals and petals tinged with pale lilac and a bright rose-purple lip margined with white; *Laelio-Cattleya* Mrs. Gilbert Blount (*L.-C. Schilleriana* × *C. Gaskelliana*), an improvement on *L.-C. Henry Greenwood*, and having sepals and petals milk-white, tinged with pale purple; disc of the lip lemon-yellow, the sides rose-colour, and the broad front glowing crimson-purple; *Cypripedium Godefroyae leucochilum* "His Majesty," a large cream-coloured flower bearing claret-coloured markings on the sepals and petals; and *C. Emperor of India* (*Harrisianum superbum* × *C. grande*), a large and dark-coloured flower.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a small group of hybrid *Odontoglossums*, in which were three of the exhibitor's fine strain of *O. Queen Alexandra*, one of which had the large and beautiful labellum covered with violet-purple blotches; the new *O. Amneris* (*cristatellum* × *Crawshayanum*), and other hybrids.

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound), sent *Epi-Laelia longiciliare* (*Laelia longipes* × *Epidendrum ciliare*), a very singular little hybrid with linear sepals and petals of a bluish-white tint and small tri-lobed yellowish labellum.

R. G. THWAITES, Esq., Streatham (gr. Mr. Black), sent *Brasso-Laelia Thwaitesii* (*L. majalis* × *B. Digbyana*), with long and narrow sepals, tinged with lilac, the broader petals being similarly coloured but darker and irregularly broadened in the middle, the distinctly three-lobed lip being white, tinged with rose on the side lobes and tip of the front lobe, both of which have jagged edges.

Messrs. HUGH LOW & Co., Enfield, showed a finely-flowered *Platyclinis filiformis*, *Cattleya Gaskelliana alba*, *C. Parthenia Prince of Wales*, *Cypripedium Wiertzianum*, and *C. Watsonianum*.

Sir TREVOR LAWRENCE, Bart., Burford (gr. Mr. W. H. White), showed *Laelia "Purple May"* (*majalis* × *purpurata*), a distinct hybrid with purplish lanceolate sepals and broader petals, the lip having a white tube with narrow dark lines running from the base to the showy purple front lobe.

AWARDS.

FIRST-CLASS CERTIFICATE.

Dendrobium regium, shown by Sir TREVOR LAWRENCE, Bart., and Messrs. CHARLESWORTH & Co.—A very fine species, described some years ago by Dr. Prain, and recorded as a native of Lower Hindustan, but now shown for the first time. The plant, when not in flower, might be mistaken for *Dendrobium nobile*, which is its nearest affinity. The flowers, also in colour, bear some resemblance to those of *D. nobile*, but the usual dark blotch on the lip is not present in *D. regium*. The largest flower was over 4 inches across, and the petals much broader than in *D. nobile*. The sepals and petals are clear rose colour, the base of the lip being white, with a yellow disc, the pointed front portion being rose of a slightly darker tint than the other segments.

Cattleya Germania superba (*C. granulosa* Schofieldiana × *C. Hardyana*), from Major G. L. HOLFORD. This is a very charming variety, with purplish rose sepals and petals, the front of the lip being ruby-crimson and the whole flower of fine shape and substance.

AWARD OF MERIT.

Miltonia vexillaria Lambeauiana, from Monsieur JULES HYE DE CROM, Conpure, Ghent (gr. Mr. Coen).—A beautiful pure white variety, with lemon-yellow crest, and without the reddish lines usually seen in forms of *M. vexillaria*.

CULTURAL COMMENDATION.

To Mr. H. G. Alexander (Orchid grower to Major G. L. HOLFORD), for a noble specimen of *Cattleya Germania superba* with four spikes bearing together 32 flowers.

To Mr. H. Ballantine (gr. to Baron Sir H. SCHRODER, The Dell, Egham), for a large and finely-grown specimen of *Cypripedium* Lord Derby, with 11 spikes bearing together 34 flowers.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the chair), and Messrs. J. W. Bates, Alex. Dean, Edwin Beckett, R. Lyne, A. R. Allan, James Vert, Wm. Pope, H. Parr, C. G. A. Nix, and J. Jaques.

The principal exhibit was an excellent collection of Gooseberries shown by Messrs. JAMES VEITCH & SONS, LTD., Chelsea. The exhibit embraced close upon 100 varieties; the fruits were shown in dishes, but many cordon and palmate-trained bushes were used as a background to the display. The small plants were heavily cropped with fruits of exceptional quality, and some were very large in size. A prominent position was afforded the variety Langley Beauty, a yellow-skinned berry, of the finest dessert quality. Its companion, Langley Gage, is a white variety, but of equal merit in flavour. Ironmonger, Golden Gem, Yellow Sulphur, Whitesmith, Red Champagne, Early Green Hair, and Bright Venus are all to be recommended for their flavour as dessert fruits. Amongst the largest berries were Dan's Mistake and Marlborough. At one end of the display were fruiting plants of Red and White Currants, with dishes of these fruits, and the black, including Baldwin's Black and Black Naples. Messrs. VEITCH also exhibited a group of Figs, Peaches, and Grapes in pots. The Figs included the varieties White Ischia, Brown Turkey, Brunswick, and White Marseilles, and of Peaches there were Sea Eagle, Thomas Rivers, Dymond, and Belle Bauce. (Gold Medal.)

Messrs. S. SPOONER & SONS, Hounslow, exhibited a small collection of early varieties of hardy fruits, Apples, Plums, Cherries, &c.

Messrs. SUTTON & SONS, Reading, showed three varieties of Cabbage. "Earliest" Cabbage has a large conical solid heart: there were also Tom Thumb and Earliest of All Savoy.

THE LECTURE.

At the afternoon meeting of Fellows the subject of hardy Nymphæas was dealt with in a paper read by Mr. A. Bedford. The cultivation of Water-Lilies is simple; all the plants require is some good soil or rich mud, such as is found at the bottom of naturally-formed ponds and lakes, and plenty of water above them. They should not be allowed to remain for many years undisturbed, but should be dug up occasionally and divided, otherwise, said Mr. Bedford, the foliage will grow so abundantly and vigorously as to quite hide the flowers. Lakes or ponds that are exposed to full sunshine, but sheltered from high winds, afford the most suitable places for planting Nymphæas, but they may be grown and flowered with success in cement tanks, or even in tubs. A lake, if employed for the accommodation of choice aquatic plants, should be kept free from all coarse-growing weeds. In all cases the natural mud at the bottom of the water will form the best rooting-medium for Nymphæas. An easy method of planting is to place the crowns in shallow baskets filled with loam, and to sink these into the proper positions by means of heavy stones, &c. When the basket has rotted, the roots will penetrate through into the bed of the pond. Large plants may be placed in position by merely sinking them with some heavy weight attached. In artificial ponds or tanks,

a copious flow of fresh water is not essential, but a tiny stream should be allowed to enter to prevent a stagnant condition. In small tanks a layer of soil to the depth of 10 or 12 inches should be spread over the bottom, and in larger structures little mounds or hillocks should be formed, by piling a few sods. A suitable rooting medium for Nymphæas consists of good, turfy loam, plenty of half-decayed leaves, and some sharp sand. This should be prepared a considerable time before it is required. Manure should not be used. The best season for planting is the spring, at about the end of April or the beginning of May, for if planted at that time they will flower before the current summer is passed. The flowering season is from early in June to October. The depth of water should be 4 feet for the stronger-growing kinds, and not less than 1 foot for the smaller varieties. All the Marliac type should be planted in deep water.

Some of the finer varieties are slow-growing, and are propagated with difficulty from side crowns, but others are easily increased by this means. Varieties of the N. Laydekeri section are extremely difficult to increase. Some varieties are easily raised from seed, which should be sown as soon as it is ripe. For cultivating in tubs, the Laydekeri type is the more suitable, and of these the smallest forms are the best. The tubs should be wide at their mouth and about two feet in depth. A small stream can be made to feed a series of tubs, and thus save much labour. The tubs should be sunk into the ground, as, by this system, the plants can be easily protected by boards, &c., in winter.

Aphides are sometimes troublesome, and should be destroyed by tobacco powder, or they can be washed off by a stream from the hose.

Water-fowl and water-rats should not be permitted near these plants.

A malformation is a common cause of trouble to Nymphæas; the stem becomes fasciated, and then produces nothing but foliage. The rhizome in this case should be cut into very small portions, and be planted afresh.

Among the best varieties are gloriosa (rich carmine), Marliacea chromotella, M. odorata sulphurea (two of the best yellow-flowered varieties), Ellisiana, atro-purpurea, sanguinea, and William Falconer (dark-flowering kinds), James Brydon (rosy-crimson), Gladstoniana, and Marliacea albida (white).

BRITISH ASSOCIATION.

SECTION K.—BOTANY.

AUGUST 1.—The presidential address in this section was delivered on the above date by Professor J. BRETLAND FARMER, F.R.S., who dealt with certain aspects of botany, which, as he himself said, belonged rather to the nebulous region of speculation than to the hard ground of facts.

Professor FARMER laid stress upon the advantage of maintaining a physiological attitude of mind towards the phenomena presented by the vegetable kingdom, since it involved the necessity of constantly attempting to analyse the problems which presented themselves to students of botany, as far as possible, into their chemical and physical components. The explanation of the advances which chemistry and physics had made lay essentially in the fact that an analysis of the factors involved had enabled the investigator intelligently to interfere with and so to control the mode of presentation of the reacting bodies. The botanists' special problems, including the obscure matters of organisation, heredity, and the like, were assuredly susceptible of a similar method of treatment. They could never expect to get further than to be able to modify the mode of presentation to each other of the materials that interacted to produce what were called the manifestations of life, but the measure of their success would depend on the degree in which they were successful in accomplishing that. Indeed, until they had analysed the nature of the reacting bodies and also the particular conditions under which the reactions themselves were conducted, they were avoiding the first steps in the direction of ultimate success. In this connection he thought that much harm was done by the toleration of an uncritical habit of mind as to the significance of structures which were regarded as adaptive responses to stimuli of various sorts. It was not enough to explain the appearance of a structure on the ground of its utility. One of the

commonest responses to the stimulus of wounding in the higher plants was the formation of a layer of cork over the injured tissue. That was a reaction of great utility, checking as it did the undue evaporation of water and the entrance of other parasitic organisms. Yet it could not be seriously maintained that the obviousness of those advantages satisfactorily explained why the cork layer was produced. It seemed to him that an investigation of the real underlying conditions which governed such a modified reaction would be of immense value, and that the information to be gained therefrom as to the nature of the chemical process involved would prove to be of first-rate importance in tracking to their sources some of the factors that influenced the course of carbohydrate metabolism within the cell. He devoted the rest of the address mainly to the discussion of certain abstruse problems relating to karyokinesis—i.e., the changes which take place in the nucleus of a living cell when undergoing the process of division; and concluded by observing that the problems which arose were seen, when grappled with at close quarters, to resolve themselves more and more into questions of chemistry and physics. The reactions that went on in the living body were obviously guided as to the particular directions they took by the apparatus or mechanism of the individual organism. When the conditions for the manifestation of life were satisfied, what would be produced depended partly on the structure of the apparatus itself (i.e., on the hereditary organisation), partly on the nature of the substances fed into the apparatus, and, finally, on the physical conditions under which it was working. It was probably along the last two lines that investigation would continue to be pursued with more immediate profit; but the goal would not be finally reached till they had solved the problem as to the nature of the organisation itself. *Times*, August 5.

BISHOPS STORTFORD HORTICULTURAL.

JULY 31.—The 38th annual exhibition of the above society took place on this date. The show was a great success, the only weak classes being those in the hardy fruit section. Some of the cut flowers, notably Sweet Peas and Roses, showed damage from the recent storms, but those in the herbaceous collections were very fine. Mr. G. Beech, gardener to JOHN BARKER, Esq., M.P., won the Silver Cup and the Royal Horticultural Society's Silver Medal for the best collection of these flowers.

GROUPS.

These were an excellent feature, some splendid exhibits being staged. The premier award in the large class was won by the Right Hon. Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. Jas. Vert); 2nd, Mr. Beech, gardener to J. BARKER, Esq., M.P., The Grange, Bishops Stortford.

In the smaller class for a group of plants, Mr. F. A. TAYLOR, Bishops Stortford, won the 1st prize, and he was followed by Mr. GOODWIN BARNES. The 1st prize for Begonias was won by Mr. F. A. TAYLOR with splendid plants. Mr. GOODWIN BARNES was a close 2nd with plants less advanced in flower, but of excellent quality.

Mr. J. VERT had the best collection of foliage plants. Mr. WOODS showed the best Ferns, and Mr. TAYLOR had the best half a dozen single and double-flowering Begonias. Mr. TAYLOR also showed the best Gloxinias.

TABLE DECORATIONS.

Decorated tables are a special feature at this show. There were over 30 tables on this occasion. The premier award was gained by Miss CLAYDEN, Saffron Walden. This lady used Carnation flowers, Grasses, and Heuchera sanguinea.

CUT FLOWERS.

Roses were well shown, considering the adverse season. Mr. F. E. CROFT had splendid blooms in the principal class for these flowers, and was awarded the 1st prize. In a small class, Mr. ROSS and Mr. GEE were the leading exhibitors. Sweet Peas formed a pleasing attraction. For a collection of these flowers, J. BARKER, Esq., M.P., was an easy 1st prize winner, having grand blooms and many varieties; Mr. E. E. PEARSON was awarded the 2nd prize.

Mr. P. L. JOHNSON won the prizes offered by Messrs. Eckford. In a class for 12 blooms of Chrysanthemums, Mr. JOHNSON was the only exhibitor. In the open class for flowers of herbaceous or bulbous plants, Messrs. PAUL & SON, Cheshunt, had the winning exhibit.

FRUIT AND VEGETABLES.

In a class for the best collection of eight dishes of fruits, some excellent produce was staged. Mr. W. Harrison, gardener to Col. ARCHER HOUBLON, Hollingbury Place, was awarded the 1st prize; he had splendid Grapes, Peaches, Cherries, Nectarines, Melons, and Strawberries. 2nd, Mr. MEYER.

Colonel BALFOUR had the best Black Grapes in a strong competition, and this exhibitor showed the best bunches of Muscat of Alexandria; also the best of Madresfield Court, and the premier dish of Peaches.

One very large tent was entirely devoted to vegetables, and competition was keen in many of the classes. In the class for a collection, six exhibitors staged excellent produce. Mr. Jeffries, gardener to J. BALFOUR, Esq., was a good 1st, having splendid Cauliflowers, Quite Content Peas, an excellent dish of Perfection Tomatoes, Snowball Turnip, Model Carrots, and shapely tubers of Syon House Prolific Potatoes. 2nd, Mr. BEECH.

In the smaller classes Messrs. GEE, KINDELL, and W. HOLLAND were the leading prize-winners.

HONORARY EXHIBITS.

A noteworthy group of fruit trees in pots was staged by Messrs. RIVERS & SONS, Sawbridge-worth. They showed grand examples of their new Peregrine Peach, Apricots in variety, Emperor Francis and Turkey Black Heart Cherries, Figs, the small but delicious Gradiska Grape, &c. Messrs. PAUL & SON, Cheshunt, showed splendid Roses. Messrs. KING, Coggeshall, displayed Sweet Peas. Messrs. BURCH, Peterborough, exhibited Roses. Messrs. CHAPLIN, Waltham Cross, showed Sweet Peas. Mr. DIXON, Bishops Stortford, staged foliage and flowering plants in variety. Messrs. RIDING, Chingford, had an assortment of Violas. Mr. J. DOUGLAS, Great Bookham, staged a fine collection of Carnations.

SCOTTISH HORTICULTURAL ASSOCIATION.

AUGUST 3.—At the invitation of Messrs. Storrie and Storrie, some 50 members of the above association visited the firm's nurseries at Glencarse, in the Carse of Gowrie, on the above date.

After the nursery had been inspected by the members a conference was held, and the proceedings were largely devoted to a discussion of the summer pruning of fruit trees.

CATALOGUES RECEIVED.

CLIBRANS, Altrincham & Manchester—Strawberries, Vegetables and Flower Seeds.

DAVID W. THOMSON, 113, George Street, Edinburgh—Bulbs.

T. SMITH, Daisy Hill Nursery, Newry, Ireland—Hardy Bulbous Plants.

W. BULL & SONS, Chelsea, London—Bulbs.

AUSTIN & McASLAN, 89, Mitchell Street, Glasgow—Bulbs, Roots and Plants.

C. J. ELLIS, Weston Nurseries, Knightstone Road, Weston-Super-Mare—Bulbs.

THOS. DAVIES & Co., Wavertree, Liverpool—Bulbs.

DEBATING SOCIETY.

GUILDFORD AND DISTRICT GARDENERS'.

—On Wednesday, July 17, this society's third annual show was held at Sutton Place, by kind invitation of Lord and Lady Northcliffe. The attendance of visitors was a very large one. The show was favoured with ideal weather, and the general arrangements were admirable. There were 74 exhibits by 33 members, as compared with 66 and 28 respectively last year, while the quality was far in advance of anything the society has produced before. The largest exhibit was that staged by Mr. J. Goatley, gardener to Lord and Lady Northcliffe, who showed a magnificent collection of plants, flowers, vegetables and fruit.

MARKETS.

COVENT GARDEN, August 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

Leeks, 12 bundles	1	6-—	— small selected, per dozen lbs.	2	6-29
Lettuce (English), Cos, per score	0	4-06	Turnips (English), doz. bunches	2	0-3
Marrow (English), per tally	3	0-4	Watercress, per doz. bunches	0	4-06

REMARKS.—English Black Currants have advanced considerably in price during the week, but there is only a moderate demand for the Red and White varieties. Pears Williams Bon Chretien, from France, and Beurré Hardy, from California, are now obtainable. French "Gages" are arriving in fine condition, and the dessert varieties are realising high prices. Lemons are much cheaper than is usual at this season of the year. Specialities in fruits seen in the market are the Naartjes or Mandarin Oranges from Natal and the Cape. P. L., Covent Garden Market, August 7, 1907.

POTATOS.

Kents, 3s. to 4s. per cwt.; Bedford's, 70s.; Lincolns, 60s. to 70s.; Blacklands, 60s. to 65s. per ton. Supplies are large and the demand is fair. J. D. C., Covent Garden, Aug. 7, 1907.

COVENT GARDEN FLOWER MARKET.

The flower market is very dull, and many of the salesmen are on holiday. Zonal Pelargoniums are still obtainable in both 60's and 48's pots. Plants of Ivy-leaved varieties in 48's pots are well flowered. Verbena Miss Willmott is in as good a condition now as at any time during the season. Coreopsis is very pretty. Campanula isophylla alba and C. Mayi are now at their best. Mignonette, Spiraea japonica, Marguerites, Heliotropiums, Fuchsias, Asters, Hydrangea Hortensia, and H. paniculata grandiflora, Crassulas and Coleus are the principal plants seen on the stands. Kochia scoparia (or trichophylla) does not sell so well as when it was first introduced. I find there is still some confusion regarding the names. The supply of Rambler Roses is not yet finished, some of the plants are rather far advanced. Ferns, Palms, and other foliage plants are well supplied.

CUT FLOWERS.

Trade is bad and much material has to be wasted. Asters are already seen in large quantities; those imported from France affect the prices for the home-grown flowers. Some fairly good Chrysanthemums are arriving. Blooms of Chrysanthemum maximum of the improved varieties are seen in immense quantities. Statice in white, blue and yellow colours is over plentiful. If desired to keep this flower dried for the winter it should be purchased before it is too far advanced, then it will keep its colour. Gypsophila paniculata is seen in large heaps, its market value has depreciated very much. Irises are not quite over. Gladioli are abundant, and G. Brechtleysensis has dropped in price. Roses are still very abundant, and it is only the very best quality blooms that make reasonable prices. Good blooms of Kaiserin Augusta Victoria could be purchased at 3d. per bunch on Tuesday morning, and there was no improvement in prices this morning. Carnations are equally abundant, and large quantities are from the open ground. The variety Raby Castle is grown largely, and another seen is Duchess of Fife. The perfume of Lavender now pervades the market, and the hawkers deal largely in this flower. A. H., Covent Garden, Wednesday, August 7, 1907.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 3, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was changeable and unsettled over the whole Kingdom, but rain was more frequent in the north and west than elsewhere. Thunderstorms occurred in the south-east of Scotland, thunder at Donaghadee on Monday, and in many places in the Midlands and south-east of England on the following day.

The temperature was below the normal in all districts, the deficit ranging from 4° in Scotland E. to rather less than 1° in Ireland S. The highest of the maxima, recorded on irregular dates, were 75° in England E. and the Midland Counties, and 73° in several other districts. In Scotland N. and E. the thermometer only reached 69°, and in Ireland N. 68°. The absolute minima were low for the time of year. In Scotland E. the thermometer fell to 35°, in Scotland N. to 37°, and in England E. and S.W. to 39°. Elsewhere the minima ranged from 40° in many parts of England and in Scotland W. to 44° in Ireland N., and to 46° in the English Channel. The lowest grass readings reported were 28° at Balmoral and 32° at Llangammarch Wells.

The mean temperature of the sea was lower than during the preceding week on many parts of the Irish and Scottish coasts—as much as 4° at Lamlash. The actual values ranged from 63.4° at Seafeld and 62.6° at Margate to 51.7° at Lerwick.

The rainfall varied much in different parts of the Kingdom. In Ireland there was a considerable excess, and in England N.E. and the English Channel a considerable deficit. More than an inch was measured at Arlington on Friday, and also along the west coast of Ireland both on Friday and Saturday.

The bright sunshine was below the average over the Kingdom generally. The percentage of the possible duration ranged from 43 in the English Channel and England E., and 42 in England S. to 25 in Ireland N., 22 in Scotland E., and to 18 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending August 7.

Eleven-and-a-half hours continuous rain.—Taken as a whole the past week proved cold for the time of year. On the warmest day the temperature in the thermometer screen rose to 74°, which is only about 3° above the average for the beginning of August. On the other hand, on the first two nights of the week the thermometer exposed on the lawn registered readings only 5° above the freezing point. At 2 feet deep the ground is at the present time 1° colder, and at 1 foot deep 2° colder, than is seasonable. Rain fell on three days, but to the total depth of only half an inch. Nearly the whole of this amount, however, was deposited during the night of the 2nd, when rain began to fall at 7 p.m., and continued without intermission until 6.30 a.m. on the following day, or for 11½ hours. This fall proved sufficient to cause a few drops to trickle daily through the percolation gauge on which short grass is growing, while about a gallon of rain-water has passed through the bare soil gauge. The sun shone on an average for 7½ hours a day, or for 1½ hours a day in excess of a seasonable duration—making this the brightest week as yet of the present summer. The winds were variable in strength, but in no hour did the mean velocity exceed 14 miles—direction west. There was about a seasonable quantity of moisture in the air at 3 p.m.

JULY.

Very cold, calm and gloomy, with an exceptionally humid atmosphere.—This proved the coldest July experienced here in the past 19 years. During the course of it there occurred only seven unseasonably warm days, and only nine warm

nights. On the warmest day the temperature in the thermometer screen rose to 77°, and on the coldest night the exposed thermometer fell to within 3° of the freezing point, both very low extreme readings for the month. Rain fell on 16 days, and to the aggregate depth of 2½ inches, which is slightly in defect of the July mean. More than half of the total rainfall was deposited on two consecutive days towards the end of the month. The sun shone on an average for only 5½ hours a day, or for more than an hour less than a seasonable duration. During the past 21 years there have been only three other Julys as gloomy. It was also a remarkably calm month; indeed, with one exception, the calmest July I have yet recorded here. The most noteworthy feature, however, was the unusual quantity of moisture in the atmosphere. At 9 o'clock in the afternoon the mean amount was as much as 9 per cent. in excess of a seasonable quantity for that hour, or greater than in any July during the past 19 years. E. M., Berkhamsted, August 7, 1907.

Obituary.

GEORGE MAY.—We regret to record the death of this well-known nurseryman, at his residence at Upper Teddington, on August 1. During the winter of 1906-7, the late Mr. May suffered a bad attack of influenza. Coming to Teddington nearly 30 years ago, Mr. May engaged in the cultivation of plants for supplying flowers for the market, also Ferns for market, and built up a business of considerable magnitude. For nearly a quarter of a century he was one of the best-known personalities in Covent Garden Market. He was one of the first market growers to send blooms of red Roses to market, and the first consignments of these, General Jacqueminot, were sold at prices varying from 20s. to 30s. per dozen blooms wholesale. Adiantum Ferns, Lily of the Valley, and Roman Hyacinths were other subjects the deceased made specialities. In the cultivation of the Eucharis for market, it is doubtful whether his success has been equalled. More recently Mr. May will be remembered as one of the original introducers of the popular Carnation Uriah Pike, and of this variety alone some hundreds of thousands of plants in all sizes from rooted cuttings, to plants three years old and 4 feet in height were accommodated in his nursery. Locally, Mr. May will long be remembered for his large-hearted generosity, and it is doubtful whether his many kindly acts or his genial presence will be missed most. The funeral took place at the Teddington Cemetery at 3 p.m. on Tuesday, August 6. Various public and philanthropic bodies were represented at the funeral, together with a large number of prominent market growers and nurserymen. Mr. May was sixty-two years of age at the time of his death, and he leaves a widow.

HENRY WILLIAMS.—We are informed of the death of this nurseryman, a member of the firm of H. Williams & Sons, East Finchley, and Covent Garden Market. Deceased, who was in his 84th year, passed away on the 30th ult., after an illness extending over 10 days. He was a younger brother of the late Mr. B. S. Williams, of Holloway, and in former years was in practice in private gardening, being in 1857 in the service of Mr. Fairey, of Liverpool. Whilst at Liverpool, Mr. Williams was the first to flower Cypripedium Fairrieanum in this country, and here he produced a Black Prince Pineapple weighing 15½ lb. Deceased was a good plantsman and a successful exhibitor. He opened the nursery business at East Finchley in 1858, and for 42 years has been a contributor of produce to Covent Garden Flower Market. His specialities were Hyacinths, Tulips, Azaleas and Primulas. The firm will be carried on by his two sons. A third son is engaged as salesman in Covent Garden Market.

A SWEET PEA TRIAL.—On Wednesday, July 17, a number of persons interested in this flower visited the seed grounds of Messrs. E. W. KING & Co., Coggeshall, to inspect a trial of more than 300 rows of these plants. The visitors were shown nearly 20 acres of Sweet Peas growing for seed purposes, and over 300 trial rows.

THE LATE DR. MASTERS.—The owners of the Restiaceæ and other dried specimens of plants sent to the late Dr. MASTERS for identification are asked to write to Mrs. MASTERS at Mount Avenue, Ealing, to claim their property, as the botanical specimens may have to be disposed of shortly.

ANSWERS TO CORRESPONDENTS.

* * * The Editor will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for forming Supplementary Illustrations to this Journal.

ANIMAL IN POND: *Nymphaea*. The trouble is probably caused by water-rats.

BOOKS: *Beginner. Fruit, Flower, and Vegetable Trades Journal*, 1d. weekly: Biggs & Co., 139-140, Salisbury Court, Fleet Street, E.C.; *Fruit Grower, Fruiterer, Florist and Market Gardener*, 1d. weekly: Geo. Tucker, 1, 2, and 3, Salisbury Court, Fleet Street, E.C.

BOWLING GREEN: J. C. We find no trace of fungus, but the turf is covered with a common Lichen (*Peltigera*). This points to a stagnant condition of moisture in the soil. See that the land is properly drained, and encourage the growth of grasses by the use of nitrogenous manures. The grasses will in time crowd out the Lichen if the conditions for the growth of the former are favourable. The shrub is probably *Cotoneaster frigida*.

CHRYSANTHEMUMS DYING: Z. Y. X. The cuttings have been inserted too deeply, and they have in consequence formed a very indifferent root-system. Some of them also bear evidence of injury by insects. If you suspect the presence of wire-worm in the soil, apply a moderate dressing of gas-lime when the plants are removed, and allow the land to remain fallow for a few weeks. Bulbs are certainly liable to be eaten by this insidious pest if they are planted.

DISCOLOURED APPLE LEAVES. W. H. W. The leaves exhibit no trace of fungi, or apparently of insects. The cause of discolouration must therefore exist in the soil or result from injury by cold.

FIGS DISEASED: C. I. The plants are attacked by a fungus, *Cercospora Bolleana*. Burn the badly affected leaves and spray the remaining ones with permanganate of potash, or some other suitable fungicide.

FOLIAGE BEGONIAS: H. H. Probably your plants are old and declining in vigour. It would be well to raise fresh stock by division of the roots or by propagation from leaves. The treatment you describe seems to be quite correct. These plants do not like frequent waterings overhead, especially when grown in a cool atmosphere. Afford them shade from bright sunshine.

INSECTS EATING ROOTS: J. M. The small white insects attacking the roots of your plants belong to the genus *Lipura*. They are very nearly allied to the "Springtails," or *Poduridæ*, but they have no jumping apparatus. To destroy them, saturate the soil with some manure, such as nitrate of soda, or apply soot in as great a strength as the plants will stand. When the ground is cleared of crops, dress it with gas-lime or freshly burnt lime, and allow it to remain fallow for a period.

MELONS WITH SMALL SKIN-DEEP CRACKS: R. H. The conditions you have described are quite in accordance with the general practice. As you state that the plants appear healthy, the small cracks need not cause you alarm, it being merely the formation of what is known as "netting," and this adds greatly to the appearance of the fruit when ripe. It is, however, necessary at this stage to guard against any excess of moisture at the roots or in the atmosphere. Do not allow moisture to condense upon the fruit. If an excess of moisture is allowed in the atmosphere, the netting not infrequently takes the appearance of cracks, and these may develop a rusty appearance. Ventilate the structure freely, but with care, during the day and night, and keep the hot-water pipes sufficiently warm to cause a free circulation of dry and warm air in the house.

PEACH SHOOT DISEASED: *Derby*. The fruits and foliage are attacked by the Peach mildew, *Oidium leucoconium*. Smear flowers of sulphur made into a paste on the hot-water pipes, and ventilate more freely the house in which the trees are growing. Prevent an excess of moisture condensing on the leaves.

R.H.S. EXAMINATIONS: A. D. B. The names of the successful candidates are published in a pamphlet issued by the Royal Horticultural Society, and this can be obtained for a small sum from the secretary, Vincent Square, Westminster.

NAMES OF FRUIT: *J. C.* You should send foliage when submitting Peaches for naming, and not fewer than two fruits. The glands on the foliage are a valuable determining factor in naming these fruits. Your variety is probably Thames Bank.

NAMES OF PLANTS: *E. J. G.* 1, *Erigeron speciosus*; 2, *E. multiradiatus*; 3, *E. sp.*; 4, *Veronica longifolia rosea*; 5, *Dianthus deltoides*; 6, *Verbascum Blattaria*.—*G. W.* *Teucrium montanum*.—*Y. O.* 1, *Malva moschata*; 2, *Eryngium planum*; 3, *Spiræa callosa*; 4, *Phuopsis stylosa*; 5, *Chrysanthemum maximum*; 6, *Veronica virginica*.—*H. A.* 1, *Thalictrum glaucum*; 2, *Clematis recta*; 3, *Cephalaria tatarica*; 4, *Lotus siliquosus*; 5, *Scabiosa Pteroccephala*.—*A. J. S.* 1, *Fagus sylvatica v. heterophylla*; 2, *Sidalcea spicata*.—*F. L.* 1, *Pyrus Aria* var. *majestica*; 2, *Nyssa biflora*; 3, *Artemisia vulgaris*.—*W. G. B.* 1, *Carpenteria californica*; 2, *Rhus Cotinus*; 3, *Coriaria japonica*; 4, *Philadelphus purpureus maculatus*; 5, *Spiræa Thunbergii*; 6, *Clematis*

they commence to flower, when it will be better to remove them to a cooler atmosphere. These kinds are much more delicate than *R. africana* and will not thrive under the ordinary treatment accorded that species.

ROSES WITH DISEASED FOLIAGE: *J. C.* Your Rose leaves are badly attacked with the common "Rose leaf blotch," caused by the fungus *Actinonema Rosæ*. As far as possible, the diseased leaves should be collected and burnt. Spraying with diluted copper sulphates has been recommended. Some cultivators prefer to use *Eau Celeste*; this is made by dissolving two pounds of sulphate of copper in two gallons of hot water. In another vessel dissolve 2½ pounds of carbonate of soda in a like manner. Mix the two solutions, and when all reaction has ceased, add a pint and a half of ammonia, and dilute the mixture to 22 gallons.

CROWN OR MUMMY PEA: *X. Y. Z.* This is a singular variety of the common garden Pea.

is first tested, it is almost impossible to know when the roots require more water. In respect to the outside border we advise you to cut out a trench in the first week of October, at a distance of 4 feet from the vines, making this trench 3 feet wide and deep enough to extend to the drainage. Cut off all roots that are met with and refill the trench. The inside border can be treated in the same manner after two years have elapsed. Meanwhile protect the outside borders from rain by covering them with frame lights or any suitable material. Do not apply any more water to the roots this season.

TOMATO LEAVES DISEASED: *Fletcher.* The plants are affected by a fungus (*Cladosporium fulvum*). Spray the foliage with the Bordeaux-mixture, and destroy the badly affected plants by burning. Afford more ventilation to the structure in which they are growing, and keep the plants under drier conditions.

UTRICULARIA MONTANA: *F. Denis.* This plant

FIG. 45.—THE CROWN OR MUMMY PEA.

viticella.—*Aramel.* *Myoporum serratum* var. *tuberculatum*.—*A. T. B.* *Lilium croceum*.—*F. O.* 1, *Limnanthes Douglasii*; 2, *Campanula species*.—*Veritas.* 1, *Saccolabium miniatum*; 2, *Aerides odoratum*; 3, *Tainia barbata*; 4, *Eria convallarioides*; 5, *Acampe multiflora*; 6, *Selaginella africana*.—*F. T.* *Clematis Jackmannii*. The abnormal development is due to a fusion of growth, the leaf having been carried up and partly formed into a floral segment.—*Spondian.* 1, *Reseda fruticulosa*; 2, the Crown or Mummy Pea; 3, *Allium proliferum* (Tree Onion).—*G. D.* 1, *Hibiscus schizopetalus*; 2, *Combretum purpureum*.

RICHARDIAS: *Aroid.* If cultivated in the usual manner *Richardia* (*Calla*) *Pentlandii* and *R. Elliottiana* have probably already flowered and should now be ripening their growth. When the leaves have died off the stocks may be stored away for the winter in an atmospheric temperature of 55° to 60°. In the spring shake out the roots and repot them; after this has been done place them in a heat ranging from 60° to 65° and treat the plants similar to *Caladiums* until

The plant is of robust growth, about 4 feet in height; the foliage is rather small, the stem gross and succulent, and it becomes much fasciated near to the top, from whence the pods are all produced in a great bunch or cluster to the number of 30 or 40, forming a sort of crown on the top of the plant (see fig. 45). The story of its having been discovered growing out of an Egyptian mummy is fabulous.

SHANKING OF GRAPES: *X. Y. Z.* It may be too late to save the Muscat Grapes this season. The conditions that have caused the berries to shank are described in your letter. In the first place, the borders are 18 inches too deep, and the soil is far too rich. The roots have been over watered according to your letter, and this would be sufficient in itself to cause shanking. The liquid manure you applied would induce gross growth, which is also a contributing cause of shanking. Outside borders may get too much rain unless they are protected. There can be no rule in watering, such as applying liquid at every three or four weeks. Unless the border

should be grown in a basket and suspended in a warm house. It is a marsh plant and should not be dried off at any period of the year. It requires a rooting medium of sphagnum-moss, peat, and silver sand.

VINE LEAVES WITH WARTS: *T. T.* The excrescences are due to an excessive growth in the tissue of the leaf, caused by too close an atmosphere, and excessive heat and moisture. There is no fungus present.

COMMUNICATIONS RECEIVED.—Consul-General for the Netherlands—*J. V.*—*H. E.*—*S. W.*, you have not sent your name and address, but in any case we cannot insert advertisements in the editorial columns. *De B. Crawshaw*—*Dr. Plowright*—*F. P.*—*Dr. M. C. C.*—*T. W. B.*—*G. W.*—*A. THE ROSE SEASON.

NOTWITHSTANDING the depressing predictions of horticultural pessimists, the Rose season of this year has been wonderfully fine. At first our fairest garden treasures came through much atmospheric trouble; the buds which were primarily formed in June undoubtedly suffered greatly from the long absence of sunlight and the desolating influence of almost incessant rains; but Nature, as if repenting of her cruelty, ultimately smiled upon her flowers, with beneficent results. Never has the lovely Austrian Briar, *Rosa Harrisonii*, appeared in our gardens to greater advantage. This is one of the first Roses to open, and though it is, like most things of beauty, exceedingly transitory, it is of all Roses the sweetest while it lasts. As this precious acquisition is not arduous of culture, delighting in ordinary garden loam and a sheltered and mildly sunny situation, it should be much more widely cultivated than it is. I am surprised to find *Rosa Harrisonii* so seldom in the biggest gardens, when summer roses as a general rule are by no means ignored.

The picturesque Roses raised by Lord Penzance have also been supremely fascinating this season, such Hybrid Briars as *Jennie Deans*, *Lucy Ashton*, and *Meg Merrilies* being particularly fine.

Of the Hybrid Teas, whose name is legion, one of the first to flower profusely in my garden was *Papa Gontier*, a most prolific and attractive Rose, closely followed by *Warrior*, a splendid emanation, even finer than *Coralina*. Another new variety, a Hybrid Perpetual, which has achieved great distinction is *J. B. Clark*; it is most effective when not more than half blown. When this Irish introduction is fully expanded, it is an exceedingly large and open-hearted Rose. It has, I think, been over-estimated in comparison with *Hugh Dickson*, its lustrous predecessor. *Charles J. Grahame*, which keeps beautiful the memory of a very amiable, short-lived, earnest amateur rosarian, is also, though luminous in colour and gloriously fragrant, somewhat lacking in central petals; it is, nevertheless, by reason of its rich and rare complexion, a most attractive Rose. I am informed by a raiser of the greatest eminence that the "decorative" Roses, of which two of the finest representatives are *Irish Harmony* and *Irish Elegance*, are at present much more popular with cultivators than the larger and fuller Hybrid Perpetuals and Hybrid Teas. But, after all, the Roses that have been most effective, both here and elsewhere in this and former years, are such magnificent varieties as *Caroline Testout*, *Clara Watson*, *La France*, *Duke of Edinburgh*, *Horace Vernet*, *Viscountess Folkestone*, *Madame Alfred Carrière*, and *Bouquet d'Or*, which, in my estimation at least, are the Roses that chiefly glorify our gardens. The Duchess of Sutherland told me in a recent letter that the flowers which most impressed and astonished her, during a recent visit to Sicily, were the marvellous Hybrid Tea Roses. If we permit such Roses as these to be superseded by single or semi-double emblems of evanescence, we shall, I fear, go astray. Our annual exhibitions would suffer very materially from the absence of the full-fed floral giants to which I have referred. I venture to affirm that *Lady Gay*, however gracious in aspect and effusive of her gifts and manifold graces, would hardly make amends for the absence of *La France*.

Many of our largest and most effective Hybrid Teas also make magnificent climbers; *Margaret Dickson*, for example, has in my garden this season reached the height of 20 feet, flowering with fine artistic effect at that proud elevation, after arduous aspiration through a lofty Hawthorn hedge. This, I believe, eclipses its achievements in Australia and California, where the climate is almost ideal, and where it is assiduously and extensively grown. I should be greatly disposed to regard *Margaret Dickson* as the grandest Rose of its kind in cultivation, were it not for the superior size, form, and satin-like colour of that queen of all white Roses, *Frau Karl Druschki*, which I often think would be almost perfect had it only been endowed, in addition to its many incomparable attributes, with the exquisite fragrance of *Souvenir de S. A. Prince*.

One of the most grandly effective of all Roses this season has been *Madame Alfred*

Carrière, a Hybrid Noisette climber of great beauty, of most refined perfume, and wondrous floriferousness. Equally profuse in its flowering, and strangely contrasted in its colouring, has been *Bouquet d'Or*, the loveliest derivative from the venerable *Gloire de Dijon*.

Tea Roses, I fear, have not been seen at their best this season, for they have not yet recovered from long-continued adverse atmospheric experiences, but I am hopefully anticipating a successful later bloom. The Hybrid Perpetuals have, on the contrary, been almost as impressive as in former years, such crimson varieties as *Duke of Edinburgh*, *Horace Vernet*, *Cheshunt Scarlet*, and *Lady Helen Stewart* having, by their brilliant floral achievements, sustained their reputation. *David R. Williamson*.

LILIES WHICH FLOWER IN JULY.

WITH the practice that now prevails of retarding Lilies by keeping the bulbs in a cold-air chamber, flowering examples of most species may be had nearly, if not quite, throughout the year. To ensure this, glass accommodation and a certain amount of fire heat are necessary, but even when planted in the open ground the flowering period of the Lily extends from May to September.

The first to open is *Lilium pyrenaicum*, often called the *Yellow Martagon*, and when autumn frosts make their appearance the season ends with forms of *L. speciosum* and a few belated flowers of *L. auratum* and *L. tigrinum Fortunei*. The "Lily" month, however, is, I think, July, which was the month chosen for the great Lily conference held at Chiswick a few years ago, when such a representative collection of these noble flowers was brought together.

Many of the June-flowering Lilies extend into the following month, hence an entire list of those that bloom in July would amount to little more than a catalogue of most of the species in cultivation. Therefore, I propose to limit my remarks to a few of the very best Lilies, that are as a rule in the height of their beauty during the month named, and at the same time are not very exacting in their cultural requirements.

Of late years Lilies of this class have been planted on a broader and more extensive scale than was at one time usual. They are now frequently grouped among low or comparatively low growing shrubs, a most satisfactory method, as the tender shoots are in early spring protected from cold winds, while later the partial shade from sunshine thus afforded them is very beneficial. Added to this, the foliage of the shrubs serves admirably as a setting or background to the flowers.

In selecting shrubs for this purpose those of too dense a growth should be avoided, while those species of *Lilium* that require a loamy soil must not be associated with *Rhododendrons*, unless the *Rhododendrons* themselves are cultivated in fibrous loam.

Of the July-flowering Lilies which, effectually grouped, form such a striking feature in flower gardens or pleasure grounds, perhaps that which is most universally admired is the *Madonna Lily* (*Lilium candidum*). A native of the south of Europe, this species has been grown here for over three centuries, and is often seen at its best in cottage gardens. A fungus disease has given great trouble during late years, so that in many gardens where this species formerly flourished it cannot be grown. Still, my impression is that within the last year or two there has been a decided improvement in this respect. The *Madonna Lily* needs a well-drained loamy soil, and must, therefore, not be associated with *Rhododendrons* or other peat-loving

shrubs. The bulbs should not be buried very deeply, and if they have to be transplanted, the work should be done as soon as possible after the stems die down, because growth so quickly recommences.

Lilium Brownii, which, like *L. candidum*, is another of the Eulirion or tube-flowered group, flowers as a rule in the early part of the month. The typical form, as grown in Holland, reaches a height of about 3 feet, and bears long, trumpet-shaped flowers, which are heavily suffused with brown on the exterior, while the inside is of an ivory-white tint. Some forms of the Lily introduced from China within the last decade or so are altogether more vigorous than the type, and capable of producing a greater number of blossoms. Such are *L. Brownii leucanthum* and *L. Brownii chloraster*. The striking effect presented by the Chinese form of *L. Brownii* is well shown in the *Gardeners' Chronicle* for July 27 last, p. 67.

L. croceum is one of the upright or cup-flowered Lilies, which blooms as a rule in the first half of July, and is therefore largely in evidence in the Orange celebrations that take place in the northern part of Ireland. It is a remarkably handsome Lily, and one of the least exacting members of the genus. Like the Madonna Lily, it needs a loamy, rather than a peaty soil. The Orange Lily reaches a height of 3 feet to 5 feet, and bears a considerable number of flowers of a warm, reddish-orange tint. It is nearly related to the somewhat earlier flowering *Lilium dauricum*, but the individual blooms of *L. croceum* retain their brightness much longer than those of *L. dauricum*.

L. Hansonii is one of the Japanese members of the Martagon group, and differs from most species of that section in flowering well the first season after transplanting, for the majority of the Martagons resent being disturbed at the roots, and take two or three years to become re-established. This Lily thrives in a mixture of loam, peat, and sand, in which it will become quite established, and flower year after year. It is therefore suitable for cultivation in Rhododendron beds. The plants bloom generally early in July.

L. Martagon (Turk's Cap Lily) is closely related to the preceding species, but it is benefited by a greater proportion of loam in the soil. The colour, a kind of dull purplish pink, is not at all attractive, but the individual blooms are so symmetrical, and the contour of the whole spike so graceful that it is a general favourite. Two varieties—*album* (white) and *dalmaticum* (deep shining purple)—are among the most beautiful of all Lilies. The spikes of *L. Martagon* appear to be ideal subjects for use in a cut state to furnish large vases and for similar purposes, but in a confined space their strong perfume is disagreeable. Out of doors, however, *L. Martagon* is a delightful Lily.

L. longiflorum is represented in gardens by several forms, and it must be regarded as the most popular member of the genus. We draw our supplies from Japan, Bermuda, South Africa, the Canary Isles, and Holland. By far the greatest number comes from Japan, and the bulbs from that country are decidedly the best for planting out of doors. Being of lesser stature than many other Lilies, this species needs to be mixed with dwarf-growing shrubs, especially suitable for the purpose being many of the hardy Heaths.

L. pardalinum (the Panther Lily) is a native of California, and remarkable for its curious, creeping rhizome-like bulbs, a characteristic shared by a few other species from the North American continent. It is essentially peat-loving, and needs a fair amount of moisture, hence it is seen at its very best when associated with Rhododendrons and similar plants. The Panther Lily will reach a height of 6 feet to 9 feet, and bear 20 to 30 flowers on a stem. They are prettily reflexed, and disposed in an exceedingly graceful manner. In colour the flowers are bright orange, more or less spotted with red,

while the tips of the petals are scarlet. In some forms this colouring extends at least over one-half of each petal. One of the best varieties, and a vigorous grower is *L. p. californicum*.

L. testaceum is also known as *L. excelsum*, and cannot be confounded with any other Lily in cultivation, as the nankeen colour of the flowers is so distinct from all other Lilies. It will reach a height of 6 feet or more, and on this account the drooping flowers are seen to particular advantage. This species may be grown in a similar mixture of soil as is recommended for *L.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM REGIUM.

This species was shown for the first time in this country, at the meeting of the Royal Horticultural Society on the 6th inst., when plants in flower were displayed by Sir Trevor Lawrence and Messrs. Charlesworth & Co. The species is a native of Lower Hindustan, and was described by Lt.-Col. Prain, in 1902, in the *Journal of the Asiatic Society*

FIG. 46.—DENDROBIUM REGIUM; A RECENTLY INTRODUCED SPECIES FROM INDIA: SEPALS AND PETALS ROSE-COLOURED, LIP WHITE WITH A YELLOW DISC.

Hansonii, or in loam under such conditions as are favourable to *L. candidum*. However limited may be a selection of Lilies for outdoor culture, *L. testaceum* must on no account be omitted.

My article being already long, I will conclude with the remark that while flowers of such lilies as *Lilium auratum*, *L. chalcidonicum*, *L. giganteum*, *L. Henryi*, *L. superbum*, and *L. tigrinum*, may open in July, these species are more correctly described as August-flowering species. W.

(lxxi., p. 80); a plant flowered at Kew in 1904. The flowers have a general resemblance to those of *D. nobile*, but they are without the usual dark blotch that is present on the lip in the older species.

The largest flower measured 4 inches across its widest part, and the petals are much broader than those of *D. nobile*. The segments are a clear shade of rose; the base of the lip is white, with a yellow disc, while the pointed front portion is of the same colour as the petals and sepals, but of a deeper shade.

THE ORCHIDS OF THE NORTH-WESTERN HIMALAYA.

THIS valuable continuation of the *Annals of the Royal Botanic Garden, Calcutta*, forming Part II. of the 9th volume, is by Dr. J. F. Duthie, B.A., F.L.S., late Director, Botanical Department, Northern India. The plan of the work is best described by the author in his preface as follows:—

"The attempt here made to give an account of the Orchids of the Western Himalaya may be regarded as a supplement to the splendid work

Orchids of the region, together with a table showing the distribution of the different genera in other parts of the world. It appears that the number of species of Orchids at present known in the region dealt with is 173, 59 being epiphytes and 114 terrestrial species. They are included in 45 genera. Twenty-four species, some of which are described by the author as new, are not known to occur outside the area of the Western Himalaya, and the following 10 species extend to Britain: *Listera ovata*, *Corallorhiza innata*, *Goodyera repens*, *Spiranthes autumnalis*,

Mackinnonii, Duthie, and the singular leafless, parasitic *C. macrorhizon*; *Cypripedium* 1, *Dendrobium* 4, *Eria* 1, *Eulophia* 6, *Gastrodia* 1, *Goodyera* 2, *Habenaria* 18, *Hemipilia* 1, *Herminium* 4, *Liparis* 5, *Microstylis* 1, *Oberonia* 1, *Oreorchis* 2, *Pogonia* 3, and *Vanda* 1.

The work is printed by the Bengal Secretariat Press, Calcutta, and may be obtained in this country either with the plates uncoloured or half-coloured.

ONCIDIUM TRIQUETRUM.

AN inflorescence and leaf of this pretty species has been sent by Mr. J. Spiller, gardener to Dr. G. B. Longstaff, Highlands, Putney Heath, taken from a specimen which bloomed among plants collected by Dr. Longstaff in Jamaica last winter. It is a dwarf species, with equitant, fleshy, acutely three-angled leaves and a spray of flowers, each of which is 1 inch across. All the segments are red with a white margin, which is broadest in the petals, and the labellum is streaked with red. *O. triquetrum*, and others of its section, should be grown in small baskets or Orchid pans and suspended near the glass of the roof in an intermediate house, as the plant soon fails if placed on the stage with the larger and stronger-growing species.

ONCIDIUM LURIDUM GUTTATUM.

THE superior beauty of the Jamaica form of this variable species, and which goes far towards entitling it to rank as a distinct type, if not a different species, is well shown in a few sprays sent by Mr. J. Spiller. The species, which has large fleshy leaves, is widely distributed in tropical America, the varieties generally having a straggling inflorescence and the flowers a large proportion of dull brown colour. The Jamaica form has light green leaves spotted with dark green, a much-branched inflorescence, and well-formed yellow flowers spotted with red-brown, the labellum being lightest in colour. The column is white, and the crest yellow and rose-coloured. *J. O'B.*

ITEA ILICIFOLIA.

ON page 375 of the *Gardeners' Chronicle* for November 28, 1903 (vol. xxxiv.), appeared a figure of a spray of this plant, which flowered at Kew in 1903 for the first time. The text described the raceme of flowers as being about 4 inches in length. The same plant was recently in flower in the Himalayan House at Kew, and this year some of the racemes were quite 1 foot in length, drooping from the end of the branches—not rigid, as shown in the figure quoted.

Judging by the dried specimens collected by E. H. Wilson, for Messrs. Veitch, in the neighbourhood of Ichang, Central China, a foot seems to be the normal length of the flower raceme in the wild state.

Itea ilicifolia is an evergreen shrub, native to Central China, and was first collected by Dr. A. Henry, from whose material it was figured and described in Hooker's *Icones Plantarum*, t. 1538. Found in glens or on exposed cliffs in its native country, it is said to attain a height of from 2 to 18 feet, according to the situation.

The leaves, from $2\frac{1}{2}$ to 3 inches long by $1\frac{1}{4}$ to 2 inches broad, are broadly elliptic in outline, with sinuate spinescent margins, and so closely resemble those of a Holly that, out of flower, one might easily mistake the plant for a species of *Ilex*. The numerous small, greenish-white flowers are almost sessile along the length of the raceme, and suggestive of those of the better-known *Itea virginica*, a deciduous species from North America, hitherto the only representative of the genus in cultivation.

Three other species, namely, *I. chinensis*, *I. parviflora*, and *I. yunnanensis*, are recorded from China, but these do not appear to have been introduced into cultivation. *Itea ilicifolia* seems to have been first cultivated in this country by Lord Kesteven, for on p. 504 of the

(Photograph by E. J. Wallis.

FIG. 47.—ITEA ILICIFOLIA FLOWERING RECENTLY AT KEW: FLOWERS WHITE.

by Sir George King and Mr. R. Pantling on the *Orchids of the Sikkim Himalaya*, which was published in 1898 as Vol. VIII. of the *Annals of the Royal Botanic Garden, Calcutta*. With Sir Joseph Hooker's monograph of the *Orchids of British India* as a basis, and Sir George King's as a model for a local Orchid-flora, the preparation of the present contribution has been very greatly facilitated."

The introduction gives particulars of the Western Himalaya and the distribution of the

Epipogon aphyllum, *Epipactis latifolia*, *Cephalanthera ensifolia*, *Orchis latifolia*, *Herminium Monorchis*, and *Habenaria viridis*.

The desire being to avoid again illustrating the showier species already figured in the *Orchids of the Sikkim Himalaya*, but few of the species so carefully illustrated in the 58 plates of the present work are of that character, and the subjects are principally terrestrial species. The genera illustrated are: *Aphyllorchis* 1, *Calanthe* 3, *Cirrhopetalum* 1, *Cymbidium* 2 (*C.*

volume of the *Gardeners' Chronicle* already quoted, his lordship wrote that he raised plants from seeds sent by Dr. Henry from China, and had grown them in the open in Lincolnshire, in a position protected on the north and east by other shrubs, for at least 14 years prior to the date of its recorded flowering at Kew.

In the south-west of England it would probably prove hardy, and if afforded the protection of a wall might succeed out-of-doors in some gardens in less favoured localities. *H. Spooner.*

HARDY AQUATIC AND WATERSIDE PLANTS.

A LAKE or pond, and even a simple water-course, can be made objects of much beauty when planted with a selection of water plants.

A small portion around the margin should be set apart for planting bog-loving plants: these should not be kept trim, but should be allowed to grow nearly wild, with only such pruning and clipping as are necessary to keep one plant from smothering its neighbour. Among the many beautiful plants that will grow in water is the floating *Aponogeton distachyon*. Its flowers are pure white, and waxy in appearance, with a pleasant scent resembling that of the common Hawthorn. Although a native of the Cape of Good Hope, it thrives in this country, and, when once thoroughly established in moderately deep water, reproduces itself freely from seeds. If a supply of plants be quickly needed, the seeds should be sown in a tank in a warm greenhouse, where, in a very short time, an abundance of plants may be raised, and afterwards hardened and planted out.

The large, flat, floating leaves of *Nymphaea alba* present a stately appearance on the water. In planting new crowns some good fibrous turves should be secured to its roots to cause the plant to sink in the water. I find this a much better plan than the use of sunk baskets.

Richardia africana is usually grown as a pot plant, but it is equally serviceable for planting in water, where it will survive as much as 18° of frost. Plants in these gardens are flourishing well in water, and prove the most handsome of all aquatics, as their foliage and inflorescence stand up well, and appear charming viewed from a distance. Another pleasing aquatic plant is *Acorus Calamus*, the Sweet Flag. Both the stems and the leaves give off a very beautiful perfume when they are rubbed. Another native plant, *Butomus umbellatus*, the flowering Rush, forms a very handsome subject for the water-garden. It has linear leaves and large umbels of rosy-pink flowers produced on peduncles from 3 to 4 feet high. The large, arrow-shaped leaves of *Sagittaria sagittifolia* form a fine clump that is crowned in summer with white flowers. *Menyanthes trifoliata* has creeping stems, and in the early part of the season produces large racemose heads of pretty, white flowers, which are exceedingly handsome when closely inspected.

Caltha palustris and its improved forms produce quantities of bright yellow flowers early in the year. *C. p. polypetala* is one of these improved forms. It has much larger leaves and flowers than the type plant.

Calla palustris is a small miniature Arum, with white flowers that are borne not more than 6 to 9 inches above the water. Rats are very fond of this plant.

Other suitable plants for water planting are:—*Orontium aquaticum*: this produces bright-golden flowers in early summer. *Ranunculus lingua*, a large, showy, yellow-flowered species, rising about 18 inches above the water. *Typha angustifolia*, the long-leaved Cat's Tail. *Peltandra virginica*, the Water Arum: this plant has large, arrow-shaped foliage and a white spadix; it is very handsome when seen in bold clumps. *Valisneria spiralis*, with long leaves and small, white flowers; *Rumex hydrolapathum*, the Giant

Waterdock. *Scirpus lacustris*, and *Zizania aquatica*, the Rice plant.

Amongst the best plants that will succeed on the banks of lakes and streams are several species of *Carex*, including *C. pendula*, a very graceful and ornamental plant; *C. Greyii*, an upright-growing species, with yellowish-green apical flowers; and *C. japonica*. These sedges should all be plentifully planted along the banks of streams and ponds, where they form very graceful and effective objects.

Lythrum roseum superbum has bright, rosy-red flowers, and is a very showy subject. *Spiraea palmata* is a plant which grows rapidly and soon makes a big clump, and flowers profusely. It reaches a height of from 3 to 4 feet, and its season of flowering is July. *S. gigantea* is a large species that produces big, white plumes of flowers, the inflorescences sometimes measuring 8 or 9 feet in height. It flowers in July and August. *S. Davidii* is one of the newer *Spiræas*. Plants at Leonardslee have reached a height of from 3 to 4 feet this season. They flower in August. *Hemerocallis* in variety flourish well in damp situations, and their flowers make a very fine blaze of colour. Both *Mimulus cardinalis* and *M. lutea* are charming subjects for the waterside. *Funkias*, especially *F. Sieboldi*, make large clumps on the banks of ponds or in any other moist place. The large leaves of *Gunnera manicata* form a distinct feature. The plants require protecting with some dry material during the winter and spring months. The protective material should be of a very light nature, so that it can be lifted up by the leaves as they develop. All flowering shoots should be removed as they appear. The leaves reach a much larger size when the plants are uninjured by frost.

Gunnera scabra, often known as *G. manicata*, is not of such robust growth as the true *G. manicata*. Other species of *Gunnera* are *G. magellanica*, a plant with small leaves, and *G. monoica*, a still smaller plant.

Among showy flowering plants are the varieties of *Iris Kämpferi*: *Pinguicula grandiflora* has pretty dark blue coloured flowers, which appear in spring time; *Petasites gigantea* has leaves from 2 to 3 feet wide, and the same measurement in height. *Saxifraga peltata* flowers early in the season, after which the handsome foliage develops. This plant should be given some good rich material at its roots. *Polygonum sachalinense* grows from 8 to 10 feet in height in favoured situations and is a very handsome subject. *Rodgersia podophylla* is a fine foliage and flowering plant, with large peltate leaves, which assume a bronze colour. *Primula japonica* succeeds well on the banks, and also partly in the water. In a season or two this plant reproduces itself in immense numbers. *Primula rosea* succeeds when grown on large stones in the water. *Primula sikkimensis*, a yellow species, will also grow in a similar position in a sheltered spot. *Sarracenia purpurea* is always an interesting plant. It will flower freely in a position that is fully exposed to the sun. *Darlingtonia californica* needs the same treatment as *Sarracenia*; and both plants should be afforded a dressing of sphagnum-moss over their roots. *Crinum capense* flowers and flourishes splendidly in a bog.

Among other plants may be mentioned Ferns, including *Lastrea Thelypteris* (Marsh Fern); *Onoclea sensibilis*; *Struthiopteris japonica*; *S. pennsylvanica*, a very pretty plant. All the species of *Osmunda* are particularly fine subjects for the bank in low places near to the water. Other good subjects are *Parnassia palustris* and its varieties. *Polyanthus* in variety, *Myosotis*, *Lilium pardalinum*, *L. superbum*, *Lysimachias*, *Glycerium argenteum* (Pampas Grass), *Bambusa Metake*, *Phyllostachys viridi glaucescens*, and *Rhododendrons*.

Many of these plants require high feeding to produce the best results, and this is best done by top-dressing. Lilies, Irises, *Spiræas*, and

many other plants should be afforded manure several times during their growing season.

Rustic bridges which span the water should be covered with climbing plants, such as *Wistarias*, *Jasmines*, *Loniceras*, *Rambling Roses*, *Nasturtium speciosum*, *Clematis montana*, and *Asparagus acutifolius*. The plants are best when they are allowed to grow loosely, and are only secured sufficiently to keep them in their proper position. *W. A. Cook, Leonardslee Gardens, Horsham, Sussex.*

TREES AND SHRUBS.

POPULUS CANESCENS.

THIS variety, a cross between the Silver Poplar (*Populus alba*) and the Aspen (*P. tremula*), is of interest to the botanist for the various transition forms observable in the leaves. As a forest tree, *P. canescens* is one of the most valuable owing to its resistance to the wind, it being in this respect superior to *P. alba*, and for the landscape gardener its vigorous and open habit of growth in the crown is not without interest. The foliage is of a greyish-green tint, and of larger size than that of either parent, and bears a certain resemblance to *P. nigra*, as likewise does the form and build of the crown in old examples. The colour of the bark is greyish-brown, somewhat resembling *P. alba*. *F. M.*

BUDDLEIA COLVILEI.

It may be interesting to record that a plant of *Buddleia Colvillei* has flowered for two years in succession in Lady Fowler's garden at Inverbroom, in the north-west of Ross-shire. It has, however, not formed inflorescences on the axillary shoots, as mentioned by Mr. Winter on p. 26. The specimen is trained against a wall that faces west, where it has withstood 24° of frost, but I am of the same opinion as Mr. W. E. Gumbleton (p. 54) that the species is not hardy, and that a few more degrees of frost would cut it down very badly, or even kill it.

STYRAX JAPONICA.

I WAS much interested in the article by Mr. Cook on "Choice Shrubs at Leonardslee Gardens," and more especially with his remarks on *Styrax japonica*, *Stuartia pseudo-camellia*, and *Cæsalpinia japonica*. Mr. Cook states the size of the *Styrax*, but does not afford the information as to the age of the tree when it first flowered. A young specimen was planted in these gardens last spring, with others of *Buddleia alba* flora, *Crinodendron Hookeri*, *Carpenteria californica*, *Photinia arbutifolia*, *Olearia stellulata* or *Gunnii*, and *Ceanothus Gloire de Versailles*, and all, save the *Styrax*, have either flowered or are about to do so, and in no case is a plant more than 2 feet high, *Olearia stellulata* being only 1 foot high. *Davidia involucrata*, *Eucryphia pinnatifolia*, and *Abutilon vitifolium*, also planted at the same time, show no signs of flowering. *Harry Low, Braemar Gardens, Garve, Ross-shire.*

VEGETABLES.

CABBAGE LETTUCE TREMONT.

FOR late sowing this variety is largely grown in Switzerland, but seldom in any of the neighbouring countries. It stands the weather uncommonly well, and, in spite of this fact, it has large, tender heads, much liked as a market variety. The leaves are red-edged and spotted. For winter supply the seed is sown at the end of the month of July, and, at the latest, at the beginning of August. With some kind of protection by means of boards at the sides of the bed, and a covering of mats, or brushwood, or straw laid on these, heads can be cut as late as Christmas-tide, the plant enduring a certain degree of frost uninjured. *F.*

THE FERNERY.

A NEW LADY FERN.

(*ATHYRIUM FILIX FEMINA KALOTHRIX CRISTATUM*.)

THE "Kalothrix" or "beautiful hair" variety of the Lady Fern is unique, since not merely are the normal divisions of the frond reduced symmetrically to slender threads, but these are peculiarly transparent and have a shining, silky surface such as no other variety possesses. Its origin is somewhat mysterious, since it originated with two raisers about 1870, assumably from the spores of a plumose Lady Fern in the Oxford botanic gardens at that date. There exists, however, a herbarium specimen of a frond of a precisely similar form found wild on

in which the fronds and their divisions consist of longer but far fewer hairlike sub-divisions set widely apart.

Until recently, and despite the fact that the Fern has been freely raised from spores ever since it was discovered, no tasselled form has been noticed. Notwithstanding, this was attempted by myself some years ago by crossing it with finely-crested forms, the only result was to get slenderer-crested Ferns of the coarse-surfaced type. Three years ago I sowed spores of my plumose strain of *A. f. f.* "superbum" in a small thumb pot. The sowing went wrong, the little pot developed a few spores only, and, room being needed, it was lifted out to be thrown away when a minute little clump of clustered mossy-looking frondlets attracted attention. I discovered that no fewer than seven young

is perhaps the most noteworthy. In any case, two points are very remarkable, the one that so beautiful a form should be obtained by such an accident, and the other that so many plants should originate from a single prothallus. *Chas. T. Drury, V.M.H., F.L.S.*

NURSERY NOTES.

ANNUALS AT READING.

I RECENTLY inspected a very comprehensive trial of annuals, including an exhaustive one of Sweet Peas, in the nursery of Messrs. Sutton & Sons, Reading. The actual number of varieties on trial was 461, contained in 1,016 rows, having a total length of 2½ miles. The arrange-

FIG. 48.—A GROUP OF HARDY NYMPHÆAS AND OTHER WATER-PLANTS EXHIBITED BY LEOPOLD DE ROTHSCHILD, ESQ., AT THE MEETING OF THE R.H.S. ON AUGUST 6 LAST. (See page 115 in the last issue.)

[Photograph by E. J. Wallis

the Mourne Mountains in Ireland many years previously, but there are no records of its subsequent cultivation. That the form now existent was derived independently from a merely plumose type is largely evidenced by the fact that not only does *Kalothrix* partially revert and produce the coarser parental divisions and even entire fronds of a coarser type among a far larger proportion of the true form, but if its spores be sown, the crop is almost invariably of two kinds, viz., true *Kalothrix* and true plumosums, the latter strongly resembling *A. f. f.* *plumosum* Horsfall, but known as *A. f. f.* *p. Stansfieldii*. The qualification almost is only justified by the fact that two sub-varieties have been raised, viz., *A. f. f. k. foliosum*, with wider but still silky divisions, and *A. f. f. k. linearis*,

Ferns had sprung from one prothallus. These were severed, and I thus obtained seven tiny plants, each with its own rootlet. As they developed, the *Kalothrix* silkiness appeared. I have now six beautifully-tasselled plants of the *Kalothrix* type. It is, of course, a matter of doubt whether these arose from the spores of *superbum* actually sown or from a stray spore of *Kalothrix* which, by crossing, acquired the *superbum* faculty of cresting. This latter theory seems the more probable, since in one of the plants part of one of the pinnae shows distinctly that tendency to partial reversion which is peculiar to *Kalothrix*; on the contrary, if they have resulted from crossing it is extraordinary that all the seven archegonia should have been fertilised by similar antherozoids. This last fact

ment of the varieties in groups according to colour, is one that finds favour with the visitor, and by this means one or a dozen varieties of a similar colour can be compared at a glance. Superior and inferior stocks could be singled out with the same ease. In the case of all great seed firms, a trial for comparison becomes imperative each year. This is especially necessary in the case of Sweet Peas. In the large collection of Sweet Peas at Reading, some varieties are much superior to others, and in white-flowered sorts Messrs. Sutton's Giant-flowered White is conspicuous. Nora Unwin, which may be regarded as the Countess Spencer form of Dorothy Eckford, is also a very fine white variety. In the pink-flowered sorts, Queen of Pinks was noticed

by reason of the pure salmon-pink tint of its petals, the size of the blossoms, and their refined character. Miss Willmott, Bolton's Pink, and Orange Prince (a conspicuous shade) are other excellent varieties. Among the flowers with a more pronounced red shade, King Edward VII., Queen Alexandra, John Ingman, Her Majesty (one of the largest flowered varieties, with bright rose standards and pale rose wings), Salopian, Evelyn Byatt, and Helen Lewis were all good. In pink and red-flaked sorts, Aurora, a salmon-pink on white ground, is most effective; while in the delicate rose and pale pink shades, Gladys Unwin, Countess Spencer, Dainty, and Mrs. Alfred Watkins are leading sorts.

Of cream and yellow varieties Hon. Mrs. E. Kenyon, Queen Victoria, Jeannie Gordon (a dainty flower in cream and rose), and Primrose Queen are all good. Mrs. H. Kendall Barnes and Dora Breadmore are of the cream ground class, with a tinge of pink or other shade. Among the flowers of a blue shade I noted Flora Norton, Mrs. G. Higginson, Jun., Frank Dolby (frilled, pale mauve), Mrs. Walter Wright (mauve, fine of form), and other well-known sorts, including Lady Grisel Hamilton, Countess of Radnor, &c. Sutton's Butterfly, a pure white flower, edged with lavender-blue, was also noted as a beautiful and distinct variety. Brilliant Blue, also known as Lord Nelson, is a fine deep blue, excellent in form and colour. Quite one of the best of Messrs. Sutton's novelties for the year is named "Our Queen." It is of true Spencer form, and is a suffusion of pale pink on a cream ground. An interesting feature in the Sweet Pea trials was a portion devoted to colour mixtures. That is to say, a proportionate—not an indiscriminate—mixture, in which varieties of certain colours only were blended. Some of the more conspicuous of these mixtures were composed of the following colours:—Cream and maroon; cream and pale blue; rose and pale blue; red, white, and blue; pink, yellow, and salmon; and salmon-pink and scarlet.

Apart from the trial of Sweet Peas were to be seen others of Godetias, Clarkias, Nasturtiums, Stocks of many shades and types, brilliant Eschscholtzias, Linums, and annual Chrysanthemums. Of the last-named plants the improved forms of *C. segetum grandiflorum*, known as Morning Star and Evening Star, are acquisitions. *Saponaria vaccaria* is a good pink-flowered plant, and valuable for bedding or for supplying cut flowers. The large-flowered forms of the Sweet Sultan always attract attention, the mauve and white colours of the flowers being very attractive. *Schizanthus*, sown in the open air in April, was an unqualified success. The "compacta" strain of *Nemesia* now embraces almost every shade of colour, with blossoms of the largest size. In Sweet Williams, the brilliant pink and scarlet-flowered varieties appear to be well-nigh perfection in their respective shades. Not least among the choice plants is a Foxglove named Primrose Perfection, with flowers a soft chrome yellow, and with faint spottings on the throat. E. J.

COLONIAL NOTES.

HORTICULTURE IN WESTERN CANADA.

THE largest and most up-to-date greenhouses in Canada, west of Toronto, are situated in the city of Edmonton, in the north-west. This fact is something to be proud of, for the city 10 years ago was but a trading post, and even the western Gotham-Winnipeg has not such large or well-equipped greenhouses as those belonging to the firm of Ramsay.

There are six plant-houses in all, built on the ridge and furrow principle, and each contains two beds, 150 feet long by 5 feet wide. By next winter the ground space will be exactly

doubled, for there will then be a total of 24 beds of this size.

The system of ventilation, both in summer and in winter, is as perfect as possible. The water for the plants is carried in pipes along each house; 1½ miles of 2-inch steel pipes form part of an efficient steam-heating apparatus. Last winter, the coldest on record, 400 tons of coal were required to keep the houses at a proper temperature. In summer time as evening approaches, and the heat of a June sun moderates, these greenhouses form a pleasant place to saunter through. At the entrance, a bed of tall Palms and Ferns are massed in their cool greenery, and the eye afterwards encounters beds of Roses. Our season of Roses is when the prairies of the west are all a-bloom in July with the delicious wild Rose. One long bed is filled with the pure white and the pink varieties Bride and Bridesmaid, and for these varieties there is a constant demand all the year round. One sturdy-stemmed, thorny Rose, with blooms of a deep carmine shade, is appropriately called General McArthur. Still newer is Richmond, a southern-raised flower with full, loose, red petals that are most attractive when in the bud stage. American Beauty is a long-stemmed, smooth-foliaged, and luxuriant-growing Rose, and near at hand is planted the old-fashioned Perle du Jardin, a softly tinted, yellow Tea variety.

There is not seen in the whole assemblage of blooms one of a more subtle charm than Canadian Queen. This is pure white or pearl at the centre, but its unfolding petals are tinged with a deep pink shade. It has something of the character of the wild prairie Rose in its free arrangement of petals. Second only in popularity to the Roses are the flowers in the next house, the Carnations. The clear shell-pink petals of Enchantress are most beautiful; in the next bed are white varieties, including Glacier, Queen Louise, and Boston Market. Marquis, growing close to these, has something of the charm of colouring seen in Canadian Queen; in addition, it has a delightful fragrance. Others grown are Estelle (scarlet) and President Roosevelt (rich, deep red). This flower, used with *Lilium Harrisii*, is excellent for the making of bouquets. Sweet Peas also do well here, and plants from a sowing made last September have been blooming profusely since January. Little less important than the cultivation of flowers is the provision of greenery, essential for the artistic arrangement of bouquets, and a quarter is devoted to the culture of Smilax and Ferns. Tall Palms of many varieties, Rubber plants, and a fine array of other foliage plants find a place here. One entire house has this year been devoted to Chrysanthemums, and over 3,000 stocky young plants are seen. This flower is a favourite at Edmonton, as elsewhere, and the supply last year was not equal to the demand, but this year increased space has been given to the cultivation of Chrysanthemums. At several spots in these plant-houses, the eye meets a group of old-fashioned scarlet Pelargoniums. These are in many varieties, with both double and semi-double flowers of many colours. Edmonton has not yet reached the stage where universal attention is paid to the care of its lawn and gardens, and this year the late spring militated greatly against the beautifying of gardens. However, the greenhouses supplied many plants for beds and baskets, the greatest demand being for Pansies, Asters, Stocks, Petunias, Verbenas, Daisies, Pelargoniums, and Phloxes. There was no demand for Cannas, and but little for Coleus. Ageratum is a favourite border plant in summer. Among other plants grown in this district are Nasturtiums, with flowers of orange, tawny and scarlet colours, and the old-fashioned Musk. Next winter greater attention will be given to the raising of Tomatoes, Lettuce, and other vegetables, for the supply of last winter was not suffi-

cient to meet the demand. Fresh propagating beds are being added, another "Florence" boiler is being installed, and the heating capacity of the present plant will be doubled. Next winter the houses will cover an area of about 2 acres. C. F. Clark, 343, Tenth Street, Edmonton, Alberta, July, 1907.

THE HARDY FLOWER BORDER.

CAMPANULA GRANDIS.

(SYN. C. LATIFOLIA.)

WITH the present desire for novelty, it not infrequently happens that the merits of old-fashioned plants are overlooked, and I think this is true of the above-named Campanula, which is one of the showiest border plants in flower at the present time. Usually it attains to a height of about 3 feet, but considerably more if liberally treated, and where the soil is rather moist and deep. It is erect-growing and self-supporting, and produces long, columnar spikes of closely-set, somewhat salver-shaped blossoms that are of an intensely deep violet-blue colour. It is probably one of the most accommodating of good border Bell-flowers, and is readily distinguished from the peach-leaved Bell-flowers by its dense ground-covering of lance-shaped leaves, the leading tufts of which form themselves into huge rosettes. The plant is of vigorous growth and easy of culture. Its density of growth demands a periodical transplanting, and the reducing of much of its shoots. This Campanula forms a splendid border plant for a chalky soil, but it will succeed on very light soils. I recently saw in the herbaceous border at the Horticultural College, Swanley, a group of plants several feet across. The flowers were beautiful even when seen at a great distance, and the display of blossoms will probably continue for some time to come.

CAMPANULA VAN HOUTTEI.

THIS variety is placed in the Kew *Hand-List* under the name of *C. latifolia*, but I think there is much evidence in support of its being a hybrid, with possibly *C. latifolia* as one of the parents. The leaf and more slender stem growth have nothing in common with the species named, much less has the stoloniferous habit of the plant, a characteristic which partakes more closely of the habit of *C. punctata*. If, in addition to these things, the time of flowering is considered, there is, I think, far greater evidence of varietal relationship to the latter than the former species. But, whatever its origin, the plant is a valuable addition to the garden, and the pale lavender-blue of the large pendent bells renders it a welcome subject in the early summer time. It will not admit of massing if its slender grace and beauty are to be seen to the best advantage. In soils of a light texture the stolons ramify rather freely, but less so in heavy soils. In the case of very heavy soil a free addition of leaf soil, spent mushroom-bed manure, or even cocoa-nut fibre about the roots at planting time will be of assistance in promoting an early growth. Established plants may be planted at any time, but ground plants are best planted in spring. E. H.

CAMPANULA ROTUNDIFOLIA VAR. ALASKANA.

I RECEIVED a plant last year under this name from Herr Max Leichtlin, but it has not proved distinct from some of the forms of *C. rotundifolia* already in cultivation. It is somewhat dwarfer than the variety of *C. rotundifolia* called pallida, but the large bells are of much the same shade of light blue. The many varieties of the common Harebell are worthy subjects for the hardy flower border, and amongst the best is *C. rotundifolia pallida*. S. A.

CAMPANULA ROTUNDIFOLIA VAR. ALPINA.

THIS plant is often sold as *Campanula alpina*, but it is entirely distinct from that species, and is much easier of cultivation than the true *C. alpina*. It is one of the prettiest of the dwarf-growing Harebells, and has long been in cultivation. The very dark flowers produced on stems about 9 inches in height contrast well with the white downy stems. Maund figured the plant under notice as *C. alpina*, but the error was corrected by the late Mr. J. C. Niven, of Hull.

ANEMONE ELONGATA.

THIS windflower, which I acquired last year for the first time, is now in bloom in my garden, but it is greatly inferior to many *Anemones* already in cultivation. It has a broad general resemblance to *Anemone sylvestris*, but there can be no real comparison between the latter beautiful species and the Himalayan one, for *A. elongata* is much the inferior of the two. The foliage is rather like that of *A. sylvestris*, but it is of more irregular outline, and larger and slightly lighter in colour. Only one of my plants has flowered, and this has developed a flower stem bearing, about a third up, where it forks, a few leaves. Thence the taller of the two stalks rises without any leaves to a total height of 20 inches from the soil. The other stalk has a tuft of leaves about half-way up, and is about 16 inches high. The flowers, which are erect, are $\frac{2}{3}$ -inch across, and are of a dull, greenish white. The anthers are bright green. There is nothing about the plant to commend it for planting in gardens. S. Arnott, Sunnymead, Dumfries.

SALVIA ARGENTEA.

THIS species is one of the most beautiful of the genus. The plant grows about 3 feet in height, is of a free branching habit, and produces numerous sprays of large pure white flowers in June and July. The foliage, however, is its most distinctive feature, for the leaves are broad and silvery and they show to advantage in the herbaceous border or in the Alpine garden. The species is very hardy, and can be grown in a light, well-drained soil without difficulty. W. G., Somerset.

NOTICES OF BOOKS.

BEES FOR PLEASURE AND PROFIT.*

A BOOK to be of real value to the beginner in any art must be written in simple, and, at the same time, plain language; further, it should be arranged in logical order, and its different subdivisions clearly set out so that it may form a handy book of reference. The work under notice fulfils these conditions, and can therefore with confidence be recommended to persons about to embark on bee-keeping as a hobby or for profit.

It is a fascinating book and one of interest from cover to cover. The writer, in his preface, claims that the work is free from unnecessary verbosity, and this statement is certainly a true one. The book has the stamp of practical experience on every page, and it should be especially welcome at a time when the question of "small holdings" is uppermost, for, with the development of "small holdings," fruit culture will receive more and more attention, and the work performed by bees in a fruit plantation is valuable.

The illustrations are very good, but one cannot but be sorry that the picture of a comb stored with honey and brood (fig. 4) was not reproduced from a photograph.

Fully ripened honey, that is honey from sealed cells, is the best for extraction, and is superior to that from the honey ripener, particulars of which

are given on p. 49. The additional chapter on "Bee-keeping in Hot Climates" will be useful to our Colonial kinsmen, and also to those persons about to emigrate.

This little treatise will also be of value to those who have made some advance in the art of bee-keeping, no less than to the beginner, and to these the pages on "Queen Raising" and "Queen Introduction" will prove of great interest. *Chloris*.

ECONOMIC ZOOLOGY.*

No better evidence can be adduced of the growing interest in Economic Zoology than in the support which has been given to it by the County Councils of Surrey and Kent. They have materially advanced this branch of natural science by furnishing the necessary means for the annual publication of such valuable reports as the one which has just been issued from the South-Eastern Agricultural College at Wye, Kent.

We find this report a worthy companion of those which have preceded it, and the author's name is a guarantee of the thoroughness both of the practical and scientific portions of the work. It affords at once a work easy enough for the professional, and if not quite full enough is precise enough to form an excellent text book on the subject.

We gather from a perusal of its pages that numerous experiments have been carried out with insecticides, "partly in conjunction with Mr. Spencer Pickering, who has kindly supplied the various washes that he has worked with." While efficiency is claimed for many of the "washes" no satisfactory results are recorded concerning the destruction of the eggs of insects peculiar to various fruit trees during the winter months. "But the large series of experiments being carried out in Worcestershire under the auspices of the County Council by Mr. Kenneth Farley, and similar ones carried out by many growers in Kent and Surrey, may yield some definite results. The greatest success so far has been obtained by the use of lime and salt . . . but the matter requires further work yet to find out what is best to add so as to increase its adhesive power."

We fear that it has long been a standing reproach to the Economic Entomologists of this county that they have not yet succeeded in discovering an effective remedy for the Currant bud-mite or "big bud." Twenty years ago carbolic acid was claimed as a remedy, but this proved more harmful to the plants than the destructive work of the mites. Since that time a number of equally useless methods have been claimed as a means of checking or destroying this pest; prominent among these were the "hot water cure" and fumigation with hydrocyanic acid gas. The numerous and almost exhaustive experiments conducted by Mr. Spencer Pickering¹ at the Duke of Bedford's Fruit Farm, Woburn, and continued over a number of years have, we believe, so far failed to offer any hope of a remedy for this pest. Mr. Collinge², however, in the *Journal of the Board of Agriculture*, at the beginning of the present year claims to have discovered by the application of lime and sulphur "a practical and effective cure, which can be easily applied at a relatively small cost." Theobald in his report states that Collinge's method "has been carried out for two seasons on some bushes (20), and this year the big-bud is worse than ever. The bushes were not dusted as Mr. Collinge suggests, three times, but last year 13 times." The writer of this review has not had the opportunity of putting Mr. Collinge's method to a practical test, and is therefore not in a position to discuss the question; but

in the light of Mr. Theobald's statement the newly-claimed remedy does not, unfortunately, inspire much confidence. The time is young yet, however, and we must patiently await the next season's results, which should definitely settle the question; meanwhile we hope that this latest discovered remedy will be put to the test by fruit-growers, and that it will meet with that success to which the author has, on his own showing, justly laid claim.

One of the most instructive portions of this report is that devoted to the woolly aphids. It has been conclusively proved that the damage done by the root form of this pest is much more severe and more widely distributed than was generally supposed. In view of this fact Mr. Theobald attributes the failures to destroy mealy bug to having hitherto ignored the presence of the migrating ground form. For winter washing the "old caustic alkali wash or the more improved Woburn wash" is recommended, and for the root form the injection of bi-sulphide of carbon.

Altogether 119 pests are dealt with, chiefly under the following heads:—Those injurious to man's domesticated animals, to fruit trees, corn, root crops, to pulse, hops and vegetables, flowers, forest trees, food-stuffs, and those causing annoyance to man. These headings will give a good idea of the scope of the work which, collectively, forms a valuable help towards the consideration of our present knowledge of Economic Zoology.

INSECT HUNTER'S COMPANION.*

THE instructions offered in this useful little guide will undoubtedly serve to initiate or to stimulate the study of insect life and lead to a successful pursuit of entomology. It contains the result of many years' experience both of the author and his collaborators; and though it is intended in the main for the naturalist who wishes to know where to collect and how to rear insects, also the method of preserving them for the cabinet, the young horticulturist or agriculturist who is undergoing a scientific training in these subjects will also find in its pages many valuable hints.

Mr. Farn is to be congratulated on the re-issue of a work which will prove, as the previous editions have already done, useful alike both in the field and study. R. N.

PLANT NOTE.

MELALEUCA HYPERICIFOLIA, &c.

WE lose much beauty in the garden and greenhouse by discarding the New Holland plants that were prized in the middle of the last century, and are as easy to grow into good specimens and to flower well, as tuberous-rooted Begonias and American Carnations. The *Melaleucas* have sessile flowers, produced on long clusters. *M. hypericifolia* has flowers of dull rose colour; *M. fulgens* is more showy, and is much branched and erect in growth, the colour of the flowers being light red. These and many other New Holland (Australian) hard-wooded plants grow readily in a mixture of hard peat one-third, light loam one-third, and leaf-mould one-third, with a free admixture of sharp sand. Re-potting should be performed in April, using a wooden rammer in making the soil moderately firm. The drainage should be good, but not excessive. From June 1 till September 30 the plants are the better for being placed out-of-doors in a fairly sunny aspect, and syringed at about 5 p.m., if the day has been bright. It is best to plunge the pots in coal ashes or coarse gravel. J. H.

The Week's Work.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq.,
Eastwell Park, Kent.

Perpetual-flowering Carnations.—Tie the shoots to stakes as required. Discontinue the pinching of the points out of the shoots of plants which are expected to flower in winter. The best stakes for supporting Carnations are those prepared from Bamboo points and dyed green; they are easily obtainable from the sundriesmen. These stakes are capable of lasting for a considerable time, and they always look neat. Syringe the plants occasionally with weak, clear soot water, this being very beneficial to the plants and of use in keeping down insect pests. The new strain of tree Carnations is proving more and more valuable, and there appears to be scarcely any limit to the flowering capacity of the plants. A batch we commenced to cut flowers from last October is, at the present time, bearing a free crop of flowers of good quality, and there is every appearance of further flower buds forming. The cultivation does not present any serious difficulty. Inexperienced cultivators sometimes

work, glass and stages, and afterwards sponge or spray the plants with a safe insecticide. In sponging such plants as *Codiaeums*, *Pandanus*, *Aralias*, and similar species with brittle foliage, extra care must be taken not to break or twist the leaves; the effect of such twisting may not be noticeable for some days afterwards, but it will eventually cause great disfigurement.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow,
Cornwall.

Narcissus.—Every three or four years the bulbs of the various species and varieties of *Narcissus* should be lifted, sorted, and re-planted. A change of soil is desirable, but if this is not possible, then extra care should be taken to plant only the very best and healthiest bulbs. Bulbs of second quality should be planted in vacant spots in the wild garden, or in the shrubbery. Some good bulbs of early varieties, including the single and double Lent Lilies—*N. Pseudo-Narcissus plenus*—and the *Polyanthus Narcissus*—*N. Tazetta*—should be planted on a warm, sunny bank to supply the earliest flowers.

Noisette and *Tea* varieties should be removed, and any shoot of undue length cut back to the level of the other growths. The ground is so wet from the rains that applications of liquid manure are inadvisable, and any feeding that may be needed is, under these conditions, best furnished by light dressings of some artificial manure. The budding of *Roses* should now be almost finished, but any long, ripened shoots near to the ground may be layered by cutting a notch in the underside of the shoot and pegging it into the soil. Cuttings of ripened shoots may either be rooted in pots on a hot-bed, or beneath a handlight in the sandy soil of a border. In both cases shading is necessary.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

French Beans and Butter Beans.—Sowings may be made of these useful vegetables. Select a warm position, and sow the seeds in lines arranged in such a manner that they may have frames or lights placed over them later in the

FIG. 49.—CARNATIONS NOW FLOWERING AT EASTWELL PARK, KENT.
(See "Plants Under Glass.")

[Photograph by D'ath.]

make a mistake in "coddling" the plants in winter. At that season plenty of fresh air is necessary to keep the plants healthy.

Souvenir de la Malmaison Carnations.—The one-year-old plants now passing out of flower should be re-potted, giving each a fairly good shift, according to the strength of the plant. Make the soil very firm, and use a similar compost to that advised in the calendar published in the issue for March 22. After the re-potting has been carried out, place the plants in a well-ventilated house or frame, or in favourable localities they may be placed out-of-doors; but on no account allow the plants to become saturated by continuous heavy rains, or trouble may be expected in the following winter. [If the weather is at all showery the leaves are likely to become soft, and, therefore, more susceptible to fungus disease.—ED.]

Plant-houses and stoves.—The plants in this department having made considerable growth during the summer season, an occasional rearrangement is beneficial, changing the position of, and giving more space to, plants required for special purposes. Take the opportunity when doing this, to thoroughly cleanse the wood-

A lesser number of such later kinds as the *N. poeticus*, *N. biflorus*, the sweet-scented *Jonquil* (the double-flowered *Queen Anne's Jonquil*, a desirable but neglected form) should also be planted.

Roses.—As soon as the *Pillar Roses* have finished flowering, many of the old growths should either be entirely removed or be cut back to a point near to the ground, where strong, new growths have probably started. The current season's shoots must be kept fairly thin, so that those which remain may become well ripened. The new growths which are preserved should be loosely tied to the pillars; a free circulation of air is essential, and the tying should merely serve to prevent injury by winds. Such climbing *Roses* as *Gloire de Dijon*, *Cheshunt Hybrid*, *Climbing Captain Christy*, *Kaiserin Frederic*, &c., will not need such vigorous treatment in pruning as benefits the *Polyantha* varieties, and, as a rule, the partial shortening of the older branches and the removal of feeble shoots will suffice, but any plants which are weakly should be pruned severely. A mulching of manure and copious waterings during dry weather will be beneficial at this stage. Untidy flowers of H.P.,

season; or sow the seeds in frames, where they could be fully exposed to the weather until there is danger of damping, or likelihood of frosts occurring, when the lights would need to be put on, and the plants further assisted by the employment of a little fire heat. Such cultivation will considerably extend the season during which Beans are obtainable, and the produce will be very useful in the autumn, when so many of the summer vegetables fail before it is considered time to commence to use those intended for winter consumption. For this late sowing, and for the earliest sowings, we have tried many varieties, but have obtained the best results from the variety *Wythes' Bountiful*, which has a very dwarf, compact habit, that helps to make it particularly suitable for inside culture. Both *French Beans* and *Runner Beans* require a plentiful supply of water during dry weather, especially if mulchings have not been applied. Keep the Beans closely picked for consumption in order that the plants may continue to bear longer; they will certainly suffer untimely exhaustion if the Beans are allowed to hang on and become too old for cooking purposes.

Carrots and Turnips.—If the sowing of these two vegetables has been delayed, the work

should be carried out at once. Of varieties of Carrots, select Early Gem and French Horn, and of Turnips, the more hardy varieties will be most suitable, as was advised in a previous number. Indifferent results will follow if seeds are sown later than August 20, unless they are merely sown for the production of tops for use in the spring, which, although very useful, are generally only a secondary consideration.

Cardoons.—If these have been grown according to the directions given early in the season, they will have made sufficient growth to require blanching, which should be done by wrapping them round with hay bands, afterwards earthing them up with soil. This earthing-up must be done by degrees and as growth proceeds. By making a start now the plants should be ready for use at about the middle of October.

Potatoes.—All early and second early varieties should now be lifted, unless there are any that were planted late for the object of giving a late supply of "new" Potatoes, in which case the tubers should be lifted as they are required for consumption. Where it is intended to save seed-tubers for planting next season, these should be selected straight away and stored separately, protecting them from the wet, but fully exposing them to the light and air. This treatment is to be recommended in preference to the old system of exposing the tubers at the base of a wall out-of-doors, as the heavy autumn rains not only frequently soak the tubers, but saturate the ground under them, causing decay to arise and tending to spread disease.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Ventilation.—The weather having become warmer, the cultivator will be apt to afford too much air to the inmates of the cool or Odontoglossum house. Should the atmospheric temperature out-of-doors range from 55° to 65° with rain falling, there is but little fear that the ventilators may be opened too wide, but when the temperature outside is between 60° and 70° with hot sunshine, the surface of the ground being quite dry at the time, it is a mistake to open the doors or ventilators so wide as to admit large volumes of dry air, or to open such ventilators which are directly opposite to each other, so that a strong draught will thereby be caused. This kind of treatment is oftentimes supplemented with frequent syringings overhead, and waterings at the root, in order to counteract sufficiently the aridity of the atmosphere of the house. I have lately observed such treatment in several collections, and the plants in consequence have become debilitated. It is impossible to lay down any hard and fast rules in regard to ventilation, as much depends upon the position of the house, whether it is situated high up on a hill, or in some low-lying district. The safest course to follow is to admit only as much air as can be kept fairly well charged with moisture, by damping the floors and stages two or three times a day, taking care not to admit much air when the weather is hot and drying. In small houses the bottom ventilators should be used most, except on warm, damp nights when the top ventilators may be opened wide after sunset. Exceptionally long, wide, and lofty houses can be best ventilated through the openings at the apex of the roof. During warm days it is advisable to maintain an atmospheric temperature a few degrees cooler than the air in a shady position out-of-doors. The houses at Burford are of moderate size, and we keep the lower ventilators always wide open, and the top ventilators slightly open, when the external air is warm and there is little wind. These top ventilators we close just previous to the last damping down, which is done at about 4 p.m., in order to get the house thoroughly charged with moisture for the night. When finishing up the last thing, these top lights are slightly opened again if the weather is mild and damp. At the present time the majority of the inmates of this house are just commencing to push up their new growths, but the plants should not be too freely watered, or the old roots will decay before new ones make their appearance. There are some plants that have their new growths well advanced, and are pushing out many young

roots. These will require copious waterings whenever the compost becomes fairly dry.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq., Norwood, Alloa, Clackmannanshire.

Muscat of Alexandria Grapes.—Grapes which are already ripe will require careful attention in order to keep them in good condition. The atmosphere should be kept cool, and a free circulation of air allowed through the top and bottom ventilators. It will be necessary to keep the water pipes just warm, especially at night, in order to dispel damp, a dry atmosphere being essential. Cover the outside borders with sashes to ward off heavy rains. Muscats are liable to decay at the neck of the berry if the vines receive a soaking of water at the roots after the berries are ripe. Even in the absence of such water, the berries are apt to decay during very hot weather, especially after such a cold, wet season as that of 1907.

Later Muscat Grapes.—Vines having fruits that have finished stoning and are now commencing to colour, will require the atmospheric moisture gradually reduced as colouring advances, and after three weeks damping may be discontinued altogether. Keep the house well ventilated by day and night, and the atmosphere dry. Protect the outside borders from the rains. Maintain a considerable degree of heat in the water-pipes (never overheating them), except when there is sunshine, as this will allow of fresh air being admitted to the house. The atmospheric temperature of the house should not exceed 75° at night or 90° during the day. Keep a sharp look-out for red spider, and if this pest is present sponge the leaves with soft soap and hot water, or syringe them in the evening. Be careful not to direct the syringe against the bunches, or they will be disfigured, unless the water is very clean and pure.

Madresfield Court Grapes, which are now quite ripe, will require to be kept as cool as possible, and treated to an abundance of fresh air by night and day. Keep a sharp look-out for decayed berries, and cut or pull them out as soon as they are detected. This variety is such a thin-skinned Grape and liable to decay, the berries require to be examined every day. It is not a Grape that will keep in good condition for a long period.

Strawberries.—Plants in 3-inch pots should be shifted into their final pots without delay. Afford the roots plenty of water if hot weather continues, and manure water also, to assist in building up strong, healthy crowns. Do not place the plants too closely together and so cause them to become drawn. During growth they require to be given a well-exposed position where they will get the sun's rays all day. Place them on a hard base, preferably one formed with ashes. To prevent them rooting through the pots, turn each plant round, or shift all of them to another place occasionally. As soon as runners are observed they must be cut off.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bickton, East Devon.

Morello Cherries.—These fruits are usually ready for bottling at this date. They should be gathered when perfectly dry, and be placed very thinly on large, shallow trays or similar receptacles. Select those fruits for bottling that are of a deep, blood-red colour, and cut the stalks with either a sharp knife or a pair of scissors, so that no juice will be lost. Fruits intended for jam making should also receive careful attention, but they need not be quite so ripe for this purpose as in the case of those for bottling. Morello Cherries are much appreciated for the making of tarts, and it is usual to retain part of the crop on the trees as long as is possible for this purpose, but when signs of shrivelling or general decay are apparent the fruits should all be gathered. We experience some difficulty in this district, which has usually a moist atmosphere, in keeping the fruits sound after the middle of September. When sending them a considerable distance, shallow boxes, deep enough for one layer of fruits only, should be used.

The Fig.—In normal seasons in these gardens a dish of Figs can generally be had about the middle of this month, but they will be quite a fortnight later in ripening this season. Figs should be gathered when they are quite ripe; a half-ripened Fig is most insipid in eating. Wasps are particularly fond of Figs, therefore, bottles containing beer or cider sweetened with sugar should be hung on the trees. A Fig that has been ripened by the direct rays of the sun shining on it is of very much better flavour than one that has grown in a less favoured position, hence the necessity of keeping the growths thinly trained at all seasons.

The Loganberry.—This fruit has been very fine this season; it is a matter of surprise the plant is not grown more extensively in gardens. A suitable method of training the long growths is to obtain larch poles from 10 to 12 feet in length, and to set these at this distance apart, with a piece of batten on either side to keep them in position. It is an easy matter to train the growths right and left of this structure, and a plant should be set at the base of each upright. The old canes, after they have borne fruit, should be cut out near to the base of the plant, so that the new growths may receive the full benefit of the sun; the new shoots should be reduced to a moderate number, for if too many remain the crowding will end in comparative failure.

Autumn-fruiting Raspberries.—The canes will require supporting either with stout cord or with wire stretched on stakes along the centre of the row. The frequent rains of this summer have suited this fruit, and there should be good crops, provided the weather of autumn is favourable.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Painting fencing, railings, &c.—The painting of the various kinds of ironwork used about a public park forms, as a rule, a considerable item in the annual bill for labour and materials. The proper maintenance of iron railings alone costs a considerable sum annually, and if the work is not very carefully carried out it is often only so much waste. Ironwork should never have any paint applied to it until all rust and dirt have been removed, and in the case of new iron the mill scale should be scraped off and the surface burnished. Strips of card-wire nailed upon flat pieces of wood form excellent material for use in burnishing after the worst of the rust has been removed with an iron scraper. The burnishers should not be very far ahead of the painters, in case rain may fall, when the work would require to be done over again.

Applications of paint.—It is usual to apply three coats of paint to ironwork unless it is painted every year, when one is generally sufficient. The first coat should consist of a lead paint, and the second and last of an oxide paint. As a check upon the men engaged in painting, whether they are employed by a contractor or employed direct by the department, it is always a good plan to have the colour of each coat of paint distinct from the others. In this way it is a very simple matter to see that the three coats arranged for are actually applied. At one time, when the painting of iron fencing was not considered to come within the scope of practical painters' work, we used to employ ships' painters for the purpose, with very satisfactory results. Recently it has been decided that technically it is painters' work, hence house painters must in future be engaged for all painting purposes. Of course where tar or bitumen is used in place of paint, unskilled men may still be employed.

Time for painting.—In the past we have always carried out the painting of railings during the summer months, when the air is driest and when there is least risk of having the paint washed off with rain. This year—perhaps fortunately—it was decided to postpone painting the fences until the winter, when dust is not so troublesome and the sun has not such a detrimental effect upon the paint by cracking it. Whether the advantages of doing the work at this period of the year will outweigh the disadvantages has yet to be proved, although several practical men have assured me that, provided frost is not prevalent, painting done in winter is much the best.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 17—

Sheffield Fl. Sh.
German Gard. Soc. meet.

TUESDAY, AUGUST 20—

Roy. Hort. Soc. Coms. meet.
Brighton Fl. Sh. (2 days).
Brit. Gard. Assoc. Ex. Council meet.

WEDNESDAY, AUGUST 21—

Shropshire Hort. Soc. Sh. at Shrewsbury (2 days).
Charlton Kings Fl. Sh.

THURSDAY, AUGUST 22—Aberdeen Fl. Sh. (3 days)

FRIDAY, AUGUST 23—

Roy. Bot. Soc. meet.
Rose Sh. in Manchester Botanic Gdns.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—61.1°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 14 (6 P.M.): Max. 73°; Min. 61°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 15 (10 A.M.): Bar 29.7; Temp. 65; Weather—Sunshine, with occasional clouds.

PROVINCES.—Wednesday, August 14 6 P.M.: Max. 67°, Bournemouth; Min. 54°, North of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY—

Great Sale of Dutch Bulbs at Messrs. Protheroe & Morris's rooms, 67, Cheapside, E.C., at 10 o'clock.
Trade Sale of Japanese and Azorean Liliiums, &c., at Messrs. Protheroe & Morris's rooms, 67, Cheapside, at 2 o'clock.

THURSDAY—

Dutch Bulbs at Messrs. Protheroe & Morris's rooms, at 10 o'clock.

FRIDAY—

Importation of *Odontoglossum crispum* (Pachs' type) Orchids in flower and bud, at Messrs. Protheroe & Morris's rooms, 67, Cheapside, E.C., at 12.45 o'clock.

Ants as Gardeners.

The reference made to "Ants as Cultivators of Fungi," by the Rev. George Henslow, in the last number of the *Journal of the Royal Horticultural Society* (June, 1907, p. 99), reminds us that although ants in this country are not without interest, yet, in tropical regions, they play a much more important part in the economy of Nature than they do here. By cutting off leaves, flowers, fruits, &c., which they carry home to their nests, certain species make gardens in the combs on which they grow fungi. "The fragments are cut up at home into small pieces, kneaded soft by the feet and mandibles, so that but few cells remain unbruised." This mass soon becomes permeated with mycelial threads, which produce rounded, whitish nodules, the so-called Kohl-rabi clumps that serve the ants for food. As long ago as 1781 Smeatham stated that certain species of termites grew a fungus in the chambers of their nests, and that they used this fungus for food. In 1847 the Rev. M. J. Berkeley described several species of fungi from ants' nests in Ceylon, from specimens sent home from that country; while, more recently, Penzig, Saccardo, Holtermann, Hennings, Nyman, and Dörflein have added to the list of names given to ant-hill fungi.

As so many of these species have been described from dried specimens, it is no wonder that their synonymy is somewhat complicated.

The Government mycologist resident at the Royal Gardens, Peradeniya, Mr. T. Petch, has recently given his attention to this interesting subject, and, in a critical memoir, published in the *Annals of the Peradeniya Gardens**, for November, 1906, arrives at the conclusion that the commonest fungus of termite nests in Ceylon is really a *Volvaria*, *V. eurhiza*, Berk. Originally described by Mr. Berkeley as an *Agaricus*, it has had many designations, thus:—*Volvaria eurhiza* (B.), *Agaricus* (*Armillaria*) *eurhiza*, B. Hooker's *Journ. Bot.* 6 (1847), p. 483; *Lentinus cartilagineus*, B. Hooker's *Journ. Bot.* 6 (1847), p. 469; *Collybia sparsibarbis*, B. and Br. *Linn. Trans.* 27 (1870), p. 151; *Agaricus* (*Pluteus*) *Rajap*, Holtermann, *Festschrift für Schwendener* (1899), pp. 411-321; *Pholiota Janseana*, Henn., and Nym. *Monsunia I.* (1899), p. 18; *Flammula Janseana*, Henn., and Nym. *Monsunia I.* (1899), p. 154.

Mr. Petch summarises his work as follows:—

1. The existence of fungi in some termite nests is a matter of common knowledge. In Ceylon, fungi are found in the nests of ground-inhabiting species, but have not yet been demonstrated in the nests of those which inhabit trees. The species here dealt with are *Termes redemanni*, Wasm., and *Termes obscuriceps*, Wasm.; both are ground-dwelling and mound-forming species.

2. The termite hill is built of the earth excavated in making subterranean chambers, and was originally only a convenient method of disposing of this material. The chimneys form a permanent scaffold, and have little effect on the ventilation of the nest. They are not correlated to the size of the nest in any degree.

3. The particles of earth used in constructing the hill and chimneys are covered with saliva in the nest, and are then brought up and placed on the new work.

4. The fungus grows on a comb, which consists exclusively of the excreta of the termites. These combs occur in every chamber except the royal cell. There is no allocation of different chambers for special purposes. Combs vary in form according to the species of termite inhabiting them.

5. The mycelium on the comb bears small, white, stalked or almost sessile "spheres." These consist of branching hyphæ, bearing either spherical or oval cells. The spherical cells do not germinate. The oval cells germinate readily, but it has not been possible to reproduce the "spheres" from them.

6. When the comb is old, an agaric grows from it. This agaric appears in two forms, one of which has been assigned by various mycologists to *Lentinus*, *Collybia*, *Pluteus*, *Pholiota*, and *Flammula*, and the other to *Armillaria*. It develops in a cartilaginous, almost gelatinous, universal veil, and is a modified *Volvaria*.

7. Sclerenchymatous cells occur at the base of the agaric stalk and in aborted agarics.

8. It has not been possible to germinate the spores of the agaric, or to grow the sphere-producing mycelium from its tissues.

9. When the comb is enclosed in a bell jar, *Xylaria stromata* are produced. Sclerotia may also be formed; the same stromata grow from these. This *Xylaria* is probably *X. nigripes*.

10. The shape of the stroma and conidiophore depend on the age of, and amount of moisture in, the comb.

11. When sown on agar, the spores of these reproduce the *Xylaria stromata*.

12. These stromata occur most abundantly on combs which have produced an agaric.

13. After continued rain, *Xylaria nigripes* grows from deserted termite nests.

14. Other fungi which grow on combs removed from the nest include *Mucor*, *Thamnidium*, *Cephalosporium*, *Peziza*. As these are not found in the nest, though some of them are capable of development under ground, it is probable that the termites "weed out" foreign fungi from the cultivation of the comb. The comb material is probably sterilised by its passage through the alimentary canal.

15. That the spheres form the food of the termites is probable, as in the case of the leaf-cutting ants; neither case can be considered definitely proved. *Termes redemanni* and *T. obscuriceps* undoubtedly prefer fungi, or wood which has been attacked by fungi.

16. Whether a difference in food causes the differentiation of termites into workers, soldiers, and sexed insects is not decided.

17. A Ceylon agaric, *Entoloma microcarpum*, possesses a mycelium composed of spheres of swollen cells; the details of these spheres resemble the parts of the termite spheres, but are not so highly developed.

18. It is most probable that the "spheres" in the termite comb, and the "Kohl-rabi-häufchen" of the leaf-cutting ants investigated by Möller, are parts of a normal mycelium, and that their shape is modified by the insects only in a very slight degree, if at all.

19. The available evidence appears to show that the "spheres" are part of the mycelium of the *Volvaria*, but it has not been possible to connect these forms experimentally.

The paper is illustrated by 19 plates from photographs of the exterior and interior of the nests, the combs, the agarics, the spheres, mycelium, the *Xylaria*, other fungi, microscopic details, &c., and it affords a valuable contribution to our knowledge of this interesting subject.

OUR SUPPLEMENTARY ILLUSTRATION affords a view in the Water-lily house at Shipley Hall, Derby, the residence of E. MILLER MUNDY, Esq. This structure was formed in March of last year from an old Palm house, which was provided with a new lean-to roof and a central tank for the accommodation of tender species of *Nymphæa*. The house is so adapted that it forms a Water-lily house in summer time and a greenhouse-conservatory in winter, see fig. 50. The water basin which occupies the centre of the house is 38 feet in length and 12 feet in width, inside measurement, whilst the depth is 2½ feet. Close to the sides of the basin, and a few inches only from the bottom are flow and return 4-inch hot-water pipes, which are provided with valves, so

* "The Fungi of Certain Termite Nests," T. Petch, *Annals of the Royal Botanic Gardens, Peradeniya*, Vol. III., Part II., November 1906.

COSMOS SULPHUREUS; A SHOWY ANNUAL PLANT WITH REDDISH-ORANGE
COLOURED FLOWERS.

that the temperature of the water can be regulated to 70° in winter and 85° in summer. The temperature of the house is that of a moderately warm greenhouse. Sunshine being so important a factor to the well being of *Nymphæas*, no shading whatever is employed, and the walls and the benches are furnished with plants which like plenty of sunlight. At the foot of the lofty back wall are planted, in a border raised 3 feet from the floor and 30 inches in width, *Bougainvilleas*, *Heliotropes*, Citrons, a specimen of *Swainsonia* and another of *Acacia dealbata*. An end wall is covered with *Camellias*. The front stonework of the back border is draped with Ivy-leaved *Pelargonium* Mme. Crousse, and baskets of this and other varieties of *Pelargoniums* are suspended to the girder along the centre of the house, as is shown in the

year on April 5, and the photograph, from which our supplementary illustration was prepared, was taken on June 7. *N. stellata* is the most free in flowering. The blossoms open at about 6 a.m. and close from 1-30 p.m. to 2-30 p.m. *N. pulcherrima* is similar in habit to *N. stellata*, and produces magnificent flowers which are rather longer in opening than those of the first-named species. These Water-lilies are both sweetly scented. *N. gigantea* is a handsome plant. The flowers are very freely produced and it has foliage smaller than the other species at Shipley Hall. The flowers, if cut just before they are fully developed, will remain open night and day in a warm room, and will last in a fresh condition for a period of 10 days. *N. rosea* has the largest flowers and leaves, but the colour of the floral segments is

a view of the house as it appeared on February 5 last, and shows the structure furnished in this manner with Lilacs, Laburnums and similar plants. At the same time the side benches were occupied with *Hippeastrums*, which had 100 flower-spikes expanded. The partial shading of the *Nymphæas* by these plants caused no harm whatever to the water inmates. Flannel-weed was at first a nuisance, but the introduction of a dozen gold fish and some water-snails counteracted this trouble. Mr. J. C. TALLACK, the gardener, is to be congratulated on the success of this novel house, which is at all seasons a source of pleasure and an object of beauty.

THE LATE DR. MASTERS' HERBARIUM.—Mrs. MASTERS has presented to Kew the whole of

FIG. 50.—THE NYMPHÆA HOUSE AT SHIPLEY HALL IN WINTER.

(See also Supplementary Illustration.)

supplementary illustration. The side benches are furnished with flowering-plants, including *Schizanthuses*, *Fuchsias*, *Salvias*, *Richardias*, *Poinsettias*, &c. In the early part of February, plants of *Amaryllis* furnish these benches, and later they are gay with forced bulbous plants, *Azaleas*, *Lilacs*, &c. Several varieties of *Nymphæas* were planted in the tank at the commencement, but their number has been reduced to 11 plants, viz., five of *N. stellata* Berlin var., two of *N. gigantea*, and one each of *N. pulcherrima*, *N. rosea*, *N. Devoniensis* and *N. George Huster*. Each is planted in about two bushels of good soil in the form of a mound, and the crowns are about 18 inches below the surface of the water. They were planted this

not the most pleasing. The flowers of *N. Devoniensis*, when first expanded, are pink, but they change to red; those of the variety *N. George Huster* are of a deep glowing crimson colour, and the variety has handsome dark foliage. Both the last named are night-flowering varieties, but they are open also during the greater part of dull days. The *Nymphæas* do not reach their resting season in time to allow the water surface to be furnished with *Chrysanthemums*, but later, when the flowers and most of the leaves of the Water-lilies have disappeared, drain pipes are stood on end in the water wherever room can be found for them, and on these are placed various forced plants which are changed from time to time. Fig. 50 represents

the botanical collections and manuscript notes of the late Dr. M. T. MASTERS, F.R.S., except his complete herbarium of the British Flora, which, by his wish, has been sent to his native city of Canterbury. We are informed by the Director of the Royal Gardens, Kew, that the collections have not yet been examined, but that they doubtless contain some valuable materials, particularly of the groups of which Dr. MASTERS made a special study.

PROFESSOR D. J. BEHRENS, director of the Agricultural Research Station at Augustenberg, in Bavaria, has been appointed successor to Dr. ADERHOLDS, director of the Biological Institute at Dahlen.

FLOWERS IN SEASON.—Mr. AMOS PERRY, Enfield, sends seedling varieties of *Spiræa venusta*, with flowers of many shades of pink, both deep and light.

Messrs. TITT & SON, 24, Thames Street, Windsor, have forwarded flowers of a new *Scabiosa* named the Bride. The capitulum are almost globular in shape, and the florets pure white.

Messrs. JAMES VEITCH & SONS have sent us, amongst other interesting plants, flowering sprays of *Clethra canescens*, *Colutea melanocalyx*, *Eucryphia pinnatifolia*, a very handsome shrub, with large white flowers; *Romneya Coulteri*, *Cornus macrophylla*, one of the best of the genus; *Cytisus nigricans*, *Buddleia variabilis* var. *Veitchianus*, a form with large pyramidal-shaped inflorescences; *Senecio Veitchianus*, a suitable plant for the waterside; *Pavia macrostachya*, and many beautiful *Spiræas*.

Mr. T. SMITH, Daisy Hill Nursery, Newry, sends a form of *Comptonia asplenifolia*, with depauperated or interrupted leaves. The variation, Mr. Smith states, is to some extent fixed, as many plants come true from seed. Also *Centaurea atropurpurea*, a Servian species, with curious reddish-purple flowers. It grows 2 to 3 feet high, and the leaves are very handsome.

NURSERY EMPLOYEES OUTING.—By the invitation of Mr. HARRY J. VEITCH the heads of the various departments of the firm of Messrs. JAMES VEITCH & SONS, together with a few friends, visited East Burnham Park on the 5th inst. The company included Mr. JOHN GOULD VEITCH and the late manager of the King's Road Nurseries, Mr. THOMAS MANNING. A saloon carriage conveyed the party to Slough, where the visitors were met by Mr. HARRY VEITCH. Two large brakes conveyed the members to the seed trial grounds of the firm at Langley. After inspecting these, a trip of about four miles, through interesting, though flat country, brought the company to East Burnham Park, the country home of Mr. H. J. VEITCH, where Mrs. H. J. VEITCH and Mrs. J. G. VEITCH gave the company a cordial welcome. After partaking of lunch, a game of bowls was indulged in by some members of the party, a survey of the gardens and grounds made by others, and a game of cricket was also provided. At 6.30 the party prepared for the return journey to Slough by a different route, completing the run to London by rail.

BRUSSELS BOTANIC GARDEN.—M. LOUIS GENTIL has prepared an excellent list of the plants cultivated under glass in the Jardin Botanique de L'Etat at Brussels. The collections include about 1,000 genera, and 3,200 species. The list contains 5,700 names and synonyms, with their authors. The native country of each species is indicated and references are given to works containing illustrations. We have frequently referred to the richness of the plant collections in these gardens, especially of the Ferns, and numerous illustrations of the interior of the glasshouses have been reproduced in these pages. The garden is under the scientific direction of M. E. DE WILDEMAN, and M. LOUIS GENTIL is Curator. The latter gentleman is well known and respected in this country, having passed some time in the Royal Gardens, Kew, and in other horticultural establishments.

THE LAWES AGRICULTURAL TRUST.—We are informed that the following gentlemen have recently been appointed on the staff of the Rothamsted Experimental Station:—Dr. E. J. RUSSELL, lately of the South-Eastern Agricultural College, Wye, as the Goldsmiths' Company's Assistant for the Investigation of Soils; and Dr. H. B. HUTCHINSON, of the Midland Agricultural and Dairy College, Kingston, Derby, as Bacteriologist.

DISEASES OF BEES.—The Bureau of Entomology of the U.S. Department of Agriculture, in Bulletin No. 70, in its report of the meeting of Inspectors of Apiarists at San Antonio, Texas, on November 12, 1906, has embodied information concerning the diseases of bees. The appended list of subjects will show how important to apiarists in the States, and other countries, is the information given:—The bacteriology of bee diseases; the present status of the investigation of bee diseases; American foul brood on the Pacific Coast; symptoms of bee diseases; geographical distribution; comparison of diseases; infection in honey; infection of larvæ; bacteria in queens; black brood; infection carried to flowers; vitality of spores; existence of American foul brood and European foul brood; effect of climate on virulence; and treatment for bee diseases. Much of the information supplied is by the method of questions and answers, and it is interesting, even to the general reader. The Bulletin may be obtained from the office of the Department of Agriculture, Washington.

MR. ARTHUR C. SMITH.

MR. A. C. SMITH, ASSISTANT SUPERINTENDENT AT WISLEY.—Mr. ARTHUR C. SMITH, whose appointment as assistant superintendent in the Royal Horticultural Society's gardens at Wisley was recently announced in our columns, commenced his gardening career under his father, who was for upwards of 30 years head gardener at Dormont, in Dumfriesshire. Mr. SMITH on leaving Dormont came south to Yorkshire, and for two years he was in the service of Sir JOHN RAMSDEN, Bart., at Byram Park, Ferrybridge. He next served in the gardens at Brayton Hall, Cumberland, the seat of Sir WILFRID LAWSON, Bart., and later at Petworth Park, Sussex, the seat of the Earl of LECONFIELD. From this latter place he became foreman at Ascog House, Isle of Bute. A second journey south, this time to Devonshire, was for the purpose of accepting the general foremanship at Knightshayes Court, Tiverton, the seat of Sir JOHN H. AMORY, Bart. Mr. SMITH's first office as head gardener was at Eden Hall, Langwathby, Cumberland, which post he held for nearly six years. He has also served in this capacity for nearly 2½ years at Woodlands Park, Leatherhead, and three years at Lydhurst Gardens, Haywards Heath, where he was engaged at the time of his recent appointment.

THE DIFFERENT SOILS IN STAFFORDSHIRE.

—We are informed that Mr. J. J. WILLIS, of the Rothamsted Experimental Station, Hertfordshire, is arranging to deliver a lecture at Market Drayton, Shropshire, during next week, to farmers on the subject of the food requirements of the Staffordshire soils as indicated by the natural growth of the weeds and the various field crops.

A NEW HYBRID NYMPHÆA, L. DITTMANN.

This hybrid is the result of a cross between *Nymphæa zanzibariensis* var. *cœrulea*, which has flowers of a deep blue colour, with another blue-flowered Australian species belonging to the *gigantea* group. It was raised, says *Gartenflora*, in Hrn. H. HENKEL's nursery at Darmstadt in 1902, and it flowered with him in the two last summers. The agreeably-perfumed blooms have a diameter of 22-25 cm. and are of a tender Peach tint; if the flowers are removed from the plant, they become of a bluish tinge the next day; but no such change takes place in the blooms while on the plant, excepting under low temperature in late autumn. The blooms are finer in colour than *N. zanzibariensis* *rosea* and *rubra*, of flatter form, and larger. The anther mass is bright yellow, with light pink coloured points, and the stigmatic surface broad and flat; the sepals are green on the outside, and the points sideways incurved; interior white, with greenish nerves. The plant is of vigorous growth; blooms freely, even in water of a low degree of warmth. Like all strong-growing aquatics, it needs rich feeding, and water of not less than 15-25 cm. in depth. The plant is named after the successful cultivator of *Nelumbiums*, L. DITTMANN, of Darmstadt.

THE PEAR THRIP.—The destructive Pear Thrip (*Euthrips pyri*, Daniel) is a pest of deciduous fruit trees in the San Francisco Bay region of California. So widespread and injurious is this insect in the Santa Clara county, that an investigation was undertaken at the request of the county Board of Supervisors, who furnished the funds and liberally granted necessary facilities for a thorough and scientific study. The investigation extended through a period of 15 months from February, 1904, to April, 1905. The results of this investigation are incorporated in the issue, in June of the present year, of a pamphlet of 16 pages by the U.S. Department of Agriculture, from the pen of Mr. DUDLEY MORTON, who is engaged in investigations concerning insects which attack deciduous fruit trees. This publication contains matter relating to the mouth parts; relation of the budding and blossoming of trees, to the feeding habits of the thrips; feeding habits of larvæ; life-history—the egg, the larvæ; the nymph or pupa, and the adult; methods and natural factors in control; sprays, cultivation and natural enemies. A fungus, presumably parasitic, was prevalent among thrips during the seasons 1905 and 1906. In its different stages it lives on both young and mature thrips, and in a way parallels the life of its host. Mrs. F. W. PATTERSON has determined the fungus to be a species of *Cladosporium*. The life history of the fungus has been determined only in part.

APPLE HEINSBERG'S NONPAREIL.—This variety is highly commended by H. WIESNER in *Thalacker's Handels Journal* for its rapidity of growth, its cone-like habit of growth, and good keeping properties. In good loam without manure, budded plants on healthy, vigorous stocks of the Crab reach a height, in the first year, of about 3 feet 7 inches; in the second year, with or without severe cutting back, the stem reaches standard height, and in the third year after budding, the crown has made shoots 24 inches in length, the plant being then of saleable size as a standard. The writer of the note in *Thalacker's* is the manager of the Grand Ducal Nursery at Friedberg.

AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS.—The American park superintendents are holding their annual meeting in Toronto during the present week. Papers were to be read upon such subjects as "Band concerts in smaller or district parks," "Aquatic gardens," and "Some new or little-known trees and shrubs for planting in parks." In our own country the park superintendents have not as yet formed a similar association, but public parks are now so numerous that if any movement of the kind were started, it would doubtless be successful.

Publications Received.—*Weather*, by the Hon. H. A. Stanhope, published by the Agricultural and Horticultural Association, Ltd., price one penny.—*Report on the Injurious Insects and Other Animals Observed in the Midland Counties during 1906*, by Walter E. Collinge, M.Sc., F.E.S. IV. Report published by Cornish Bros., Ltd., Birmingham. Price 2s. 6d.—*Fibres of the Jute Class*, by E. W. Davy, being a supplement to the *British Central Africa Gazette* of May 31, 1907.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 84-90.)

(Continued from page 105.)

4. MIDLAND COUNTIES.

BEDFORDSHIRE.—A lack of sunshine and cold weather has caused all crops to be very backward this season. I find that Apples, Pears, and Plums will produce good crops every other year only. It is remarkable that Plum trees of the variety Victoria both on wall and on standard trees are bearing heavy crops, and the foliage is clean; last year the reverse conditions obtained. Ours is a gravelly and sandy soil. *H. W. Nutt, Flitwick Gardens, Ampthill.*

—Notwithstanding the inclement weather experienced during May, June, and part of July, the fruit crops on the whole are very satisfactory, with the exception of Apples. On examining the Apple trees about the middle of June, they appeared very much affected with blight and mildew, and although insecticides were applied they proved of little use. At one time I attributed the damage to late frosts, but on consulting my weather register, I found that during the time the trees were in bloom no frosts were registered. Our soil is a light sandy loam, on a subsoil of chalk, clay, and sand. *George MacKinlay, Wrest Park, Ampthill.*

—The Apple trees in this district are badly infested with aphids, and this has caused a great check to the growth of the fruits; and from this cause a considerable number of the fruits have dropped. Apricots, Gooseberries, and Plums (Victoria in particular) have enormous crops of fruits, and they required much thinning. Strawberries have given good returns; the variety "Mentmore" ripened best during the sunless weather and proved itself almost immune from attack by mildew. *Wm. F. Palmer, Froxfield Gardens, Woburn.*

BUCKINGHAMSHIRE.—Notwithstanding the cold weather of early summer, the fruit crops in this neighbourhood are exceptionally good, and the fruit trees generally seem to have escaped the effects of the late frosts. Apricot trees are generally short-lived in this district. Strawberries set an abundant crop, but the cold, wet and sunless weather spoiled many of the early fruits. *John Fleming, Wexham Park Gardens, Slough.*

—I have never seen the fruit trees in this district more heavily laden with blossom than they were this spring. Apples set well, but the prolonged wet and cold weather have prevented many of them from developing. The Pear crop is excellent, and the season seems to have suited this fruit. Cherries are a good crop, especially the varieties May Duke and Black Tartarian. Morellos are also plentiful. Apples are an average crop. Raspberries are plentiful, the variety Superlative being excellent. Gooseberries, Red and Black Currants are abundant. Strawberries have been a heavy crop, but owing to the inclement weather a number of the berries rotted on the plants; especially was this the case in the variety Royal Sovereign. Plums on wall trees are good, but bush and pyramid-trained

trees have very few fruits. Damsons are also a poor crop. The soil here is light and gravelly, resting on a subsoil of chalk. *G. W. Smith, Dunsfield Gardens, Marlow, Bucks.*

—Apple trees blossomed abundantly and promised well for a heavy crop of fruits, but cold, north-east winds and frost at night-time caused many of the young fruits to drop. Some varieties of Apple trees, however, have full crops, the best of dessert kinds in this respect being Cox's Orange Pippin, Wealthy, Chas. Ross, Beauty of Bath, and Langley Pippin; while, of culinary kinds, Warner's King, Grenadier, Loddington Seedling, Peasgood's Nonsuch, and Stirling Castle are the best cropped. I never remember such a plague of insect pests of all kinds as we have experienced this spring, notwithstanding that the trees were sprayed in February, and, in the case of trained trees, hand picking was resorted to. Pears are a poor crop on pyramid and standard-trained trees, but plentiful on wall trees. Plums are excellent, and this remark also applies to bush fruits of all kinds. Quite the best crop of the year in this locality is that of the Apricot. I attribute this to the dry, sunny weather when the trees were in flower, and also to the flowers opening much later than is usual. Strawberries promised well, but the dull, sunless weather of early summer and the excessive rainfall at the end of June caused the fruits of early varieties to rot badly. Late fruiting varieties were more satisfactory. *Chas. Page, Dropmore Gardens, Maidenhead.*

—Most of our fruit trees are badly blighted—never more so; and this appears to be general throughout the county. All the crops are very backward, but those already matured are fairly good. Givon's Late Prolific Strawberry on our cold soil has proved to be a more reliable variety and a much better cropper than Waterloo. In some orchards Greengages are very abundant. Our soil is a heavy loam resting on clay. *W. Hedley Warren, The Gardens, Aston Clinton, Tring.*

CHESHIRE.—Apples, Pears, and Plums, in their early stages, showed great promise for heavy crops, but, owing to continuous wet and cold weather, the number of these fruits will be much below the average. All the fruit crops in this district will be very backward. *J. Burdge, Moreton Hall Gardens, Congleton.*

—The prevalence of frost, and cold east winds, with an almost continuous downfall of sleet and rain, had a very injurious effect upon the Apple crop at the time the trees were blooming. Strawberries have suffered from a lack of sunshine and constant rains, and many of the berries have in consequence rotted on the plants. The soil in this garden is of a light texture, with a boggy sub-soil. *Peter Wilkinson, Walton Lea Gardens, near Warrington.*

—Generally the fruit crops in this district promise much better than could be expected after the severe frosts of May 20 and 21, when 5° and 9° of frost were registered. Currants and Gooseberries on exposed branches were badly injured by the cold, as were also Apples and Pears in the less sheltered portions of the gardens, while even Plums on wall-trees received a check, which caused quantities to drop. The absence of sunshine during June and early July has mitigated much against a quick and clean development of all kinds of fruits, and general disappointment in the condition of the crops prevails around here. *N. F. Barnes, Eaton Gardens, Chester.*

DERBYSHIRE.—A good set of fruits generally has been much reduced by the continuous cold weather and heavy rains during May and June. Strawberries were very late in ripening, and the flowers set badly owing to excessive rains. Our first picking out-of-doors of this fruit was on July 23. The best variety that withstood the effects of the untoward weather was Louis Gauthier. Many of the flower-scapes of this variety were 18 inches high, sufficient to rear them well above the foliage. Givon's Late Prolific also promises well. Gooseberries are a heavy crop of fine fruits, and the same remark applies to red and white Currants. The rainfall in these gardens for the year is greatly above the average, and totals 17½ inches (July 23). The abundant rains would have done much good had the temperature ranged higher during May and June. *J. C. Tallack, Shipley Hall Gardens, Derby.*

—The fruit trees on the strong clay soil of this district have not satisfactory crops. Bush

fruits, except Black Currants, are abundant. Improved cultivation of this latter fruit might be brought about by frequent plantings of strong, healthy bushes on well-trenched and heavily-manured land. The useful Loganberry is seen in a good fruiting condition in several of the cottagers' gardens in this neighbourhood. This fruit has no equal amongst the smaller fruits for jam making or for tarts, and the canes should be extensively planted by all fruit-growers. I consider Raspberry Superlative the very best variety of this fruit. The cold, wet weather has caused Cherries to become badly cracked. Strawberries in many places about here are quite a failure. This could be largely avoided in future years by making annual plantations from plants layered in pots and planted in good, firm, well-manured ground in the autumn. *Bailey Wadds, 181, Uttoxeter New Road, Derby.*

—The fruit crops in this district are in general very good, but owing to the heavy rainfall and a lack of sunshine in early summer, the fruits will be much later than usual in ripening. Apple, Pear, and Plum trees all blossomed well, but they have set an average crop only. Strawberries were plentiful, but they did not ripen well. Gooseberries are abundant. Raspberries, Black, Red, and White Currants are all heavy crops. With the exception of Plums, the trees are exceptionally clean and free from blight. Our soil is a medium loam on a sub-soil of gravel and clay. *James Tully, Osmaston Manor Gardens, Derby.*

HERTFORDSHIRE.—The soil in these gardens consists of some 15 to 18 inches of strong loam, which rests upon a bed of clay 3 feet in thickness. Under this latter strata is sand. Cherry trees flowered freely, and the fruits set well, but many dropped at the stoning period. I attribute this to the long period of dull and unseasonable weather which prevailed at this stage. Plum trees set a very large crop of fruits, but the adverse weather also affected these at the stoning period. The crop is about an average one, and the fruits are clean and of good quality. Apple trees flowered freely, and set a full crop, but there is an unusually large number of deformed and useless fruits. Pears are an average crop of clean, shapely fruits. Raspberries are very plentiful; the berries are large and quite the best crop for seven years past. Black Currants are also excellent in quality, and a very heavy crop. Trees of Peaches and Nectarines out-of-doors flowered profusely, set their fruits in plenty, and, though more than usual have failed at the stoning period, the crop is an average one, but it is doubtful whether any other than the earlier varieties will ripen well. *C. R. Fielder, North Mymms Park Gardens, Hatfield.*

—The fruit crops generally in this neighbourhood are much above the average. Apple trees in some places have suffered badly from an attack of green and black fly, but with better weather and the finishing of summer pruning there is every promise of a good harvest of these fruits. Apricots set so freely that more than half the fruits had to be removed. Gooseberries are a remarkable crop. *C. E. Martin, The Hoo Gardens, Welwyn.*

—The low temperatures and cold winds experienced during early May caused many Plums and Damsons to fall; up to that date the crops of these fruits were very promising. The long succession of sunless days in early summer doubtless accounts for the presence of aphids on Plum and Apple trees. Pears, Peaches, and Nectarines are all very plentiful. Small fruits are good. The soil here is of a fairly stiff nature, and rests on a varying sub-soil of gravel and clay. *H. Prime, Hatfield House Gardens, Hatfield, Herts.*

—The cold, sunless weather adversely affected the Apple crop, for, although the trees were wreathed in blossoms, the fruits did not set. Pear trees are carrying fair crops, notably the varieties Pitmaston Duchess and Marie Louise; the latter seldom fails when planted against a wall. Cherries, in common with other stone fruits, promised exceptionally heavy crops, but many of the fruits dropped at the stoning period. Plums, Strawberries, and small fruits are all excellent. The Loganberry never fails to yield a supply of its luscious fruits, and is deserving of a place in every garden. The soil here is a light loam upon a gravel sub-soil. *F. W. Gooch, Edge Grove Gardens, Watford.*

— Apples are plentiful, but the individual fruits promise to be small in size. Strawberries were a good crop, but owing to the exceptionally wet weather, many decayed before they were ripe. Gooseberries and Black, White, and Red Currants are all plentiful. I never remember having seen Raspberries in a better condition than they are this season. Nuts, with the exception of Walnuts, are scarce. Plums are a heavy crop. The soil in these gardens is of a very stiff nature, and rests on a light-coloured clay, and in some parts upon chalk. *William Poole, Hadham Hall, Ware.*

— All kinds of fruit trees flowered splendidly, but what promised to be the best fruit season for several years past has been ruined by the very unseasonable weather. On July 2 the thermometer registered only 37° Fahr. Our soil is very shallow, and rests on chalk. *Arthur Dye, Tring Park Gardens, Tring.*

— Generally the hardy fruit crops in this district are an average in quantity. The promise for a good Apple season was great when the trees were in flower, but the fruits set badly, and the trees are now badly infested with insect pests. The crops of Plums, Cherries, and Apricots are good. *Edwin Beckett, Aldenham House Gardens, Elstree.*

LEICESTERSHIRE.—The Apple crop in this district, considering the abundant promise when the trees were in bloom, is disappointing. Plums on standard trees are plentiful, but on the wall trees the crop of this fruit is thin, the frosts in April being responsible for the shortage. With the exception of Black Currants, bush fruits are a heavy crop. Strawberries have been much damaged by the excessive rains, which continued up to the middle of July. These fruits are three weeks later in ripening than usual. Givon's Late Prolific promises to be our best late variety. The soil in these gardens is a medium to heavy loam on a sub-soil of red clay. *D. Roberts, Prestwold Hall Gardens, Loughborough.*

— The failure of the Apple crop this season is due solely to exhaustion of the trees caused by last season's heavy crop; bush trees on cultivated ground which has been thoroughly well manured every year, are bearing good crops. Peach, Apricot, and Cherry trees benefited greatly by the hot weather of last autumn; this caused the fruiting wood to become extra well matured, with the result that the crops of these fruits are more abundant than I have ever before seen in this part of the kingdom. Strawberries have partially failed this season owing to continued wet weather at the time they commenced to ripen. Later varieties, such as Laxton's Latest (1904) and Waterloo, promise well; Pears are plentiful on wall and pyramid-trained trees, and they are swelling well. The Pear midge has not been so troublesome this season as in former years; persistently picking and burning the infested foliage no doubt accounts for this. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NOTTINGHAMSHIRE.—Fruit trees had a large quantity of bloom this season, and the promises for a good harvest could scarcely have been better, but the cold, wet weather prevented most of the Apples and Strawberries from setting. Some few varieties of Apple trees, such as Lord Grosvenor, Ecklinville Seedling, &c., are laden with fruit, whilst late varieties, such as Bramley's Seedling, are almost a failure. No bees were working during the time the trees were in bloom. Strawberries are almost a total failure in many places. Cherries set freely, but many have since fallen off. *J. R. Pearson & Sons, Lowdham, Notts.*

OXFORDSHIRE.—Strawberries were not equal in quality to those of past years, and many of the berries were quite spoilt by the continued wet weather. Raspberries, Black and Red Currants, and Gooseberries are plentiful and of fine quality. Apple trees are very badly infested with blight, but Pear trees are healthy and are growing vigorously. Peaches set freely, but the new growths are weak. Cherries were formed freely, but many have dropped. The wet, cool weather of the past season has suited the crops in this garden, the soil of which consists of a light loam on gravel and chalk. *John A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

— The late spring frosts and a long spell of cold weather when Apple trees were in full

bloom have ruined this crop. Even the foliage of Apple trees was much injured through these causes. Plums are a very heavy crop, and so numerous that many cannot possibly come to perfection. The weather last season being warm and dry, it favoured the ripening of shoots on Peach and Apricot trees out-of-doors, and this probably accounts for the heavy crop of these fruits. Pears are never a success with us. Cherries at one time promised to be a record crop, but excessively cold weather prevailed when the trees were in bloom, and the untoward weather also affected the Strawberry crop. Our soil is very stony and of a poor quality. The sub-soil is chiefly of clay. *A. J. Long, Wyfold Court Gardens, Reading.*

SHROPSHIRE.—Apples generally are an average crop, though some trees are sparsely fruited. Our best varieties this year are Bramley's Seedling, Cox's Orange Pippin, Lord Suffield, King of the Pippins, Tom Putt, Lane's Prince Albert, Pott's Seedling, Gascoyne's Scarlet Seedling, and Keswick Codlin. Plums and Damsons are remarkably plentiful. Strawberries rotted badly on the plants. Raspberries are good and clean. Our soil consists of a light sandy peat, and rests mostly upon a gravelly sub-soil and occasionally upon sand. *A. S. Kemp, Broadway, Shifnal.*

— The soil in these gardens has been improved; naturally, it is very shallow and of a poor, black, peaty nature, on a sub-soil of sand or a bastard rock, which is most injurious to the roots of trees, so that they invariably perish when they penetrate into it. The best varieties of Apple trees are short-lived, and produce fruits of inferior quality. Pear trees against walls planted in made borders produce better results. Plums succeed well here. All trees this spring showed an abundance of bloom. Apple trees are carrying good crops of fruit, but the shoots are badly infested with blight. Pears set well, but the Pear maggot destroyed more than half the crop; this pest is on the increase, though we combat it every season. Peaches and Apricots are plentiful, but small, and they will be very late in ripening. I am doubtful if many late Peaches will ripen. Bush fruits are good crops, but backward. Strawberries were largely spoilt by the excessive wet, and they were very late in ripening. *John Taylor, Hardwicke Grange Gardens, near Shrewsbury.*

STAFFORDSHIRE.—During their flowering period all kinds of fruit trees gave promise of full crops, but the continued cold and sunless weather experienced during the time the Pear, Plum, and sweet Cherry were in flower prevented the ripening of the pollen, and this accounted for the non-setting of a great many of the fruits. The fruits on the later varieties set freely, and the trees are carrying fair crops. Apples, with a few exceptions, are plentiful. Strawberries promised well when in bloom, but the continued wet weather, to nearly the middle of July, was the reason of a large number of these fruits rotting, and from the same cause many of the flowers on later varieties failed to set. Walnuts, Cobnuts, and Filberts are thin crops. The soil is a cold, stiff loam on a sub-soil of clay. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

WARWICKSHIRE.—Of Apples, it may be recorded they are again a failure. The flowering of the trees was everything that could be desired, and the failure is due to the continued cold weather at the time of blossoming. Visiting Barston Hall near here, I found the trees of an avenue of Bramley's Seedling, which generally produce a fine crop of fruits, with a solitary exception, entirely barren. A tree of Worcester Pearmain in the same orchard showed a good crop. Pears are much better, and some trees are furnished with abundant fruits. Of Plums and Damsons in this orchard, the crops are exceptionally heavy and good. Cherries, too, are plentiful. Peach, Nectarine, and Apricot trees on walls are also well fruited. Small fruits are everywhere plentiful and good. But five acres of Walnut trees are absolutely without fruits. Filberts, too, are scarce. The above remarks are also applicable to other gardens and orchards in this neighbourhood, and also of many trees in cottage gardens. I recently visited the Knowle Fruit Farm of about 40 acres, belonging to Mr. Tangye, and on asking this gentleman as to the condition of his fruit crop, he replied "Bad." The trees, however, were making good

growths. Mr. Tangye informed me that in future he intended to pay more attention to the matter of spraying. This precaution may kill aphides and mildew, but against damage by frost there is, unfortunately, no effective remedy known. *W. Miller, Berkswell.*

(To be continued.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE FLORA OF PALESTINE.—I must confess myself as quite unable to follow your reviewer's note. But, perhaps, I may be permitted to state what appear to me to be the most probable conclusions of modern criticism on the subject. 1. The true reading of the word translated Lign-Aloes in the Bible, almost certainly means terebinths and not tents. 2. The Aloes of other passages was not the medicinal drug, but Eagle-wood, which in this case was, I think, the product of *Aquilaria malaccensis* from S. Tenasserim. A full discussion would be too technical for your columns, but those who care to follow it may consult the article Aloes in the *Encyclopædia Biblica*, and that on Eagle-wood in Yule and Burnell's Glossary of Anglo-Indian words. *W. T. Thiselton-Dyer.*

EREMURUS ROBUSTUS AND OTHERS.—It is well to remind cultivators of these splendid plants that September is a suitable month for transplanting them. Great care should be exercised in handling the root-mass, for the spreading roots are easily broken. The plant needs a well-manured soil, and one that is well drained. The crowns should be placed about 8 inches beneath the surface of the ground, and a mulch of fine coal ashes or half-decayed leaves should be placed over them after the soil is frozen. It is advisable not to remove this protection too early in the spring-time, as late frosts are apt to injure the young shoots. *F. M.*

ARGEMONE GRANDIFLORA.—*A. grandiflora*, or more properly *A. mexicana*, though usually considered an annual, has been perennial in a warm and fairly dry border in my garden since I brought seeds from Mexico in 1888, but it has never attained anything like the dimensions given by Mr. Fitzherbert in his note on p. 113. After seeding freely it dies completely down every autumn. It was a cornfield weed in Mexico, and I found a plant, which cannot be distinguished, growing under similar conditions in Chile. This plant was apparently lost, or so rare, that it was unknown to most gardeners when I first raised it, though it was well figured in Sweet's *British Flower Garden*, 111, t. 226, as long ago as 1827 or 1828. I have given seeds to so many people that it should now be common. What is often grown under this name is *Argemone ochroleuca*, a Mexican plant with smaller, pale yellow flowers and quite different leaves, figured by Sweet in t. 242 of the volume already mentioned. *H. J. Elwes, Colborne.*

TIME FOR SOWING SEEDS OF CYCLAMEN.—While many growers of Cyclamen sow the seeds in November and cultivate the plants for two years, I am not giving a trade secret away when I say that some up-to-date nurserymen sow their seeds about August and flower the plants in the following season. Seed should be sown thinly in pots or boxes, over which should be placed a sheet of glass or paper. The young plants will require to be pricked into small pots as soon as the first leaf has fully developed, and they should be cultivated in a rather warm, moist atmosphere until early in the spring, when they should be ready for another shift into 3-inch pots. Towards the end of May or early in June they should be potted into 5-inch pots, and they will flower in this size very well, although a further shift early in July to a 6-inch or 7-inch pot would produce plants of a larger size. The secret of obtaining good plants in this short space of time lies in keeping the plants growing by repeatedly re-potting them. When the weather becomes warmer in spring the plants should be kept cooler, and in hot weather be afforded shade from sunshine, and an abundance of air. Now that there are flowers with such fine salmon shades, the Cyclamen is one of our best winter-flowering plants. *Z. J. C.*

GLADIOLUS GANDAVENSIS.—These bulbous plants should now be in fine bloom. Those we grow now as hardy Gladiolus are chiefly crosses between *G. cardinalis*, *tristis*, *blandus*, *carneus*, *inflatus* and *angustus*. The late Dean Herbert said that in his garden at Spofforth they bloomed at about the same time as the Roses. They succeeded best when he grew them in close tufts, which with the old skins of the decayed bulbs, permitted the moisture to drain away and prevented the soil from pressing too heavily on the corms in autumn and winter. Such tufts remained undisturbed for many years, but needed to be covered with leaves from November to March or April. If it is necessary to divide the clumps, it should be done late in the autumn, the corms being potted, and kept in a cold pit until spring when they may be turned out into the border; or it may be done in April. F.

ONOPORDON ACANTHIUM (the Cotton Thistle).—A plant of this species is growing in the pleasure grounds at Hatley Park, near Sandy, the seat of Sir Charles Hamilton, Bart. Its height is 12½ feet, and in circumference it measures 27 feet. It carries more than 400 flower buds. Some of the flowers began to expand at the latter part of July, and the plant appears likely to continue to bloom for some weeks. The seeds were received from India, and were sown in rich soil in November, 1905; they were given a mild bottom heat to encourage quick germination, being afterwards transferred into 5-inch pots. Subsequently they were hardened off and planted out in strong loamy soil in their present position. I think there will be no difficulty in getting the flowers to set, as the bees are at work on them all day long. The best position for such a plant is in the sub-tropical or wild garden. Rabbits would not interfere with them, as the spines are very sharp. The foliage is attractive, being of a lightish colour and woolly on both surfaces; the flowers are purple. T. W. Birkinshaw. [An illustration of this species was published in the *Gardeners' Chronicle*, September 16, 1905, p. 219.—Ed.]

THE BUNCH PEAS.—Whilst this so-called Mummy Pea owes much of the interest which is attached to it, to the romantic stories told concerning its association with mummies, and to its odd appearance as compared with normal edible Peas, yet it has some charm of its own. I saw it recently in a cottage front garden at Lingfield, Surrey, where plants some 4 feet in height, carrying large heads or bunches of flowers, were quite charming objects. The flowers resembled those of the old variety Painted Lady, and were red and white. I have thought if some of our expert hybridisers in Sweet Peas would turn their attention to such species as this Bunch Pea, and to the better known twin-flowered Lathyrus, they might raise some hybrids that would possess features hitherto unknown in the Lathyrus family. If this Bunch Pea, for instance, could by hybridisation be induced to materially shorten its stout and somewhat fasciated stem, and to assume a more branching habit, a very pretty garden plant might be obtained. Again, if it were possible to have some of the variety, sweetness, and beauty of *Lathyrus odoratus* in *Lathyrus grandiflorus*, what a remarkable race of perennial Peas might follow. Can anyone tell us of the native habitat, species, and origin of this Bunch Pea? I have looked in vain for mention of it in *Vilmorin's Vegetable Garden*, but presumably it is well known at Kew. Also could we be informed as to how the "Mummy" legend first grew up? A. D.

[In the *Gardeners' Chronicle* for August 14, 1847, p. 542, appeared a note from a correspondent who had purchased from a Mr. Grimstone a sealed packet containing five seeds of the Mummy or Crown Pea, for which he paid five shillings. The plant was first figured in these pages on January 11, 1873, pp. 44-45, and in connection therewith a note by the late Mr. Barron was published. The origin of the Crown Pea was declared to be unknown, but it was described as possessing the following synonyms:—Bunch Pea, Cluster Pea, Mummy Pea, Royal Belshazzar, Pois Couronné, Pois Turc, and Pois Paquet; probably also Grimstone's Egyptian Pea. It was also said to be a distinct variety of the common garden Pea (*Pisum sativum*). In Nicholson's *Dictionary of Gardening*, the Crown Pea is described as a variety of *P. umbellatum*,

and in the *Index Kewensis* *P. umbellatum* is described as synonymous with *P. sativum*. At Kew, however, the Crown Pea has been found to be a variety of *P. elatius*. The following is a quotation from the *Kew Bulletin* for 1894, p. 371:—"Mummy Pea.—A very curious Pea, of which the Director obtained seeds from Messrs. Thomas Sutton, of Eastbourne (who stated that it had been brought from Egypt by the Hon. Charlotte Ellis), under the above name, has flowered at Kew this summer. . . . The seeds much resemble those of the wild *Pisum elatius* of the Mediterranean region. Similar fasciated forms of the Pea are figured by Tabernaemontanus in his *Herbal*, published in the year 1590, on page 495, and are described by Philip Miller in the eighth edition of his *Gardeners' Dictionary* (1771), under the name of *Pisum umbellatum*, Rose or Crown Pea. The native country of *Pisum sativum* and *P. arvense* has never been satisfactorily ascertained. It is not unlikely that they may be both cultivated races derived from *P. elatius*, which extends in a wild state from France to Western Asia. The name 'Mummy Pea' is equally applied to the non-fasciated form. (See *Garden*, 1894, Vol. II., p. 118.)" Mr J. G. Baker has obligingly written us confirming the opinion expressed in the *Kew Bulletin* that it is a variety of *P. elatius*.—ED.]

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

AUGUST 8.—*Present*: E. A. Bowles, F.E.S., F.L.S. (in the chair); Messrs. C. Shea, W. Cuthbertson, J. T. Bennett-Poe, J. Douglas, E. M. Holmes, and F. J. Chittenden (hon. sec). Visitor, Mr. C. E. Grosvenor, of Berkeley, California, U.S.A.

Chlorosis in fruit trees.—MR. SPENCER PICKERING, F.R.S., wrote as follows regarding this subject, which was before the committee at their last meeting:—"In one district where the trouble is very prevalent the soil contains as much as ten per cent. of lime. Deficiency of lime, therefore, cannot be the cause of the disease."

"Yellow Stripe" in Narcissus.—Some bulbs of Sir Watkin Narcissus were received, the foliage and flowers having been affected with the well-known "yellow stripe." The cause of this disease is still obscure, but it appears to follow from too heavily manuring the soil in which the plants are grown. Mr. BENNETT-POE and Mr. DOUGLAS stated that if the plants were cultivated in soil not manured for a time they would recover, but only after a considerable period, and the attempt to cure the plants was hardly worth while in the cheaper varieties.

Curious growth on Broom.—MR. HOLMES showed a branch of Broom which had been drooping downwards, and had sent out from its tip numerous thin shoots much crowded together and growing almost erect. The parent branch had become thickened just at the point at which the branches had been produced.

Crinum augustum.—A splendid inflorescence with foliage of this *Crinum* was shown by Sir TREVOR LAWRENCE. The plant is figured in *Bot. Mag.* (1823), No. 2397.

Plymouth Strawberry.—MR. CHITTENDEN showed on behalf of Mr. R. Lindsay, a specimen of the Plymouth Strawberry from the gardens of Mr. Fraser, Comely Bank Nurseries, Edinburgh. This curious Strawberry was first described by Tradescant, and is referred to in Johnson's edition of Gerard's *Herbal*; it was figured by John Parkinson. Dr. Masters refers to it in *Vegetable Teratology* as "a kind of Botanical Dodo," as it was not heard of for about a century, but was afterwards discovered again at Bitton in Canon Ellacombe's garden, and by Mr. G. F. Wilson at Wisley.

Peloric Antirrhinum.—MR. CHITTENDEN showed, also from Mr. Lindsay, a specimen of *Antirrhinum* with regular flowers, the peloric condition being complete in all the lower flowers of the spike, while some of the upper flowers were returning to the irregular condition. The peloric condition has now become fixed, but the form cannot be depended upon to come true from seed.

Floral Committee.

TRIAL OF CANNAS AT WISLEY.

JULY 30.—One of the trials at Wisley this season in which the Floral Committee is interested is that of Cannas. In one of the large span-roofed houses, having two divisions, there are nearly 500 plants under cultivation, and these represent about 200 varieties, all of which are new, or, being already well known, are still considered to possess merit equal to the best. Most of the specimens are in pots measuring 10 inches in diameter, some are larger, others rather smaller. The cultivation could not be better, each specimen being sturdy in growth, of perfect development in respect to foliage and flowers, and free from any trace of disease or pest. The varieties presented for inspection are, therefore, to be seen in the very best condition possible. Those interested in Cannas, and who have the opportunity, may be recommended to go to Wisley and see the collection for themselves, as the plants will continue in good flower for some time to come. All who see the collection will doubtless be impressed with the evidence it affords of the great improvement that has taken place in Cannas generally. When we remember that in our own experience Cannas were cultivated rather for their handsome foliage than for their flowers, and for the habit that made them suitable plants for associating with other species in what is termed sub-tropical gardening, the present race is the more remarkable. The good habit has not been destroyed, neither has the foliage become less attractive, but the cross-breeder has effected a wonderful improvement in the flowers. The best Cannas are now excellent flowering plants for cultivation in large pots or tubs, or for planting in summer in prominent and sunny positions out-of-doors. They are not so satisfactory out-of-doors, however, except in the most favoured districts. In any case, the plants need the warmest position that can be afforded them, and it is important that they should be sheltered from winds.

The first inspection by a sub-committee took place on July 30, when the following varieties were awarded three marks. No Awards of Merit could be given, because the members present were insufficient to constitute a quorum.

Some of the new varieties were under numbers only, the raiser (Pfizer) being expected to forward the names. Such were "850," with rose-coloured flowers, green foliage, and showy flower truss; "861," with orange-scarlet-coloured flowers, the centre segments being yellow; "1500," a white and cream-coloured variety; "848," crimson; and "874," rose-coloured.

C. "Uncle Sam."—Red or rosy-crimson-flowered variety, the individual blooms being of excellent form. Habit tall.

C. *President Meyer*.—Also an orange-red coloured flower, but with purple, instead of green, foliage. This variety having previously received an award, the award was confirmed.

C. *Burbank*.—A good yellow variety with red spotting, foliage green.

C. *Grössherzog*.—The flowers are orange-scarlet with faint spotting.

C. *Ernest Ludwig*.—A variety which had already received an award, now confirmed.

C. *Oskar Dankerer*.—Previous award confirmed.

C. *Pluto*.—This yellow variety had previously received three marks.

C. *Wyoming*.—An excellently-formed flower of orange yellow colour, tinted like a well-coloured Apricot fruit. The plant was 3 feet high, and the foliage purple.

AUGUST 13.—The second inspection took place on Tuesday last, when the following members of the Floral Committee were present at Wisley:—W. Marshall, Esq., chairman; and Messrs. George Nicholson, James Douglas, W. Bain, C. T. Druery, J. Jennings, James Hudson, T. W. Turner and R. Hooper Pearson.

Awards of Merit were made to the following varieties:—

C. *J. B. van der Schoot*.—A clear yellow flower with red splashes and spots. The form of the individual flowers is not of the best, but the variety has a large, bold spike of many

flowers, and the variety is one of the best decorative plants.

C. Elizabeth Hoss.—Also a yellow variety, with bright red spotting and green foliage. Previous Award of Merit confirmed.

C. Gladiator.—The best spotted variety in the collection. The ground colour is yellow, and the spots red, but the particular feature of the flower is the rich red-coloured segments in the centre. The foliage is green.

C. W. Saunders.—A good rosy-crimson variety with purple foliage.

C. William Bofinger.—The flowers are orange-scarlet, and the foliage green.

C. Uncle Sam.—The award of three marks, made at the earlier inspection, was raised to an Award of Merit.

The following varieties were under numbers only:—"850," the award of three marks was raised to an Award of Merit. "626," flowers orange-red, foliage purple. "1506," a

award was also made to Albatross (white) as for an excellent "garden" Pea, being extremely decorative and apparently always three or four-flowered. Also to the variety Mrs. C. Foster, which has an erect, almost fringed standard. The flower is of shades of rose and mauve.

Among the perennial, or shrubby Phloxes, the variety Gruppenkönigin was selected to receive an Award of Merit. The plant is an extra strong grower, and the flowers are pink.

VISIT OF FRUIT COMMITTEE TO WISLEY.

To examine a trial of Melons, conducted this season in one of the long span-roofed houses at Wisley, a sub-committee of no fewer than 12 members of the above committee visited the gardens on Friday, August 9. The members present included Mr. G. Bunyard, chairman, and Messrs. O. Thomas, W. Bates, W. Poupart, G. Woodward, J. Vert, A. M. Allan, H. Parr, A. Dean, J. Jacques, C. Foster, and G. Reynolds.

which is also a white-fleshed Melon. This variety has previously been certificated, and that award was unanimously confirmed. The green-fleshed Melons included the old William Tillery, long since certificated, and it was found to be of so excellent a quality the award in this case was also confirmed. Also Ringleader, not quite ripe, but still excellent; Eastnor Castle, an old variety still sufficiently good as to secure an Award of Merit; Windsor Castle, rich in flavour but not quite ripe; and Advance, new, which also received an Award of Merit. Only three scarlet-fleshed varieties were set aside for a final tasting; of these, Blenheim Orange readily had its previous award confirmed. Sutton's Scarlet proved to be the best of its section; it is of fine flavour, and the variety was unanimously voted a First-Class Certificate. An Award of Merit was granted to the variety Empress, also for its excellent flavour. It is probable that a fine collection of the best fruits from this trial will be staged at the next meeting of the committee at Vincent Square, on the 20th inst., when any kinds not tasted at Wisley will be judged. As to appearance, whilst all the fruits were handsome, special admiration was bestowed upon the fruits of Perfection, and also upon those of Royal Sovereign.

The committee next examined a trial of dwarf French Beans, but no variety called for special notice. Rows of early Potatos were also inspected, there being an extensive collection of this vegetable. Previous awards made to May Queen, Harbinger, and Ideal, all of which varieties were giving good crops and handsome samples of tubers, were confirmed. A very handsome and free-cropping Potato was noticed in the Colleen, an Irish variety, and this the committee selected for a cooking test at an early date. Others selected were the very handsome, free-cropping, red Kidney Cardinal, raised at Bedford more than 20 years since, Leonardslee Favourite, and Sutton's Favourite. The old Early Regent was good, and its previous award was confirmed. Sir J. Llewellyn and Midlothian Early gave excellent, clean samples of tubers.

NEWBURY HORTICULTURAL.

AUGUST 5.—The 59th annual exhibition of the above society was held in Goldwell's Park on this date. The park is an ideal spot for the holding of a flower show, and the exhibition was visited by a numerous company, including the Mayor and Corporation. The competition this year in many of the classes was exceptionally keen, and rarely has such an array of Grapes been seen. The exhibits of cut flowers and of vegetables were of splendid quality.

GROUPS.

The premier award for a group of greenhouse plants was secured by Mr. J. Howard, gardener to Lady SUTTON, Benham Park, Newbury. 2nd, Mr. F. Lock, gardener to G. J. PLEVIN, Tilebarn, Woodhay. The best exhibit of foliage plants was also shown by Mr. HOWARD, and he had the best groups of exotic Ferns. Mr. C. Ross, gardener to Col. ARCHER-HOUBLON, Welford Park, Newbury, was awarded the 2nd prize for foliage plants.

Fuchsias are a great feature at this show, and those staged on this occasion were splendid examples of good culture. The best plants were 8 feet in height, and were shown by Mr. T. SURMAN. 2nd, Mr. P. Mara, gardener to Lady ARBUTHNOT, Newtown House, Newbury, with smaller plants.

CUT FLOWERS.

Lady SUTTON exhibited magnificent blooms in the Rose classes, and won the 1st prize in an important competition, Messrs. COX and SMITH being 2nd and 3rd respectively. The best Sweet Peas were shown by Mr. Smith, gardener to H. A. EVANS, Esq., Newbury. Mr. G. B. CLARK had the best exhibit of herbaceous flowers.

FRUIT.

Grapes, as previously stated, were very finely shown; indeed, so strong was the competition, that extra awards were given. The premier award for a collection of fruits was secured by Mr. F. Lock. He showed Grapes, Peaches, Nectarines, Melons, &c. 2nd, Mr. G. H. Clark, gardener to Mrs. WATERHOUSE, Yattendon, Newbury. Mr. MARA had the best Black Hamburg Grapes; Mr. TAYLOR, the best of any other black variety. Mr. LEES won in the class for

FIG. 52.—A POT-PLANT OF BLACK ALICANTE GRAPE TWO YEARS OLD. Exhibited by Messrs. J. Veitch & Sons, at the R.H.S. meeting (see p. 117).

very dwarf plant with rose-coloured flowers and purple foliage. "848" (the best crimson variety), three marks, now raised to Award of Merit; and "1500," previous award raised to an Award of Merit.

A variety that narrowly failed to get an award was "Duke of York," a fine magenta-coloured flower, with a narrow yellow band on the margin of each segment—a Picotee type of flower. This variety deserves high recommendation.

SWEET PEAS AND PHLOX.

At the two inspections noticed above the Sweet Peas and Phloxes were examined. It was decided to bracket the following varieties of Sweet Peas as being too much alike:—Paradise, Enchantress, and Florence Spencer. Brilliant Blue and Lord Nelson were also bracketed, and three marks awarded the variety. A similar

There were 26 plants, and each was carrying either three or four finely finished fruits, the majority having the latter number. The committee expressed in warm terms their high appreciation of the culture seen in connection with the trial. The seeds were all sown on the same date in the middle of May. The committee first inspected the varieties, and noted their cropping and other qualities. The ripest fruits only were gathered and tasted. They were then put into their respective sections of scarlet, green, and white flesh, those showing good quality only being thus reserved. A third tasting took place, with the result that the richest flavoured fruit of all was declared to be the white-fleshed Diamond Jubilee. A First-Class Certificate was unanimously awarded this variety. Diamond Jubilee was closely followed in point of quality by the variety Countess,

Muscats, and Mr. G. H. CLACK in that for Madresfield Court. Messrs. LOCK and HOWARD were the principal winners in the other classes for fruit.

VEGETABLES.

Messrs. Sutton, Reading, offered prizes for a collection of vegetables, and the class was splendidly contested. Mr. J. HOWARD surpassed all other competitors in his Magnum Bonum Cauliflowers, Ailsa Craig Onions, Best of All Peas, Al Tomatos, New Intermediate Carrots, and Factor Potatoes. 2nd, Mr. T. SURMAN.

There was great competition in the amateurs' and cottagers' classes for vegetables, and some splendid produce was seen.

MIDLAND CARNATION AND PICOTEE.

AUGUST 8 AND 9.—Owing to the very late season, the annual show of this society, which is always held in the Botanical Gardens, Edgbaston, Birmingham, was postponed from July 31 and August 1 to the above dates. Notwithstanding the alteration, the season proved too early for some exhibitors. The show was an exceedingly good one, both as regards the quality and quantity of exhibits. The old-fashioned florist's method of showing Carnations in paper collars still finds supporters, but the undressed flowers shown as grown, with their own foliage, are gaining favour with the public, and, judging from the increased number of entries in the classes provided for them at Birmingham, exhibitors are increasingly availing themselves of this manner of displaying their flowers. The

man were of perfect shape, size, and finish. 2nd, Mr. C. F. THURSTAN, Wolverhampton, with excellent examples of Daffodil. Mrs. Eric Hambro, Sir Bevy's, Mrs. Flight, &c. 3rd, Mr. R. G. RUDD, King's Norton.

Yellow-ground Picotees.—In this class, for 12 yellow-ground Picotees, Mr. HAYWARD MATHIAS, Medstead, was the winner. His blooms were large and shapely, especially those of Togo, Mrs. W. Heriot, Gamma, Chryseis, and Lauzum. 2nd, Mr. C. F. THURSTAN.

Fancy Carnations.—In a class for 12 Fancy Carnations, Mr. C. F. THURSTAN beat six competitors with flowers of surprising merit. The varieties were Elaine, Douce Davie, Merlin, Sam Weller, Margaret Thurstan, Highfield Lass, King Solomon, King Solomon (sport), R. A. Rowberry, Galileo, Canatrice, and Hanno. 2nd, Mr. A. R. BROWN.

White-ground Picotees.—In the classes for 12 white-ground Picotees and 12 Flakes or Bizarres, Mr. C. H. HERBERT, Acocks Green, won both 1st prizes with refined flowers. Mr. A. R. BROWN and Mr. C. F. THURSTAN won the 2nd prizes.

Self Carnations.—In the class for six Self Carnations, Mr. G. D. FORD, Acocks Green, beat 16 other competitors with a stand of superb flowers of Bridegroom, Sir Galahad, Sir Bevy's, Mrs. M. V. Charrington, Glowworm, and Mrs. Eric Hambro. 2nd, Mr. G. F. SPITTLE, Solihull.

In the small classes provided for yellow-ground Picotees and Fancy Carnations, the

being of the highest quality. 2nd, Rev. C. A. GOTTWALTZ. 3rd, Mr. G. D. FORD.

Mr. JAMES FAIRLIE, Acton, won in the class for six Flakes or Bizarres. 2nd, Dr. A. H. BEADLES, Sydenham.

UNDRESSED FLOWERS.

Self Carnations. In the class for 12 dissimilar varieties, the exhibits in which were dis-

FIG. 54.—GOOSEBERRY LORD DERBY TRAINED AS A TRIPLE CORDON.

Exhibited by Messrs. J. Veitch & Sons (see p. 117).

played in vases on tier staging, occupying an area of 24 inches by 20 inches, there were six contestants. The schedule required that no wire be used, except a mere support, which must not come beyond the base of the calyx. Mr. W. H. PARTON was placed 1st with handsome specimens of Daffodil, Sir Bevy's, Britannia, Bridegroom, Sappho, W. H. Parton, Sir Galahad, Lady Hermione, Hildegard, Helen, The Sirdar, and Cassandra. 2nd, Mr. A. R. BROWN. 3rd, Mr. R. G. RUDD.

Mr. W. H. PARTON also gained the premier position in a class for 12 Fancy or yellow-ground Carnations of dissimilar varieties. 2nd, Mr. A. W. JONES, and 3rd, Mr. A. R. BROWN.

In a similar but smaller class to the last-named, Mr. H. SKEELS, Walsall, beat the Rev. C. A. GOTTWALTZ. There were 10 exhibits in this class.

In the class for six Self Carnation flowers, the 1st prize was awarded to Mr. G. D. FORD, whose flowers, with the exception of Sir Galahad, were in splendid condition. 2nd, Mr. J. D. WILLIAMS, Smethwick.

FLOWERS SHOWN IN TREBLES.

Treble Selfs, yellow-ground Picotees, or Fancies, dissimilar.—Of the six competitors in

FIG. 53.—PALMATE-TRAINED PLANT OF GOOSEBERRY LANGLEY BEAUTY.

Exhibited by Messrs. J. Veitch & Sons at the last meeting of the R.H.S. (see p. 117).

weather was fine on both days of the show, which was well supported by members and the public.

DRESSED FLOWERS ON STANDS

Self Carnations.—The best 12 varieties in the premier class for Self Carnations came from Mr. A. R. BROWN, King's Norton, whose flowers of Cecilia, W. H. Parton, Ensign, Comus, W. Brearley, Helen Gottwaltz, and Cardinal Wise-

Rev. C. A. GOTTWALTZ, Hadzor, Droitwich, won the premier prize with exquisite flowers. Mr. A. W. JONES won the 2nd prize in the first, and Mr. G. D. FORD the second in the last-named class.

White-ground Treble.—In the class for six flowers, the best among 12 exhibits was shown by Mr. F. W. GOODFELLOW, Walsall, who showed very handsome flowers, every specimen

this important class, Mr. W. H. PARTON gained the 1st prize with magnificent flowers of Sappho, Voltaire, R. A. Rowberry, Ivo Sebright, Gronow, Sir Galahad, King Solomon, Lucifer, Merlin, W. H. Parton, Hildegard, and Galileo. 2nd, Mr. R. G. RUDD, with beautiful flowers of fresh appearance, but they were not so effectively staged as those of the 1st prize collection. 3rd, Mr. A. R. BROWN.

In the similar but smaller class for six flowers, Mr. J. D. WILLIAMS was awarded the 1st prize for an excellent stand of flowers containing Merlin, Ivo Sebright, Mrs. Walter Heriot, &c. 2nd, Mr. G. D. FORD. 3rd, Mr. C. CHATWIN, Handsworth.

White Carnations.—Mr. A. W. JONES staged the best vase of white Carnations (Sir Galahad), and he also showed the winning vase of a rose, salmon, or a scarlet-coloured variety in Glowworm, and the best vase of a yellow or buff-ground Fancy variety in Sam Weller.

Mr. C. H. HERBERT won the 2nd prizes in the first and last-named classes, and Mr. A. R. BROWN secured the second prize in the other class.

The best vase of a yellow Carnation (Daffodil), dark Self (W. H. Parton), and the best of a yellow-ground Picotee (Mrs. W. Heriot) came from Mr. W. H. PARTON.

AMATEUR SECTION.

Five classes were reserved for amateurs who do not cultivate more than 300 plants, and who do not employ a gardener continuously. All the classes in this section were keenly contested, and the flowers were of excellent quality.

Mr. E. J. PRICE, Bournbrook, won the Bronze Medal and four other prizes.

AWARDS.

First-Class Certificates were awarded to:—*Fair Maiden*, a light scarlet-edged Picotee from Mr. F. W. FLIGHT, Cornstiles, Twyford. *Togo*, a heavy red-edged Picotee, from Mr. H. MATHIAS, Medstead. *Carrie Goodfellow*, a heavy scarlet-edged Picotee, from Mr. F. W. GOODFELLOW, Walsall. *Acc of Trumps*, a yellow-ground Picotee, from Mr. A. W. JONES, Stechford. *Lady Douglas Galton*, a yellow-ground Picotee; *Maud Brown*, a white-ground Picotee, from Rev. C. A. GOTTWALTZ, Hadzor.

AWARD OF MERIT.

Queen of the Whites, a Tree Carnation, from Messrs. R. F. FELTON & SONS, London.

PREMIER FLOWERS (DRESSED).

Bizarre Carnation "Master Fred," shown by Mr. C. H. HERBERT; Flake Carnation "Sportsman," shown by Mr. C. H. HERBERT; heavy edge, white-ground Picotee "Mrs. Hoskier," shown by Mr. F. W. GOODFELLOW; light or wire edge, white-ground Picotee "Fair Maiden," shown by Mr. HAYWARD MATHIAS; heavy edge, yellow-ground Picotee "Togo," shown by Mr. H. MATHIAS; light edge, yellow-ground Picotee "Lady Douglas Galton," shown by Mr. A. R. BROWN; yellow-ground fancy Carnation, "Elaine," shown by Mr. C. F. THURSTAN; Self Carnation "Mrs. Eric Hambro," shown by Rev. C. A. GOTTWALTZ.

PREMIER FLOWERS (UNDRESSED).

Self Carnation "Cantor," shown by Mr. H. SKEELS; fancy Carnation "King Solomon," shown by Mr. W. H. PARTON; yellow-ground Picotee "Mrs. Walter Heriot," shown by Mr. Mr. W. H. PARTON.

SPECIAL MEDALS AND PRIZES.—Four medals were offered by the BIRMINGHAM BOTANICAL AND HORTICULTURAL SOCIETY to the exhibitors gaining the greatest number of points in certain classes. The Silver Champion Medal was won by Mr. A. R. BROWN with 149 points in the large and single-bloom classes. Mr. C. H. HERBERT secured the Bronze Medal in the same classes.

The Rev. C. A. GOTTWALTZ (with 82 points) won the Silver Medal in the small and single-bloom classes, the Bronze Medal being awarded to Mr. G. D. FORD. The CARNATION SOCIETY'S Silver Medal, offered to the most successful exhibitor in the single-bloom classes, was taken by Mr. R. BROWN, who also secured a copy of Baines' *Stove and Greenhouse Plants*, and a copy of Hobday's *Villa Gardening* as the most suc-

cessful, all-round exhibitor. Mr. E. J. PRICE received the Bronze Medal and a copy of Hobday's *Villa Gardening* as the most successful exhibitor in the Amateur Classes. Mr. W. H. PARTON was the winner of a copy of Hobday's *Villa Gardening* in the undressed flowers. The four books were presented by Mr. WILLIAM ROBINSON.

Liberal prizes were offered by Mr. ROBERT SYDENHAM for Sweet Peas, and the principal prize-winners in these classes were: Mr. T. JONES, Ruabon; Mr. R. BARNES, Lichfield; Mr. E. DEAKIN, Hay Mills; and Mr. A. E. BUTLER, Edgbaston.

HONORARY EXHIBITS.

The non-competitive exhibits were much admired, and gave additional interest to the show.

Messrs. BAKERS, Wolverhampton, had a large assortment of hardy flowers, consisting principally of Phloxes, Liliums, Spiræas, Gladiolus, and Roses. (Silver-Gilt Medal.)

The space in front of the orchestra was furnished by Messrs. R. F. FELTON & SONS, London, with Carnations arranged in tall stands; also Richardias and pink, scarlet, and white Verbenas. (Silver Medal.)

Messrs. HEWITT & Co., Solihull, staged a large and interesting collection of hardy herbaceous flowers and sprays of hardy-flowering shrubs. (Silver Medal.)

Mr. A. F. DUTTON, Iver, Bucks., contributed a handsome group of cut Carnations in variety. (Silver Medal.)

Messrs. BLACKMORE & LANGDON, Bath, displayed a prettily-arranged group of double Begonias, including shapely flowers of Mrs. Portman Dalton, Professor Lanciana, Rt. Hon. Joseph Chamberlain, and Mrs. Booth. (Bronze Medal.)

Messrs. DAVIS & SONS, Yeovil, also showed a collection of cut Begonias. (Bronze Medal.)

Mr. W. SYDENHAM, Tamworth, contributed a well-arranged group of hardy flowers, in which were some very fine Carnations. (Bronze Medal.)

Messrs. RANDALL & SONS, Shirley, exhibited American varieties of Carnations and Liliums. (Bronze Medal.)

Messrs. DICKSONS, Chester, staged a large group of hardy flowers, in which were Phlox Eugene Danzanvilliers, Romneya Coulteri, Liliums, and Roses. (Bronze Medal.)

Messrs. GUNN & SONS, Olton, staged Roses in variety, and a choice collection of Phloxes. (Silver Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, sent a beautifully-arranged group of Sweet Peas. (Bronze Medal.)

ROYAL BOTANIC.

AUGUST 12.—The annual meeting was held on the above date in the society's gardens, Regent's Park. Mr. Pembroke Stephens, K.C., presided. In the 68th annual report the council stated that the society's indebtedness had decreased during the year from £34,402 to £33,374, and the debentures from £28,700 to £27,500. That Fellows of the society believed in it to the extent of £27,000 was a fact which spoke for itself as evidence of confidence in its management and in its future. A policy of redemption as to £6,000 of the debentures had been taken out, the surrender value being £235 in 1905 and £360 in 1906, the increase of £125 being also an increase in the society's assets. Subscriptions had amounted to £2,544 in 1905 and £2,551 in 1906. The amount received from fetes, exhibitions, and garden-parties had been £1,516 in 1905 and £1,525 in 1906. The society's scientific work had been carried on with consistent regularity and efficiency. The number of Fellows and others had fallen from 1,834 to 1,723. Nearly half the decrease was accounted for by deaths. The attempts to shake public confidence in the society had reached their climax during the year, but there had been ample evidence that a majority of the Fellows wished to place the income on a firmer footing. The council were anxious to adopt any well-considered proposals to improve the upkeep and usefulness of the gardens, but they were bound to resist repeated attacks based upon misconceptions or misrepresentations.

The chairman said that the gardens were, so far as they knew, the prettiest gardens of the kind in or out of London, and were kept up by the Fellows without any public grant for rates or rent. The society was ancient, Royal, and chartered, it was

doing an excellent work, and every visitor was pleased with the gardens, which were easy of access. The council had done all that was possible to investigate every ground of complaint. Looked at all round, he believed there was a very substantial advance in the society's position, and he hoped the Fellows would continue to support the council.

Sir Edwin Galsworthy seconded the adoption of the report. The opposition, he said, appeared to have dwindled from three to nothing. The council comprised men of business experience, and he felt that the antagonistic section of Fellows would not do the society any real good. The matter of the debentures had been put before them in a very misleading manner by certain Fellows, and the money certainly would not be pressed for if the agitation ceased. The increased subscription proposed by the council would have enabled them to pay off all the debentures in time.

The Duke of Teck was re-elected president, Mr. C. Brinsley Marlay was elected treasurer, and the eight retiring members of the council were re-elected.

The chairman said he recognised that there existed a feeling that the agitation had done some good; on the other hand, they had the falling off in the number of Fellows. They could draw a useful conclusion from this. An extra guinea subscription would extinguish in time the whole of the debentures, or the debenture-holders could hand them back to the society.

The report was adopted, five dissenting.

It was decided to send a vote of congratulation to Sir Joseph Hooker, who had been since 1873 an honorary member of the society, on his attaining the age of 90 years.

COMMONS AND FOOTPATHS PRESERVATION.

AUGUST 1.—Lord Eversley presided over the monthly meeting of the executive committee of the Commons and Footpaths Preservation Society, held on the above date, at 25, Victoria Street, Westminster. It was reported that the progress of the society's Public Rights of Way (No. 2) Bill continued to be opposed by a single member of Parliament, although the Bill had received the hearty support of leading representatives of all political parties, and was generally regarded as a non-controversial measure. It was resolved, upon the motion of Lord Eversley, seconded by Sir Robert Hunter:—

"That this society, being greatly impressed by the great benefits which would flow from the passing into law of the Rights of Way (No. 2) Bill and the Advertisements Regulation Bill, benefits which would operate, especially in rural districts, by preserving those field paths which are so largely used by the labouring population, and preventing the disfigurement of the countryside, and hearing that the Advertisements Regulation Bill has passed through all its stages in both Houses, and only requires the consent of the House of Commons to amendments made at the instance of the promoters in the House of Lords, while the Rights of Way Bill passed through the Grand Committee with the warm approval of members of all parties, earnestly begs the Prime Minister to give those advantages in procedure to both measures which at this period of the Session are necessary to enable the Bills to be considered on their own merits."

A communication was read from Mr. Haldane, M.P., the Secretary of State for War, stating that the War Office, after considering the report of the society's solicitor, Mr. Percival Birkett, upon the legal position of Eltham Common, had decided to abandon its proposal to erect officers' quarters upon the common. Exhaustive researches have been made into the history of Eltham Common, and the society is satisfied that although no rights of common have been exercised for some time, freehold tenements exist in respect of which such rights are appendant. Much satisfaction was expressed by the society at the decision of the War Office not to proceed with the threatened enclosure of part of a valuable Metropolitan common, and it was decided to urge the Department to give its consent to a scheme for the regulation of the land under the Metropolitan Commons Acts, on the understanding that the power to use the land for military purposes was reserved. It was also reported that the Birkenhead Corporation had agreed to the insertion of a clause in their Water Bill, now before Parliament, limiting their powers of acquisition to an easement only over common land in the County of Denbigh, to be utilised for reservoirs and pipes. The secretary, Mr. Lawrence W. Chubb, stated that during July upwards of 50 fresh cases of interference with footpaths and commons had been referred to the society for advice and assistance.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 25.—Committee present: E. Ashworth, Esq. (Chairman), and Messrs. Warburton, Ward, Cowan, Keeling, Parker, P. Smith and Weathers (hon. sec.).

A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), exhibited a group of plants, principally Odontoglossums, which were in great variety. (Bronze Medal.)

W. Thompson, Esq., Stone, Staffs. (gr. Mr. Stevens), exhibited a group of Cypripediums, principally hybrids. (Bronze Medal.)

Messrs. KEELING & SONS, Westgate Hill, Bradford, staged a group of miscellaneous plants. Some pleasing forms of Masdevallia were included in the exhibit, also a well-developed plant of Chondrorhyncha Chestertonii. (Bronze Medal.)

Mr. J. E. SADLER, Newbury, Berks, staged a dozen or more plants of Odontoglossums in variety. (Bronze Medal.)

J. MACARTNEY, Esq., Bolton, displayed a few good Cypripediums, as did also Mr. W. BOLTON, of Warrington.

AWARDS OF MERIT.

Chondrorhyncha Chestertonii and Cypripedium Elliottianum var. superbum shown by Messrs. A. J. KEELING & SONS.

Cypripedium Curtisii var. splendens displayed by W. THOMPSON, Esq., and C. X. Donald from the gardens of J. MACARTNEY, Esq., P. W.

THE SHREWSBURY SHOW.—We have received from Mr. W. W. NAUNTON, one of the honorary secretaries of the Shropshire Horticultural Society, an album of photographic views of some of the features of the horticultural shows which have been held in the old Shropshire town. All the illustrations in this *Souvenir of Shrewsbury Great Floral Fête* are excellent reproductions on art paper of photographs taken by Mr. NAUNTON himself, whose successful amateur photography is so well known to visitors to Shrewsbury. The illustrations include "A General View of Shrewsbury from St. Chad's Tower," "Champion Grapes," "The Champion Grape Vase, value £52 10s.," "Fruit Exhibit," "Collection of Vegetables," "Exhibit of Sweet Peas," and 20 other views connected with the fêtes, the Quarry grounds, and interesting features of the town. It is published at the low price of 3d., and may be obtained from Messrs. ADNITT & NAUNTON, The Square, Shrewsbury. Visitors to the town next week are recommended to procure copies of this well-executed little pamphlet, which contains, in addition to the illustrations, particulars of the charitable work that has been accomplished by the Shropshire Horticultural Society.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 14.

Day temperatures remarkably uniform.—Throughout the past week the maximum readings in the thermometer screen have been remarkably uniform, the lowest being 68° and the highest 71°, or a variation of only 3°. The nights were all more or less warm, and on the warmest of them the exposed thermometer did not fall below 57°—making this the warmest night as yet recorded here during the present year. Owing to the paucity of sunshine the ground still remains cold for the time of year, the reading at 2 feet deep being 29° colder, and at 1 foot deep 1° colder, than is reasonable. Rain fell on only two days, and to the aggregate depth of less than a quarter of an inch. No rain water at all has come through the percolation gauge on which short grass is growing, during the week, while only a few drops have trickled each day through the bare soil gauge. The sun shone on an average for 4½ hours a day, or for nearly 14 hours a day in defect of its usual duration in August. The winds were, as a rule, high, but in no hour did the mean velocity exceed 14 miles, direction W.N.W. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 12 per cent. E. M., Berkhamsted, August 14, 1907.

MARKETS.

COVENT GARDEN, August 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—ED.]

			Turnips (English), doz. bunches	2 0-3 0	
			Watercress, per doz. bunches	0 4-0 6	

REMARKS:—Plums from Kent are arriving in large quantities and record consignments are anticipated. English Apples and Pears are also obtainable. Home-grown Tomatoes have made a slight advance in value. The first shipments for this season of Australian Oranges and Californian Lemons ("Golden Drops") have been received. French Gages are much cheaper. Strawberries are now finished. P. L., Covent Garden Market, August 14, 1907.

POTATOES

Kents, 3s. to 4s. per cwt.; Bedford, 60s. to 70s.; Lincolns, 50s. to 70s.; Blacklands, 45s. to 50s. per ton. Supplies are large, but the demand generally is slow. J. D. C., Covent Garden, August 14, 1907.

COVENT GARDEN FLOWER MARKET.

Chrysanthemums of the Madame Massee type, in pots, are seen on several stands, but they are not disbudded and not good in quality. The Egg plant (*Solanum ovigerum*) is sent by several growers, and though not of much decorative value, it sells readily as a novelty. *Campanula isophylla* alba and C. l. Mayi are now very good, including plants with flowers fully expanded, and others with their first blooms just opening. *Verbenas* Miss Willmott, Scarlet King, and the white variety are seen in well-flowered plants. Up to yesterday morning *Pelargoniums*, including show, ivy-leaved, and zonals, were procurable in well-flowered plants. *Fuchsias*, *Heliotropiums*, *Chrysanthemum segetum*, *Hydrangea Hortensia* and *paniculata grandiflora* in various sized plants, *Lilium longifolium* and *L. laucifolium rubrum* are seen on several stands, but they do not sell freely. *Marguerites* are still abundant, especially those with white flowers. *Rose Dorothy Perkins* is still seen, but some of the blooms are far advanced. Plants of *Spiraea japonica* from retarded crowns are well-flowered. Bedding plants are still procurable. Single *Petunias* were noted on three stands on Tuesday (August 13); also small zonal *Pelargoniums*, *Calceolarias*, &c. Of Chinese *Asters* some are in pots and others are plants that have been taken up from the open ground. Trade for Ferns and other foliage plants is now very quiet.

CUT FLOWERS.

The market is overloaded with cut bloom. *Asters* are now very good from home growers; those of the Comet section are favourites. *Statice* of various sorts are over abundant. *Coreopsis*, *Gaillardias*, *Scabiosus caucasicus*, also the ordinary Sweet *Scabiosus*, in very pretty shades of colours; *Roses*, *Carnations*, Sweet Peas, *Gladiolus* and *Liliums* are all over abundant. *Gypsophila paniculata* is seen in heaps all round the market, and I noted some of a new double variety which does not come into bloom quite so early as the type. *Irises* are now over for the season. Sweet Sultan can be had in yellow and white flowers, both are extensively grown; the improved white variety is much appreciated. Iceland *Poppies* are still very good. *Tuberoses*, *Gardenias*, *Stephanotis*, *Lapageria alba*, and *Eucharis* are all well supplied.—A. H., Covent Garden, Wednesday, August 14, 1907.

GARDENING APPOINTMENTS.

Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received and acknowledged in these columns.

- Mr. G. A. HOLMES, for four years as Foreman in the gardens of H. WHITWORTH, Esq., Dunford House, Wath-on-Dearne, Rotherham, as Gardener to Colonel ORANGE BROMEHEAD, Newbold House, near Chesterfield. (One shilling has been placed in R.G.O.F. Box.)
- Mr. WILLIAM G. PAYNE, for the past 24 years Gardener to R. PALMER, Esq., Nazing Park, Waltham Cross, as Gardener to WALTER HARGREAVES, Esq., at the same place. (One shilling has been placed in the R.G.O.F. Box.)
- Mr. F. DEANEY, for the past six years Gardener to SIDNEY ROBERTS, Esq., Scotsbridge House, Rickmansworth, as Gardener to Mrs. FULCHER, Redenham House, Andover, Hants. (One shilling has been placed in the R.G.O.F. Box.)
- Mr. WM. GEO. COOMBS, for the past 12 months Gardener to Mrs. PILGRIM, Akeley Wood, Buckingham, and previously 7½ years with Mr. STERRY, Chapel Clewe, Washford, Taunton, as Gardener to Captain TRYON, The Manor House, Great Durnford, Salisbury.
- Mr. F. COOK, for three years Gardener to the late Mrs. ELEY, Oxhey Grange, Watford, Herts, as Gardener to F. HOBSON, Esq., The Prospect, Trowbridge, Wilts. (Thanks for contribution to R.G.O.F. Box.)
- Mr. W. G. GUISE, for the past five years Gardener to JAMES PORTER, Esq., Berthlywyd, near Conway, N. Wales, as Gardener to J. H. S. FULLERTON, Esq., J.P., D.L., Noblethorpe Hall, Silkstone, near Barnsley.

ANSWERS TO CORRESPONDENTS.

ADDRESS BOOKS: D. F. Thalacker's *Adressbuch*, published by Bernhard Thalacker, Leipzig-Gohlis, Germany. We have not a copy of a French gardeners' directory.

BOUQUET OF CUT FLOWERS: H. H. According to the terms of the schedule, any cut flowers could be shown, for annuals, biennials, and perennials were allowed. No provision was made to exclude bulbous plants. *Lilium dauricum* is a perennial. *Chrysanthemums*, *Delphiniums*, and shrubby *Phloxes* are also perennial plants. The schedule, like many others issued at local flower shows, is very loosely worded.

BLACK CURRANTS, RASPBERRIES, AND GOOSEBERRIES: Samuel. These plants are all gross feeders, and therefore require a liberal supply of plant food. Farm-yard or stable manure with moderate applications of superphosphate and kainit constitute the best stimulants they can be given. If sufficient natural animal manure cannot be obtained, then during the present autumn or early in winter apply to each square yard of soil around the trees a mixture composed of 6 ounces of superphosphate, 6 ounces of kainit, and 6 ounces of lime. In January or February next apply 8 ounces of Rape cake to each square yard of the soil around the trees and lightly

fork over the surface of the ground afterwards. If you can get any household suds, free from grease, you might give a liberal application of this liquid in showery weather during the month of March. Apply an extra dose of this liquid manure to the Raspberries, as these plants require a most liberal amount of moisture.

CARNATION SEEDLING: H. G. W. Striped or flaked varieties are common. Cultivate your plant for a season or two, and see if the flowers will improve in form and size.

CARNATION SPORTING: J. H. The variety you send has little or no value, being inferior to many already in cultivation.

COCCUS ON ELM-BARK: W. P. *Pseudococcus aceris* is the name of the insect on the Elm-bark. It is allied to the mealy bugs, but has not hitherto been recorded as really injurious, and judging from the comparatively few specimens present upon the piece of bark submitted we are of opinion that the sickly condition of the trees is due to some other cause. The insects can be destroyed by an application of paraffin emulsion or caustic alkali wash; but it is too late now to do any good as the larvæ are all hatched out from the white flocculent sacs and are probably feeding on the smaller branches. To be effective the wash should be applied soon after the white sacs are noticed on the bark, which is generally at about the beginning of July.

GRAPES STICKY: G. H. I. We cannot account for the presence of the sticky substance, unless it be a deposit from such insects as aphids.

GREEN PEAS TO PRESERVE: G. W. Take the Peas when they are just fully grown, but before they are old; shell them, throw them into boiling water and let them boil for 10 minutes. Drain well, and spread them out on tins. Put them into a cool oven once or twice to harden, then put the Peas into paper bags, tie the bags securely, and suspend them in a dry, warm room until wanted. Before using them, soak them in water for a short time and put one ounce of butter into the water in which they are boiled. Another method is to gather the Peas on a fine, dry day, open the pods on a large, clean cloth and leave the Peas for five or six hours exposed to the sun and air. Dry them gently in a rough towel, bottle them securely and in such a manner as to exclude air, or store them in a dry place.

HORSE CHESTNUT TREE: H. S. You cannot do better than cut it off very low and apply the acid occasionally.

LAND FOR VEGETABLES: H. K. You want to know what amount of land is required to produce a good supply of vegetables for a children's hospital accommodating about 250 persons, including staff. It is difficult to give anything like an accurate answer to this question, as so much will depend upon circumstances, such as the nature and suitability of the land, and its manuring, cropping and cultivation. However, we should say that four acres of good land would suffice, provided the ground is well manured, skilfully cropped, and given every attention that is necessary. Keep the crops free from weeds, and the surface soil stirred at intervals of a few weeks, between the rows of Carrots, Onions, Parsnips, French Beans, Scarlet Runners, Peas, Cabbages, Cauliflowers, &c., not only in order to destroy seedling weeds but also to stimulate growth in the various crops. As soon as the ground has been cleared of one crop it should be given what manure is considered necessary, and afterwards it should be dug or ploughed, and cropped again. Four acres will afford one rood to the supply of each 15 people, or thereabouts.

PEACH STONES SPLITTING: Enquirer. Either of the checks you mention will cause the stones to split. Excessive water at the roots is frequently accountable for the trouble. We do not know that the variety you mention is more susceptible to this injury than others.

PEAS: H. T. W. Your Peas are in a hopeless condition. The pods are attacked by the Bean Anthracnose, *Gloeosporium Lindemuthianum*. The base of the stem has been attacked by insects; and the foliage shows the advent of spots due to some hitherto undeveloped parasite. You should root up and burn all you can, disinfect the soil, and plant neither Beans nor Peas in the same soil for two or three years to come.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers. FRUITS: G. B. Raby Castle.—C. E. A. Immature Apples cannot be named with certainty. Send again later when the fruit is in season.—A. H. S. Myrobalan Plum.

PLANTS: J. U. *Verbascum Thapsus*.—T. H. *Rubus odoratus*.—G. C. 1, *Deutzia crenata*, double-flowered variety; 2, *Spiraea filipendula*.—N. S. *Chichorium Intybus*: the Chichory. —J. S. 1, *Oncidium luridum guttatum*; 2, *O. triquetrum*.—C. B. 1, *Alnus incana*; 2, *Viburnum dentatum*.—Horius. 1, *Spiraea Douglasii*; 2, *S. japonica*, callosa; 3, *Kalmia latifolia*; 4, *Centaurea macrocephala*; 5, *Lythrum salicaria*; 6, *Betonica spicata*.—A. B. 1, *Epidendrum indivisum*; 2, *Oncidium tetrapetalum*; 3, *Stelis micrantha*; 4, *Coelia bella*.—F. B. 1, *Calampelis (Eccremocarpus) scaber*. A useful outdoor climber.—H. J. D. *Eucomis punctata*. A Cape bulb, hardy in sheltered situations.—C. S. *Selaginella Wildenovii*.—L. H. 1, *Fumaria officinalis*; 2, *Aethusa Cynapium*; 3, *Erodium moschatum*; 4, *Calamintha officinalis*; 5, *Sedum rupestre*; 6, *Sedum Telephium*.—A. W. S. 1, *Ceanothus thyrsiflorus*; 2, *Spiraea Lindleyana*; 3, *Pavia macrostachya*; 4, *Solidago Virgaurea*; 5, *Achillea tomentosa*; 6, *Inula glandulosa*.—X. Y. Z. 1, *Hypericum Moserianum tricolor*; 2, *Verbascum nigrum*; 3, *Hypericum androceum*; 4, *Lilium chalcidonicum*; 5, *Lysimachia vulgaris*; 6, *Escallonia rubra*.—Fresco. 1, *Polystichum angulare* var. *proliferum*; 2, *P. aculeatum lobatum*; 3, *Lastrea Filix-mas*; 4, *Athyrium Filix-femina* var. *rheticum*; 5, *Aspidium Filix-femina* var.; 6, *Lastrea oreopteris*.—W. W. We do not undertake to name varieties of Carnations. The flower you send is probably *Cecilia*.—F. C. *Tradescantia virginica*.

ROSES ON IRON STANDARDS: L. W. K. Place a thin strip of wood up the support, and secure the growths so that they will come in contact with the wood only. In the case of chains, you should bind some cloth material around them at the places where the shoots will be fastened.

THE LOGANBERRY: T. M. The propagation and cultivation of this plant are generally similar to those required by the Raspberry. See a note on this fruit in our Calendar on the Hardy Fruit Garden, p. 129.

TWIN CUCUMBER: F. B. Such examples are not uncommon; we usually receive similar specimens during the season. The abnormality is caused by a fusion of two fruits.

VIOLAS DYING: F. O. The plants are attacked by a fungus disease. Spray the foliage with a fungicide, such as Condy's Fluid or sulphide of potassium— $\frac{1}{2}$ oz. to 3 gallons of water.

WEEDS: A Reader. The best plan is to burn them on the garden fire. They may also be destroyed by exposure to the air after they are uprooted. If the ground is trenched, the stolons can be removed as the digging proceeds, and be afterwards burned. We have never used electricity for destroying weeds. For information on the sterilisation of soil see an article which commenced on p. 129 in our issue for March 2, 1907.

DALTON HOLME, BEVERLEY.

DALTON HOLME, the residence of Lord Hotham, whose family have held the large estates in connection therewith for many hundreds of years, is situated some six miles from Beverley on the southern side of the Yorkshire wolds. The park that surrounds the mansion consists of some 400 acres of undulating land which is well furnished with trees, principally of Oak, Beech, and Elm. When the present Lord Hotham came into possession of Dalton Holme, about the year 1872, he decided to carry out extensive improvements in the mansion, home grounds, and gardens, and the advice of the late Mr. Broderick Thomas was sought, especially as to the development of the landscape on the farm lands outside the park.

Time has proved that on the whole, the improvements recommended by this expert were of a satisfactory character. The principal fronts of the mansion face eastward and westward. Leading to the east front is a carriage drive that is enclosed from the park by a very ornamental forecourt with gates at either

corner. On the western side of the mansion is the principal flower-garden, which takes the form of a sunken panel with a broad, well-kept gravel path surrounding the whole. The original design of this flower-garden has been much improved in recent years by reducing the number of the beds, dispensing with the intricate box-edging and small gravel paths that surrounded them, and by substituting turf as a base to the whole. Owing to the cold, unseasonable weather this season, the more tender bedding-plants were not well developed at the time of my visit, though it was easy to imagine that a little later the general effect would be very good. Begonias in groups of varieties of distinct colours were a prominent feature. Abutilons, Cannas, and other suitable plants were tastefully disposed as foils to dwarfer-habited flowering plants. Antennaria tomentosa was freely used for edging purposes. A number of clipped golden Yews were the best examples of topiary work the writer has seen. The trees were some 4 to 5 feet in height and the same in diameter, and they were cut in such a manner as to resemble an American Aloe, each stem representing a leaf thereof.

At the base of the low wall that supports the gravel path near to the house is a border of Tea and Hybrid Tea Roses. These are planted in patches of from six to nine plants, and comprise the following varieties: Souvenir de T. Levet, Mme. Haaste, Papa Gontier, Mme. Falcot, Anna Olivier, Viscountess Folkestone, Maman Cochet, Mme. Lambard, and Marie Van Houtte. Seedling Aquilegias of a choice strain raised their flower spikes at intervals amongst the Roses, and the borders of the Rose beds were edged with blue and white Violas.

On the further side of the path that bounds this panel garden commences the extensive lawn, which is the leading feature of Dalton. This had often been described to me by gardening friends, but I was not prepared to find it so remarkable. It is about eight acres in area, and of oval shape, with one apex nearest the house cut off. At the further end there is a long avenue, terminated with an ornamental tea-room, the architecture of which is in keeping with that of the residence. The turf of this lawn is very good, and it is interspersed with patches of heather, which, although trimmed regularly, develops small flower spikes at the base of the growths. On either side of the sward there are double avenues of healthy Beech trees, with towering heads, fully 90 feet in height. The bottom branches develop six or eight feet from the ground line, thus showing the massive trunks of the trees, and affording a view some distance into the woodland behind them. The avenue first mentioned is bordered by Rhododendrons in variety, but especially with *R. ponticum*.

The walks that lead to the upper portion of the grounds extend through the large Beech avenues, hence the grass area of the lawn is not intersected by walks. The Beeches on the northern side are continued up to the mansion so as to give shelter to the terrace garden. Large portions of the outside walls of the mansion, which is built mainly of light-coloured bricks with stone dressings, are covered with *Ampelopsis Veitchii*. I was informed that in autumn the foliage assumes beautiful tints which it does not always develop in northern districts. At the southern end of the

house there is a moderately large conservatory which has an entrance into a corridor connected with the main reception rooms. At the end of the house, near to the conservatory, there is a very fine specimen of the old Rose Fellemburgh. The plant covers a space fully 16 feet in height and as much in width. It was covered with flowers. From the conservatory in a south-westerly direction a path leads to the kitchen-garden and glasshouses. It extends through a part of the pleasure-grounds that is furnished with groups of choice flowering and foliage shrubs, with single specimens at intervals. The last portion of this path is between two borders of choice H.P. Roses backed with Yew hedges in which at every 4 yards are recesses, each containing a fine specimen of the golden Irish Yew.

The area enclosed for kitchen gardens, orchards and the reserve garden is about eight acres. In the centre are four acres enclosed by high brick walls. On the side nearest the mansion is an enclosed portion surrounded with a Yew hedge and fronted by Rose and herbaceous borders. The plants in this quarter are grown for supplying cut flowers. A grass-covered path gives access to the borders. The walls that enclose the kitchen garden are well clothed with healthy fruit trees most of which are in a good fruiting condition. Pear trees in particular were very clean and fairly well fruited. Dalton has long been noted for the fine Pears produced in its gardens. Hundreds of these fruits are now enclosed in small bags made of some light material. Apples, Plums, Cherries and Peaches were all satisfactory, while small fruits were abundant. I was somewhat surprised to find Peach trees succeeding so well trained to wires. My own experience has been against this practice in the north. The wires were fixed 6 inches apart and not more than from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch from the wall.

A list of the leading varieties of fruits grown includes:—Apples—Keswick Codlin, Lord Suffield, Pott's Seedling, Cox's Orange Pippin, Normanton Wonder, Mr. Gladstone, Peasgood's Nonsuch, Newton Wonder, Allington Pippin, Lord Burghley (very good), and Charles Ross. Plums—Early Rivers, Victoria, Pond's Seedling, Coe's Golden Drop and Kirke's. Cherries—Elton, May Duke, Governor Wood, Noble and Morello. Pears—Williams' Bon Chrétien, Clapp's Favourite, Louise Bonne of Jersey, Marie Louise, Doyenné du Comice, Beurré Diel, Conference, Pitmaston Duchess, British Queen, Furondeau, Easter Beurré and Winter Nelis. The best Pears are obtained from triple cordons grafted on the Quince stock. Strawberries—Keen's Seedling, Leader and Royal Sovereign. Peaches—Waterloo, Amsden, June (almost ripe on July 22), Early Silver, Grosse Mignonne and Walburton Admirable. Nectarines—Early Rivers and Lord Napier. All of these fruit trees had good crops of fine healthy fruit.

The kitchen garden was well cropped with the leading kinds of vegetables. Well arranged borders of hardy herbaceous plants skirt each side of the central path. Both borders are edged with a broad line of *Campanula carpatica* alba, at full flower at the time of my visit. In the alleys at the back of each border, are wire arches that are covered with some of the choicer varieties of rambler Roses, and other climbing plants with a single line of

strong-growing herbaceous plants and Sweet Peas, the whole making a pleasing contrast to the vegetable quarters behind them. A great variety of plants form the edgings to the walks both in the kitchen garden and the portions of the grounds attached thereto. Fully three-quarters of a mile of these walks is

in area, the demand being mainly for table plants and for those that are suitable for room-decoration in the winter months. One house contained Carnations, mostly *Souvenir de la Malmaison* varieties, including *Princess of Wales*, *Cecilia*, *Prime Minister*, *Old Blush*, *Sir C. Freemantle*, *Miss A. Campbell*, *Calipso*,

The head gardener's dwelling forms an important feature in the grounds, and there has recently been erected a very commodious residence for the young gardeners.

Mr. Allsop informed me he owes much of his cultural success to a knowledge of chemistry which he acquired years ago. It

FIG. 55.—DALTON HOLME, BEVERLEY; THE RESIDENCE OF LORD HOTHAM.

bordered by *Gentiana præcox*. It was easy to see from the old flower spikes what a beautiful sight this bordering must have presented when in flower. *Saxifraga umbrosa* (*London Pride*) is another plant used on a large scale for this purpose at Dalton Holme. Box was very little in evidence. The glasshouses are not so numerous as in some other large gardens, but they are well adapted to the purposes for which they are intended. They were erected in the early 'seventies by Messrs. Messenger, of Loughborough, and are still in good condition. One of the original boilers of the hot-water system was only removed last winter, being replaced by a large "Quorn" boiler, which Mr. Allsop, the gardener, informed me, answers well. The main range of plant houses is backed by the south wall of the kitchen garden and consists of a large span-roofed greenhouse in the centre, and on either side of this are two hip-roofed vineries, each 40 feet in length and 18 feet in width.

In the early vinery Buckland Sweetwater comes to greater perfection than I have witnessed it elsewhere. The late vinery is planted with the varieties *Lady Downe's*, *Black Alicante*, *Gros Colmar* and *Mrs. Pearson*. The vines are trained on the short spur system, though the plants are not confined to one rod; some have two and three rods each.

I have seen fruit exhibited from these vines at the northern shows during a period of nearly 30 years, and the exhibits have been very successful. The crops generally this season are good.

The glass devoted to plant culture is limited

Floriol, *Horace Hutchinson*, and *Galatea*. As an edging were used small plants of *Centaurea candidissima*, *Primula obconica*, *Lobelia Catherine Mallard*, with a drooping fringe of *Linaria* and *Asparagus* in variety. Under each stage were four brick enclosures situated

has enabled him to properly mix manure so as to suit the various plants and fruits to which it is applied. The soil at Dalton is a good loam resting on clay with a base of chalk. An excellent supply of water is available all over the estate. *Yorkshire Gardener*.

FIG. 56.—VIEW OF THE GARDENER'S COTTAGE AT DALTON HOLME.

at equal distances apart. In these were growing, in pairs, Ivy-leaved *Pelargoniums* *Ryecroft Surprise* and *Souvenir de Charles Turner*. They formed masses of foliage and flowers right up to the angle of the roof and fully a yard in diameter (see fig. 57).

ORCHID NOTES AND GLEANINGS.

ODONTIODAS.

WHEN these interesting plants are more numerous, and they become better known as a race, there is a possibility of their equalling, and perhaps exceeding in popularity, the much-prized genus of *Odontoglossum*. They have recently evoked much discussion, and a few notes respecting them have already been published, but nothing in the form of a complete list has appeared, hence it may now be opportune to give one. The year 1908 should materially add to the interest taken in the new "red race" of Orchids, for there can be little doubt but that the influence of red upon the progeny of *Odontoglossums* and *Odontiodas* will be even greater than is that of *O. Harryanum*, for it will create a new colour, which will permeate the whole family, and ramify to all the allied genera, when the linking-up operation is effected by the hybridist.

Since the time that *Odontioda Vuylstekeæ* appeared at the Temple Flower Show of May 31, 1904, and created such a furore, almost all raisers of Orchids have taken the matter in hand. Considering the short time that has passed since then, great progress has been made, and seedlings of similar crosses exist in many parts of England and on the Continent.

Mr. Charlesworth had previously raised plants which in due time bloomed, and were named *Odontioda heatonensis*, *O. Bohnhoffiae*, and *O. Bradshawiae*. Mr. Stevens, in the Walton Grange Collection, has also several seedlings of a similar cross as that which produced *O. Vuylstekeæ*; some of these should flower in 1908.

In these days, when size of flower and value of plant are the objects, the first results in the primary hybrids will be in many cases disappointing, for the difficulty of utilising a large-flowered species of *Odontoglossum* as the seed-bearing parent is great, but to those persons who do not especially consider size and value, the results will be equally as acceptable, for they will command a "breeding" value, as

Rolfé's articles in the *Orchid Review* of June, 1907, p. 181, and July, 1907, p. 222. At that time I had plants of three *Odontoglossums* crossed with *C. Noezliana*, hence it was unlikely I should have stated it could not be effected. The note in the July issue was written at my request, but it did not fully solve the question.

The information regarding crosses with *C. Noezliana* as the pollen parent in the "Thwaites Collection" (see *Orchid Review*, August, 1907, p. 227) is most interesting, and corroborates my above made statement regarding the ramifications one may expect. I hope to see many additions to our knowledge of this matter as time progresses, for if it be possible to raise freely

Respecting the failure in this case—and I have examined scores of them—I find that the pollen tube has never penetrated to the ovary, even though the column swells normally, as does the ovary to a less degree. The pollen seems to decay upon the stigma and effect irritation only, and not impregnation.

The records to date will be interesting, hence I tabulate them under different headings. I know of others, but for various reasons do not publish them.

CROSSES RAISED WITH *COCHLIODA NOEZLIANA* AS THE MALE OR POLLEN PARENT.

TREES AND SHRUBS.

ULMUS ALATA, MICH.

(THE WAHOO OR WINGED ELM.)

A. D. W., on p. 103, writes of this tree as occurring on Welsh hillsides at 600 feet elevation. I have not the least doubt that what he saw is simply the corky-barked form of a variety of *U. campestris*, which was known to Loudon and others as *U. suberosa*, and which I believe to be a very inferior tree in all respects to either the true English Elm or the Wych Elm. The young branches of this form often take on the winged character figured by Michaux in *U. alata*, a small tree of the southern United States, which I have never seen in England, and which would be very doubtfully hardy in the warmest parts of this country. Even in its own country it is quite a small tree, being, according to Sargent, rarely 2 feet in diameter. H. J. Elwes, *Colesbourne*.

PROTECTING TREE-STEMS FROM HARES.

A VERY simple and effective means, and one that I have used and advocated for years past, is to bind as much of the stems as can be reached by hares or rabbits, with two or three-fold fish-netting. Put on neatly, this is by no means unsightly, and neither hares, rabbits, nor mice will tackle the bark of trees so protected. Old fish-netting too rotten for further use on fruit walls or plots may be used, and will last for years. There are trees here which were protected in this manner eight years ago, and the protection appears as good as ever. I write from a place in which hares are extremely numerous, and, though they have a free run of the orchard, I have never found a protected tree attacked, though any newly-planted tree which may be left unprotected is sure to be ruined in a night. J. C. Tallack, *Shipley Hall Gardens, Derby*.

FIG. 57.—INTERIOR OF CARNATION HOUSE AT DALTON HOLME, WITH IVY-LEAVED PELARGONIUMS OVER THE PATH. (See p. 142.)

being far more likely to cross freely upon *Odontoglossums* than *Cochlioda* itself.

Although the reason is not definitely known, it is generally considered that the pollen tubes of a *Cochlioda* have not the capacity of freely penetrating the longer column of an *Odontoglossum*, though this is not an absolute rule, for I have raised plants of *O. Hallii* ♀, × *C. Noezliana* ♂, and *O. Hallii* has one of the longest columns in the genus.

This brings me to the subject of *C. Noezliana* as a pollen parent, and about which I wish to clear up some misapprehensions in Mr.

upon *Odontoglossums*, time will be gained by getting increased size in the primary hybrids, this being proved by the comparison of *O. Vuylstekeæ* with any of the others raised by using *Cochlioda* as the mother parent.

If the reason of our frequent failure with *Odontoglossum* as the seed parent be as it is supposed, there can be no doubt but that the hybrids will remove much of the disability, and the first seed upon *O. crispum* obtained in this way will produce the nearest approach to a scarlet form of *O. crispum*, which is so anxiously awaited.

CAMPANULA MIRABILIS.

We have already illustrated this remarkable species of Campanula as it flowered in a border against a wall in the Royal Gardens, Kew. (See *Gardeners' Chronicle*, October 7, 1899). Mr. William Barbey Boissier, has, however, sent us such a pretty photograph of the plant in full flower on the rock garden at Valleyres, in Switzerland, we reproduce it with a sketch showing a spray of the flowers about natural size.

Campanula mirabilis was discovered by M. Alboff on September 2, 1894, on the calcareous rocks of Mount Arbika-Akhgösch, in the Caucasus. He found a unique specimen, from which plate I. of the *Prodromus Floræ Colchicæ* was drawn.

"The enclosed photograph" (see Fig. 58), writes M. Boissier, "was taken at Valleyres, Vaud, Switzerland, by Mr. Frederic Barbey, who will be pleased to give seeds to anyone who may address him. The leaves shown at the top of the picture in the left corner also belong to a plant of *C. mirabilis*, which will, no doubt, flower in 1908. The species is monocarpous. For full particulars see *Bulletin de l'Herbier Boissier*, 1895, p. 228."

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 84-90.)

(Continued from page 134.)

5.—SOUTHERN COUNTIES.

BERKSHIRE.—The fruit crops in this neighbourhood are well up to the average, but the trees suffered much from insect pests during the cold and sunless weather late in spring. Strawberries gave promise of an abundant crop, but the earlier flowers were ruined by frost, and later the fruits rotted on the ground before they were ripe. Among small fruits, Raspberries and Black Currants are especially good. *J. Howard, Benham Park Gardens, Newbury.*

—Early in the season the general promise of the fruit crops was good, but when the Apple blossom developed they were seen to lack colour and substance in the flowers. Then followed a prolonged cold and sunless period, and as our chalky soil has a very cold situation, the result was disastrous, and to the Apple crop in particular. Generally these latter fruit trees have a miserable and barren appearance. Apricots and Plums upon wall trees are very good, whilst all small fruits are abundant. *W. Fyfe, Lockinge Gardens, Wantage.*

—The fruit crops in this neighbourhood are generally about an average in quantity. Apricots are above an average quantity, whilst Plums are a very heavy crop. Gooseberries and Currants are also abundant, and Strawberries would have been excellent but for the heavy rains of early summer. These caused the finest fruits to rot on the plants. The soil in this neighbourhood is gravelly, and the wet season has suited all kitchen garden crops. Potatoes in particular promise well. *James Coombes, Englefield Gardens, near Reading.*

DORSETSHIRE.—The following is a copy of a note I made on May 20:—"The weather for the past few days has been very cold; the N.E. wind which has prevailed may prove a little disastrous to the fruit crops, all of which are in need of sun and warmer conditions to encourage the newly-set fruit to grow." My anticipations have, alas! proved correct in respect to Apple, Pear, and Plum trees. I never recollect seeing Apple and Pear trees in particular, so badly infested with aphids, and the former appear wretched. Our trees of Cox's Orange Pippin are now almost leafless, the leaves having turned yellow and dropped off. Plums are an average crop, and, given root waterings, the fruits may finish fairly well. Of Peaches and Nectarines the crop is the best I have known for some years, and Apricots the best crop I ever recollect. The fruit set in clusters evenly over the trees, and have needed much thinning. Of small fruits Gooseberries are a record crop. Red and Black Currants and Raspberries are also abundant, and of excellent quality. Strawberries, which gave some anxiety owing to the berries rotting through the excessive wet, have,

since the weather improved, been excellent. Walnuts are a fair crop, but Cobnuts are very scarce. We have an excellent crop of Morello Cherries, but the fruits of sweet varieties cracked badly. It is a mystery why the Morello Cherry should succeed well in this county and sweet Cherries indifferently. The soil generally is a strong, dark loam on a rocky sub-soil, with clay in places. *T. Turton, Castle Gardens, Sherborne.*

—Apples on the whole are a short crop, although the trees of some varieties are carrying a fair quantity of fruits. The trees flowered remarkably freely, but owing to the wet, cold, sunless weather and frosty nights, the fruits failed to set. These remarks apply also to Pears. Plums are plentiful, especially the varieties Orleans, Victoria, Pond's Seedling, Belgian Purple, and a few others. The nights were frosty when the blossoms were expanded, but the weather was dry, and the flowers of Plums receive more protection from the foliage than those of the Apple. All small fruits are a splendid crop, especially Royal Sovereign and

The season of this fruit has been an extended one owing to the dull weather at the time the berries were ripening. Potatoes promise most unfavourably, and much disease is apparent in the haulm. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

—On the whole the fruit crops are most satisfactory. Apples are a good average yield, and the fruits are clear in the skin, but the trees are somewhat infested with aphids. Apricots and Plums are both satisfactory: the crop of the former is better than any of the past seven years. Small fruits are a full crop, especially Raspberries and Gooseberries; the latter are exceptionally abundant and of fine quality. Strawberries, although somewhat affected by the frost of May 18, when much of the early bloom was destroyed, and, later, by excessive wet, have been plentiful and of good quality. Givon's Late Prolific, grown on a north-east border, will carry the season of this fruit well into August. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer R.S.O.*

FIG. 58.—*CAMPANULA MIRABILIS* FLOWERING ON A ROCKERY IN SWITZERLAND.

Givon's Late Prolific Strawberries. Mulberries, Medlars, Walnuts, Filberts, and some varieties of Damson are plentiful. Our soil is of a light nature, and contains much chalk. *Thomas Denny, Down House Gardens, Blandford.*

—The soil is a light loam, resting on gravel. Plums, Apricots, and some of the older varieties of Apples succeed well in these gardens, but Cox's Orange Pippin does very badly. The crops are backward, and the fruits will be small. Pears on wall trees are very good, and Peaches on an east wall are very fine indeed. *David C. Fyfe, Kingston House Gardens, Dorchester.*

HAMPSHIRE.—Apple trees have never, during the last 30 years, presented such a miserable appearance, and in the case of some trees the leaves are all dead, owing to the unfavourable weather. The fruits, too, are much disfigured. Plums are an extraordinary crop, and the trees are in excellent health. Bush fruits of all kinds are an enormous yield. Strawberries have done well.

KENT.—Although the fruit crops are plentiful, Apples and Pears promise to be small in size on account of the cold nights and sunless weather of early summer. Small fruits are very good. *W. S. F. Sparks, Walmer Place Gardens, Walmer.*

—Apples were in flower during wet, cold weather, and the fruits set badly. Orchard trees on the Crab stock are almost bare of fruits. The trees on the Paradise stock are carrying a fair crop of fruit. Pears require genial weather to mature and swell. Plums and Damsons are enormous crops. Early varieties of Cherries have been much injured by cold winds and frosts, and later ones to a lesser degree, although the latter have improved with the change of weather. Strawberries were retarded by the cold and wet weather, and the berries were neither as large nor as sweet as usual. Black Currants are a grand crop of very fine berries. *George Bunyard, Maidstone.*

— The following remarks apply to orchards (a) on the outcrop of the loam greensand or Kentish rag, and (b) on the Weald clay. The soil of (a) is a strong loam, much mixed with stones; that of (b) is a very tenacious clay, and is fairly level, while (a) rises from it to a height of 270 feet in rather less than a mile. Only orchard trees of Apples, Pears, and Plums are referred to on (b), so that the rest of the report refers only to (a). Taking the scale given below, which I think represents the amount of crop more accurately than the words "under," "over," &c., I should call the Apple crop on (a) 3, and the Plums 5; while on (b) the Apples are 1 and the Plums 3-4. There is not only a difference in soil between (a) and (b), but a considerable difference in climate, the day temperature being higher and the night lower in (b). I have little doubt but that the whole of this slope formed by the outcrop of the lower greensand is the

trees failed to set, and in others the fruits have dropped considerably since they were formed, and they still continue to fall. The fruits are much infected by the maggot. Pear trees in general promise a fairly satisfactory crop; whilst stone fruits are more abundant and of better quality than in any year since 1901. Strawberries were good in general, though the crop in many low-lying situations was severely damaged by late frosts. Our soil and situation is very variable. *Geo. Fennell, Bowden, Hadlow Road, Tonbridge.*

— I have never seen fruit trees of all kinds with more blossom than this season. The majority of our fruit trees are quite young. Apple trees set their fruits well, and the Apples needed thinning, which was done early; at the time of writing the Apple crop is very promising. This remark also applies to Pears. Plums are an exceptionally heavy crop on all trees, and Cherries

— The unseasonable weather has adversely affected the fruit crops in this district. The excessive wet has made spraying for insect and fungus pests of little use. The caterpillar of the Winter Moth has done more harm this season than it has caused for 15 years, solely because spraying in wet weather was ineffectual. The value of shelter from wind for fruit trees has been amply proved this season. The protection given by Poplar and similar shelter trees has done more to save the fruit crops than any other cause. *B. Champion, Baron's Place, Moreworth.*

— Strawberries throughout this district have proved an average crop, but owing to an absence of sunshine, the berries were poor in colour. The variety Royal Sovereign shows signs of "wearing out," but a variety to take its place has not yet appeared. The varieties Sir J. Paxton and James Veitch are still largely grown, and for the making of jam Stirling Castle is still a favourite, being prolific in cropping, of good colour, and of grand flavour. Strawberries were lacking in weight, as the utensils used for their transit did not hold the requisite weight this season without crushing the berries. This is remarkable, after so much moisture and dull weather. Raspberries promise heavy crops, especially the variety Superlative. *W. E. Humphreys, The Gardens, Blenden Hall, Bevelay.*

MIDDLESEX. — Our soil is very light in texture and on gravel subsoil; the present rainy season has therefore been of considerable benefit to small fruits, which are above the average in size. Apple, Pear, and Plum trees all gave exceptional promise, when they were in flower, and I attribute the poor set of fruits to cold winds and frosts, but particularly cold winds, as I find, in more sheltered parts, there are some excellent crops in the neighbourhood. *John Bates, Syon Gardens, Brentford.*

— Generally, the fruit crops are an average in quantity, though they will be late in maturing. The foliage and fruits of some kinds of Apples have greatly suffered through excessive wet and lack of sunshine. This is especially the case with Cox's Orange Pippin. We have a heavy crop of Peaches, and the growths of these trees have lately improved. Late varieties of Strawberries suffered when in blossom, but, on the whole, we have very little to complain of in the case of this fruit. Our soil is somewhat gravelly and porous, and requires a plentiful supply of moisture in hot weather. Caterpillars and aphids were numerous and destructive on Apple and other trees early in the season. *H. Markham, Wrotham Park Gardens, Barnet.*

— Our fruit crops, generally, are satisfactory, but the trees, especially Apples, are blighted and crippled through the cold and unseasonable weather experienced during the latter part of May and June. Most of the soil in this district is a stiff loam resting mainly on clay. In some places the subsoil is gravelly, and on this the top soil is of a light nature. No finer prospect for a plentiful fruit crop could be wished for than the appearance of the trees when they were in blossom, but the cold winds and low night temperatures checked growth. The weather is still unseasonably cold: this morning (July 24) the temperature was down to 45° Fahr. Late Strawberries are not ripening well. *W. Watson, Harefield Place Gardens, Uxbridge.*

— The fruit crops in this district are the best we have had for some years, and the trees are free from blight. Pears are the lightest crop. All small fruits are plentiful. Our soil is a good loam on gravel. *W. Bates, Cross Deep Gardens, Twickenham.*

— Apple trees are much infested with mildew this season, and especially in the case of bush trees of Cox's Orange Pippin. This I attribute to the cold, damp, and sunless weather. Pears are a very thin crop on wall trees, but on the bush, pyramid, espalier, and standard trees the crop is an average one and the fruits are clean. Peaches and Nectarines are always plentiful here. Peach trees planted against a west, and Nectarines against a south wall, in soil with a gravelly subsoil, have not failed to furnish a crop of fruits for the past 15 years. Apricot trees are planted in a low, well-drained situation, resting on a clay subsoil, and trained against a wall facing south-east. They are a great success. Plums are very good this season. Strawberries and other small fruits are planted in gravel and clay soils, earlier varieties on the former and

FIG. 59.—*CAMPANULA MIRABILIS*: FLOWERS PALE BLUE.

(For text see page 144.)

choicest orchard land in Kent, and, probably, in England, and should not be wasted on ordinary agricultural crops. It is worthy of note that at the great fruit show of the Royal Horticultural Society last October, in the "Gardeners' and Amateurs'" Class, both the 1st and the 2nd prizes for 24 dishes of Apples were taken by collections grown on this slope, the 1st at Hunton, the 2nd at East Sutton. The lowest shade temperatures in the blooming season recorded here were 33° in April and 35° in May. The following is the scale upon which my remarks are based: 0 = no crop; 1 = very poor; 2 = rather poor; 3 = average; 4 = good; 5 = heavy. *Alfred O. Walker, Ulcombe Place, near Maidstone.*

— Apple trees were most promising at their flowering period, but the blossom on many

are plentiful all through this district. Apricots are also abundant. With regard to small fruits, Strawberries were a heavy crop, but, owing to the cold, dull, and wet weather, flavour was lacking, although, after a period of hot weather in the middle of July, an improvement was noticed in this respect. Amongst newer varieties Laxton's Latest has made a good impression here, being a robust and healthy grower and heavy cropper; the fruits are firm and of good flavour. Of Black Currants, Boskoop Giant stands out prominently as the best variety. If the later crops fulfil our expectations, 1907 should prove a very satisfactory fruit year. Soil is a heavy, retentive, clayey loam, and when the trees have become established, good crops of fruits are generally produced. *J. G. Weston, Eastwell Park Gardens, Ashford.*

later varieties on the latter, thus giving a good succession of fruits. Lord and Lady Suffield varieties of Strawberries have produced prolific crops: they are in great demand for preserving purposes. A. R. Allan, *Hillingdon Court Gardens, Uxbridge*.

— The fruit crops in this district vary considerably. There was an abundance of blossom on Apple, Pear, and Plum trees, but, owing to the cold winds and frost in May, some varieties of these fruits did not set well. We registered 3 degrees of frost on three consecutive nights, May 18, 19, 20. Apples Ribston Pippin and Allington Pippin are both carrying good crops; but of Lane's Prince Albert there is a very sparse crop. The best-cropped Pear trees are

NOTICES OF BOOKS.

INJURIOUS INSECTS.*

THIS, the fourth report on injurious insects issued from the Birmingham University, is from the pen of Mr. Walter E. Collinge, the Special Lecturer on Economic Zoology. No better testimony of the excellent results obtained from the author's investigations can be given than the numerous testimonials from various fruit growers in the Midlands which are quoted in the pages of the publication. The report is well illustrated, though we fail to see the practical utility of the use of such highly-glazed card for such excellent line drawings as are reproduced on the plates. We can, however, confidently

old paraffin emulsion, with caustic soda added, is claimed to have given excellent results against the attacks of the Apple sucker, mussel scale, and Apple aphid, so much so that the author proposes "to substitute this soda-emulsion spray-fluid in the future for the caustic soda and carbonate of potash spray-fluids given in previous reports."

We have already had occasion to refer to Mr. Collinge's work (see *Gardeners' Chronicle*, August 17, 1907, p. 127) in connection with the treatment of "big bud" in Black Currants, and we may add here, for the guidance of our readers, that "a more lengthy experience has shown that one part of freshly-ground, unslaked lime and two parts of sulphur acts rather better

FIG. 60.—NOTOSPARTIUM CARMICHAELIÆ FLOWERING AT KEW. (See p. 147.)

... by E. J. Wallis.

the varieties Doyenné du Comice, Beurré Clairgeau, Fondante d'Automne, Beurré Superfin, Thompsons, and Durondeau. Of Plums there is a heavy crop of Victorias in this district. Strawberries were a plentiful crop, but owing to frequent rains and an absence of sunshine many of the largest fruits were spoilt. Raspberries, Red and Black Currants have never been finer or more abundant, and the same may be said of Gooseberries. Much sunshine is needed to ripen and harden the vigorous growths made upon nearly all kinds of outdoor fruit trees. The soil here is a light loam overlying gravel. James Hawkes, *Osterley Park, Isleworth*.

(To be continued.)

recommend the report to all those who are interested in the treatment of pests of the garden and field. Altogether 48 pests are dealt with, nearly all of which are only too well known and generally distributed, but such insects as *Sinodendron cylindricum*, *Saperda carcarus*, and *S. populnea* are not likely to prove generally destructive to young, healthy trees.

A little over four pages are devoted to the results obtained from some experiments with insecticides. As a spray-fluid, a modification of the

than equal parts of these." That most destructive of pests the Pear midge "has been almost entirely destroyed" (in some orchards) "by the simple method of turning the surface soil"; dressings of Kainit having proved a waste of time and money, and fruit growers are warned against the application of this material. Vaporite is claimed as a remedy for wireworm; and a good crop of Swedes was grown on infested land dressed with this material. The same agent is recommended as effective for the root-feeding larvæ of the common Swift Moth (*Hepialis lupulinus*), a garden pest which has so often been recorded in the columns of the *Gardeners' Chronicle* as destructive to the roots of

* "Report on the Injurious Insects and Other Animals Observed in the Midland Counties during 1906," by Walter E. Collinge. Fourth report. Pp. 41, pl. 1-VI. Birmingham: Cornish Bros., Ltd., 1907. Price 2s. 6d.

various herbaceous plants, especially the Lily of the Valley. As a preventive against the attacks of the Carnation fly, spraying with a weak solution of carbolic and paraffin is recommended. The exact proportions of the formula are, for some reason, omitted, and without these we would warn horticulturists to be most cautious in applying such materials in a rule-of-thumb way, as being likely to lead to serious injury to plants with such tender foliage. A novel method of trapping millepedes, "with splendid results," is recommended by a Warwickshire correspondent: "Dig out in flower-beds a hole sufficiently large to contain the fist and wrist, and fill with bran . . . and cover with a flower-pot. After two or three days pour on to the bran boiling water. The contents of two such holes were carefully counted—one contained 2,448 dead millepedes and the other 1,793."

The report concludes with a short chapter on instructions for fumigating plant-houses with hydrocyanic acid gas, and stored products with bisulphide of carbon. Finally, under Appendix B, is a useful account of the metamorphoses of insects, intended for those possessing no special knowledge of entomology. We notice one or two errors in the text, thus—Hylesinus should read Hylesinus; Keuhniella (bis) Kuhnella; Budbeckia Rudbeckia. The fly credited with carrying off the larvæ of Tortrix viridana (p. 23) must surely have been a fossorial wasp allied to the genus Crabro and not as stated, by a correspondent, to have been an Ichneumon.

LANDSCAPE GARDENING.*

THAT the third edition of this work has appeared since the book was first published in 1900 shows clearly that there is an increasing demand for books of this nature, especially as it follows closely on others which deal more or less with the subject of garden-making.

The making of beautiful gardens cannot be achieved by following conventional rules and written prescriptions, and those who attempt it learn to appreciate the difficulties of an art which, though apparently simple, is one that requires something more than book knowledge. The planning and planting of artistic gardens is an art which, beyond all others (excepting, perhaps, landscape painting), is subject to conditional circumstances.

Every garden site varies, and must, therefore, be dealt with individually, according to the conditions of locality, soil, and surroundings, in order to produce a successful result.

Consequently, one can understand the difficulties which confront a writer who attempts to reduce to conventional rules the subtleties and intricate details that contribute to the composition of beautiful garden scenes.

The author of this book, however, conveys his knowledge of the "art and craft of garden-making" so far as it can be conveyed in writing and with the aid of plans and pictures.

All the departments of garden-making are dealt with in a more or less comprehensive way, from the choice of sites for a house, to the formation of terraces, lawns, ornamental water, roads and so forth, and chapters are devoted to garden structures for use and ornament, which are important considerations in gardens.

The keynote of the book is the "formal or architectural style," as distinguished from the "landscape style," and, consequently, a great part of the work is devoted to descriptions, illustrations, and plans of formal gardens.

The illustrations of these are of unequal merit: some are admirable, some are not; for instance, those numbered 235, 239, and 233.

Yet the least beautiful garden may be the outcome of the individual fancy of the owner, which no one has a right to criticise, even if illustrated in an instruction book, provided that such a garden is not set forth as an example of beautiful

English landscape gardening, the traditions of which should be jealously upheld.

Turning from these pages on formal gardens to those exemplifying the so-called and much-abused "landscape style," the contrast is marked. For example, the quiet, picturesque beauty seen in the illustrations numbered 174, 116, and others offers a pleasing contrast to the irritating fussiness of the so-called formal gardens with their redundant display of masonry, clipped shrubs, and such-like puerilities.

FIG. 61.—FLOWERING SHOOT OF NOTOSPARTIUM CARMICHAELIÆ: COLOUR OF FLOWERS PURPLISH PINK.

There is, perhaps, a danger at the present day of the intrusion of the architect into the province of the garden-maker, the result being that the gardens he makes remind one of raw canvas set in elaborate picture frames; they are as uninteresting as a garden generally is when laid out by contract, and they lack that cheerfulness which characterises a really beautiful garden.

The successful artist in garden-making is one

who is catholic in his tastes, is in sympathy with all the styles, has the requisite knowledge and ability to apply them, and does not need the assistance of an architect.

These are useful chapters set apart in this book to describing the details of planting, and good and discriminate planting is one of the most essential matters in the foundation of artistic gardens.

These details might have been amplified, and if the lists of selected trees, shrubs, and plants were fuller they would be the more helpful to those to whom the book more particularly appeals. The work is a very handsome volume, and, being written upon a fascinating subject, it is a valuable addition to garden literature.

NOTOSPARTIUM CARMICHAELIÆ.

THIS plant is sometimes described as half-hardy, but the specimen illustrated at fig. 60 is growing in the open at Kew, where it has flowered profusely this season. The genus contains but this one species, and the plant might easily be mistaken for a Genista. It is a native of New Zealand, and is known by the colonists as the "Pink Broom." The plant was discovered on Christmas, 1853, by the late Dr. Munro on the sandy and rocky banks of the Waihopai River, in the Nelson Province. The natural order Leguminosæ is represented by very few members in New Zealand. Notospartium Carmichaeliæ succeeds best in a peaty soil, but it can also be grown well in turfy loam. It is a moderate-sized shrub in cultivation in this country, and produces weeping, cord-like, leafless branches (see fig. 61), from which the short racemes of pink or purplish flowers are freely produced.

THE FERNERY.

DECORATIVE BRITISH FERNS.

FEW persons are aware that the comparatively few species of Ferns indigenous to Great Britain have yielded far more varieties, and these of a far more diverse and pleasing character, than all the rest of the world's Ferns together. Although among the normal forms our own cannot compete with exotic species as regards general beauty and diversity of foliage, when we come to the varietal forms, including those which have been obtained by selection under culture, the position is in a large measure reversed. A number of British Ferns, when fully grown and developed to their utmost capacity, find no rivals at all among exotics and display types of variation, of the occurrence of which in exotic species not a particle of evidence exists. This feature of variation we do not owe at all to cultural selection, since the starting point is always found in the wild plants themselves, which usually possess the faculty of transmitting their peculiarities to their offspring in varied degrees. Fifty odd years ago British Ferns and their varieties were all the rage, and it may well be asked why, if they were so beautiful and so varied, did they go out of fashion and remain practically ignored for so long a period, and why is it that they are now deemed worthy of reinstatement in the popular favour? These queries admit of an easy answer, for, at this early period, the peculiar faculty of sporting had but recently been discovered, and the novelties, though few in number, caught the public taste and led to a demand which new "finds" could not cope with. British Ferns cannot be so rapidly propagated as tender exotics, since they resent heat. The result was that, in order to meet the demand, every plant that was found with some little peculiarity was placed upon the market and purchased for high prices. The seedlings raised from these abnormal forms, instead of being carefully selected on proper lines, were potted up, individually christened, and sold in the same indiscriminate manner, the

* "The Art and Craft of Garden Making," by T. H. Mawson. Third edition. B. T. Batsford, 94, High Holborn, London.

result being that the few fine and symmetrical sports which, at that time, had rewarded the Fern hunter, were absolutely swamped by a swarm of unsymmetrical and defective rogues, which could not possibly retain favour when the craze for novelty was satiated. The inevitable result followed. British Ferns fell from public favour, and only the common or weed forms found places in town gardens as popular representatives of our native Ferns. The British Fern cult, however, survived in the persons of a coterie of enthusiasts, who devoted their leisure to hunting for new varieties, and, having acquired these, to propagating them on selective lines. As time went on the number of these wild Ferns so increased that the process of selection was resorted to. Unsymmetrical or defective varieties would be retained merely as "souvenirs" by the finder, only the choicest being propagated and distributed. Assiduous search brought to light a host of beautiful things far and away surpassing most of the pioneer forms of the "rage" period, and stricter and stricter lines of selection were adopted and adhered to. The result of all this work is that, according to the writer's list in the *Book of British Ferns* (Newnes), some seven hundred choice and distinct varieties are enumerated.

The highly-priced novelty of the early sixties is the rejected rogue of to-day, and to earn the appreciation of the Fern fancier now, symmetry, constancy, and grace must be the qualifications presented in any novelty. Among Fern varieties there are a few, such as the Craigii section of Lady Ferns, which have a tendency to become veritable weeds, their spores being gifted with extra reproductive vigour. The type is erratic in itself, and although it produces a percentage of pretty forms, it also produces a host of mere curiosities. The expert ruthlessly eliminates these, and the nurseryman should do the same, adhering sternly to recognised named varieties. All trade plant exhibitors of these novelties should grow them well and present them at exhibitions in the finest possible condition. In the occasional exhibitions which have been so far made, it has been rare indeed to see a full-grown specimen of a British Fern; the thumb-pot stock plant has been the only "lure," and, naturally, the remark has followed, "British Ferns don't pay." Can this be wondered at? Exotic species are displayed in their full beauty as grand specimens, with foliage piled tier upon tier and in the best possible form. Our native species, given the same chance, could rival the best of them, and, if that chance be given, will hold their own with the best, but not otherwise. *Chas. T. Druery, V.M.H., F.I.S.*

THE PROPAGATOR.

At this season there are many plants which must be increased for next year's flowering, of which the more important are Fuchsias and Zonal Pelargoniums for early stock—the latter in frames or in full sunshine, and the former from half-matured shoots, placed singly in small 60's pots, or to the number of four in larger ones, placing the pots, after affording the sandy soil a good application of water, in a warm house or pit. The cuttings must be shaded from hot sunshine, and the soil and surroundings be kept moderately moist.

Cuttings of the Cape Pelargoniums having scented foliage root readily this month, if half-matured shoots, denuded of the lowermost pair of leaves, be inserted not deeper than 1 inch in sandy soil out-of-doors, or in pots placed in a garden frame facing north, but otherwise exposed to the full light. If the shoots are too soft they will decay instead of forming roots. The foliage of these Cape of Good Hope Pelargoniums is much appreciated in bouquets and when used in filling flower glasses. Every garden should possess a few species, as, for example, *Radula*, *Prince of Orange*, *capitatum*, *graveolens*, *quercifolium*, and *citriodorum*. I must not omit

Fair Helen, Rollisson's Unique, and *erubescens*; this last-named forms a good bedding Pelargonium when two and three-year-old plants are utilised.

Helleborus in variety may now be increased by cutting the thick portions of the roots into pieces 1 to 2 inches in length, and placing these in leaf-soil and sandy loam in pans, which should be stood on a bottom heat of 60° to 70°. The same method may be adopted with *Anemone japonica*, and its single and double-flowered varieties, and *Anemone blanda*.

Clematis Vitalba and other species and varieties are readily propagated from root cuttings during August. When these consist of *C. Vitalba*, they are usually considered to be fit only to serve as stocks on which to graft ennobled varieties, and they are suitable for this purpose when grown to the thickness of a goose-quill. While writing of stocks, it may here be stated that the single red and white-flowered *Camellias* may be struck from half-matured shoots, if placed on a bottom heat of 70°, in a close frame, or in the propagating house. The most expeditious manner is to insert them in a bed of pure sand that is kept moderately moist.

August and September are the most suitable months for striking cuttings of *Callistemon*, *Eucalyptus*, *Eugenia* (*E. australis*, *chinensis*, and *Jambos* may also be rooted in the spring), *Myrtle*, *Melaleuca*, and *Beaufortia*. Of these plants it is advisable to take cuttings from side shoots in the middle of the plants, together with a heel of the older wood. The length of the cuttings should depend on the position of the leaves. The best compost for these cuttings consists of peat one part, and sand two parts. The rooting pans should be well furnished with drainage material in the shape of crocks; a layer of 1½ inch thickness will not be excessive, and over this should be placed a layer of moss. The leaves should be removed for one-third the length of the cutting, which should be inserted to that depth. A bottom heat of 50° Fahr. and much moisture are essential for success. *F. M.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Dendrobiums.—Owing to the lack of sufficient sunshine it has been found next to impossible to maintain such atmospheric temperatures as are generally considered to be necessary for the proper cultivation of those *Dendrobiums* selected for the hottest division; most of these plants are therefore rather late in completing their season's growth. A few of the earliest have reached this stage, and it will be advisable to periodically look over the plants, selecting those which have the terminal leaf at the extremity of the pseudo-bulbs fully expanded, and placing them altogether at one end of the house where more light and air can be admitted, and where their immediate surroundings may easily be kept considerably drier than the other parts in the same house. If a house is devoted entirely to the culture of these plants, no difficulty need be experienced, if the weather is suitable, in securing well-ripened growth, but when a miscellaneous collection of plants is accommodated in the same house, it is difficult to obtain satisfactory results. Those plants which have finished their growths, and are to be grouped together will not require so much water at the root, but they must not be allowed to become very dry, as the roots which commenced to grow early in the season are not only increasing in length, but they are throwing out many lateral rootlets, which should be encouraged to grow. A gradual approach to maturity is always desirable, because the plants will then be the less likely to start into a second growth. After a week or two of such semi-resting treatment in the growing house, the plants may then be removed to a greenhouse where there will be far less shade, and the atmosphere is comparatively cool and dry. They may be placed in a vinery, where it is easy to choose suitable positions, and where the plants will gradually pass from mode-

rate shade into full sunshine, taking care that they are put out of the line of draughts or cold winds. In such houses the pseudo-bulbs quickly become ripened, and when fully exposed to the full glare of the sun, careful judgment should be exercised in watering the plants, affording just sufficient to prevent their roots from decaying, or their pseudo-bulbs from shrivelling. Do not keep the roots in a constantly saturated condition. Therefore, after one thorough watering no more should be applied until the whole compost has become quite dry. Where several plants of any one species or hybrid *Dendrobium* are grown, it seldom happens that all are ready for removal at the same time, and up to the present we have removed the earliest plants of *D. Burfordiense*, *D. Clio*, *D. xanthocentrum*, *D. splendidissimum*, *grandiflorum*, *D. Burberryanum*, *D. rubens*, *grandiflorum*, *D. Juno*, *D. Luna*, *D. Schneiderianum*, *D. melanodiscus*, *D. aureum*, also several *D. nobile* and its varieties. For those plants that are still growing, it is necessary to maintain a warm, moist atmosphere, and to gradually expose them to more light in the mornings, and to remove the shadings a trifle earlier each afternoon. This gradual maturation will prepare the plants to withstand full sunshine almost immediately after the growths are completed.

Seedlings.—All young seedlings that are growing in the warmest house should be placed well up to the roof glass, and be well supplied with moisture until they have finished growth, after which time they may be removed to a light, well-ventilated position, in a temperature similar to that of a Cattleya house, for the winter.

PUBLIC PARKS AND GARDENS.

By W. W. PITTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Employment of qualified gardeners in public parks.—Visitors to public parks sometimes complain that when they ask attendants the names of trees or other plants they get such evasive or curt replies that they are made to feel as if they were asking impertinent questions. The reason is this, that the majority of men employed in our public parks, not being trained gardeners, are unacquainted with the names of many plants, and rather than confess their ignorance to visitors, they either give a wrong name or burke inquiries by assuming a brusqueness of manner. As the public are undoubtedly entitled to receive all possible benefits from their parks, they should, under reasonable circumstances, be in a position to have the names of most of the plants growing in the larger parks supplied to them if they so wish. While park superintendents never desire to encourage the habit of gossiping between members of the staff and visitors, yet it must certainly add to the dignity of a department, and be to the advantage of the general public to have one or two trained men in a park, who, when called upon, can answer such technical questions as are generally asked by visitors. If this is a good policy to pursue in the case of an ordinary park, it is very much more so in the case of a park claiming a botanical character. In such a place every facility should be given to visitors to obtain reliable information, and some trained men should always be employed upon the working staff. It is to be feared that this is not always the case. A few days ago, when visiting a botanical garden, I was greatly surprised and disappointed to find that it was impossible to rely upon any botanical name furnished by the members of the working staff. This was all the more annoying as the majority of the plant labels were in a dilapidated condition. For the sake of economy, incompetent men are very often employed in the places of qualified gardeners. Although it is admittedly difficult to get the right class of men for such places—men who are thoroughly practical and at the same time acquainted with the botanical names of the plants they deal with—they are to be had when the wages offered are reasonable. Park authorities should endeavour to employ some of the very best type of gardeners by offering them good wages.

THE NOTTINGHAM PARKS.—Mr. W. Parker, for some years gardener at Roundhay Park, Leeds, has been appointed superintendent of the public parks and recreation grounds in Nottingham.

PLANTS UNDER GLASS.

By J. G. WILSON, Gardener to H. J. KING, Esq.,
Eastwell Park, Kent.

Fraxinea ramosa.—This is a useful subject for decorative purposes when grown in small pots, but its full beauty is seen when it is given a fairly large receptacle. We have a number of plants in $7\frac{1}{2}$ -inch pots, and these have developed an immense quantity of bloom, averaging about 18 flower-spikes to each pot. They were raised from seed sown in the spring of 1906, and after the plants were established they were placed outside on a bed of ashes, where they remained until the winter, when they were given the protection of a cold frame. The following spring the plants were again placed in the open, where they remained until the flower-spikes began to develop. At this stage they were placed under glass, and stimulated with occasional applications of manure until the flower-spikes attained their maximum development. A few should be grown in smaller pots, as these will be useful for many purposes of decoration.

Solanum capsicastrum.—Red spider and aphides are great enemies of this plant, especially when planted out. A thorough syringing with clear water every evening will, in most cases, keep down red spider, but if this is not effectual, the plants should be sprayed with a suitable insecticide, especially on the under surfaces of the leaves, where the pest invariably makes its first appearance. For combating aphides use tobacco powder while the plants are in the open, but fumigate them directly they are placed under glass. While they are in the beds, cut around the roots with a sharp spade about a fortnight before it is proposed to shift the plants in order to prepare them for lifting and potting.

The propagating house.—*Oplismenus* (*Panicum*) *Burmianii* variegata should now be propagated. Divide the plants and place the portions in small pots, and, if given a brisk heat in a frame, they will soon form numerous roots, and make useful specimens for edging and other purposes. *Selaginellas* of the compact growing type, and *Zebrinas* (*Tradescantias*) are also much in request for edging purposes. These should be propagated at this season.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq.,
Norwood, Alloa, Clackmannanshire.

The Peach and Nectarine.—As soon as the trees of early varieties have been cleared of their fruits, the borders should be well watered, and the foliage syringed vigorously to destroy any insect pests that may be present on the leaves. All gross-growing shoots and any others that are not required, should be removed. The fruits of later varieties have now finished their stoning. Endeavour to promote healthy foliage by frequent syringings of clear water. Maintain a sufficiency of moisture at the roots, and apply manure water once each week. Remove any leaves that shade the fruits, and place pieces of wooden lath between them and the trellis-work, so as to expose them to the full rays of the sun. Trees with fruits colouring should be allowed a plentiful supply of fresh air about them by day and by night. The foliage should not be syringed after the fruit commences to colour. Secure the fruits to the trellis-work or neighbouring shoots with strands of matting crossed at right angles. Furnish a plentiful supply of moisture at the roots as long as the weather continues hot, and maintain a moist atmosphere by damping the paths and the borders daily. This practice will favour the swelling of the fruits. Guard against the borders becoming dry, or red spider will soon make its appearance.

Cucumbers in frames.—The plants are now at their best condition, and will continue to fruit for some time to come. A suitable degree of warmth may be maintained by removing the outside fermenting material around the frame and renewing it with short grass and stable litter. Guard against over-watering, remembering that Cucumbers planted in manure in frames do not require frequent waterings. Pinch the points of the shoots, and harvest the fruits as soon as they are large enough. Damp the foliage lightly, and close the structure early in the afternoon. Seeds should now be sown for a winter supply of Cucumbers. Place the seeds in thumb pots, filled with fresh loam that has received the addition of a little

sharp sand. Place two seeds in each pot within half an inch of the rim, and then fill the pots with the same soil. Plunge them in a gentle bottom heat and water with tepid water. They will soon germinate, and as soon as the seedlings have developed their first rough leaf, place them separately in $2\frac{1}{2}$ -inch pots, using similar compost as before. Keep them plunged in bottom heat until they have become well rooted, when they should be removed to a shelf near the glass, where they may remain until required for planting in their winter quarters.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton,
East Devon.

Plums, like other fruits, are ripening but very slowly. Protect them with netting as soon as each variety commences to change colour. This is an easy matter in the case of wall trees, but large pyramids, bush, or standards in the open are more difficult, so that it will be advisable to gather the most forward fruits every few days and place them under glass for a short time if considered necessary. As each tree is relieved of its crop, do not neglect to thoroughly wash the foliage, using quassia extract if there is any visible insect life. "The Czar" is still one of the best Plums to grow for an early crop, good prices being obtainable for the fruits up to the middle of August.

The affording of water.—The frequent showers of late are apt to deceive beginners, but if an examination is made of the soil an inch or two below the surface, it will be found that the rain has not penetrated much and has been of very little help to trees growing on porous ground and against walls. While it may not be good practice to apply water to the roots of trees now affording ripe fruits, it is decidedly bad practice to allow such trees to suffer from drought, and we frequently aid our trees in this manner immediately the ripest fruits have been gathered, finding that there is no deficiency in flavour in the remaining fruits which ripen a few days after such root waterings have been applied. Clear water is used for the purpose, it being inadvisable to apply manure at such a period.

Strawberry plantations.—Continue to remove all runners as fast as they appear; the showery weather is favourable to the growth of plants recently put out, whether they have been previously forced or are young layers. Keep the soil frequently stirred between the plants. Many gardeners adopt the excellent method of setting out a few rows of young plants for the purpose of supplying runners next season, whether for forcing into pots or for forming plantations. Manure and double dig the ground and set out the plants 6 or 8 inches asunder in rows 12 inches apart. All flower spikes must be rigorously plucked out throughout the season.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow,
Cornwall.

Layering shrubs.—Many hardy and half-hardy shrubs, of such plants as Magnolias, Azaleas, and Rhododendrons, and which are with difficulty increased from cuttings, may be propagated readily by layering. Branches that are near to the ground should be selected for the purpose, and of the ten or more methods of preparing the shoot, those of tongueing, notching, and ringing are the best. Before preparing the shoot, the soil around the plant should be lightly broken up with a fork, and in most cases it is advisable to add some fresh soil. The layering of shrubs by a "tongue" cut is very similar to the layering of Carnations by this method, except that it is on a larger scale. The portion of the stem to be inserted in the soil should be cleared of its leaves, and be cut in a slanting direction towards the point of the branch on its under side. The shoot must be pegged firmly into the soil, care being taken to see that the "tongue" is kept open. Notching and ringing differ only from tongueing in that in the former method a notch is cut out of the under side of the branch, and in the latter method a ring of bark is cut away. The layers should be securely tied to stakes, and the soil in which the shoots are inserted must be kept in a moist condition.

A few varieties of shrubs form roots quickly, but many require to remain attached to the parent for a year, and some for two years.

Hydrangeas and Shrubby Verbenas.—These shrubs will survive the cold of an average winter, but, as a precaution, surplus plants should be provided. Cuttings inserted at this date, and housed in a close pit, root readily. Another plan is to pot small plants a month or so hence, and winter them under cover in case an exceptionally severe winter should injure the outdoor specimens.

Sweet Peas.—Plants raised from seed sown in the open in autumn, form strong, early-flowering stock, and in districts where the winters are mild, this system of cultivating Sweet Peas is worth a trial. The time for sowing will vary in different localities from now onwards until the third week in September. The soil should be made very firm for sowing, and after the seedlings are above ground they should be afforded small sticks, and have the soil drawn up about their stems.

The herbaceous border.—As the early-flowering plants ripen their foliage, they should have the withered and decaying leaves removed, but care must be taken not to injure the new crowns at the base of the stems. The shoots of Dahlias, and most other autumn-flowering plants, are gross and sappy this year, and they need extra care in tying and staking. Seeds of desirable flowers should be gathered as soon as they are ripe, and when the seed-receptacles are perfectly dry. Many biennials which ripen their seeds by the third week in September may be sown as soon as they are gathered; those which ripen later than this period are, as a rule, best sown in the following May.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

Cauliflowers.—In late districts where these can be provided with suitable protection in the winter, such as that afforded by an unheated frame, or a shelf in ainery containing late-fruiting Grapes, or in a Peach house, seeds may be sown now on a warm border. In warmer and earlier districts the sowing may be delayed until the last days of August, making another sowing in September. It is excellent practice to make two sowings, allowing an interval of about a fortnight between them. Prepare the ground by applying a good dressing of slacked lime and well-decayed manure. As soon as the young plants are large enough, they should be pricked out into their winter quarters. After that has been done, it will be necessary to afford air liberally, to keep the plants as sturdy and as hardy as possible. Plants of this description will be better able to stand through the winter, and will not be likely to suffer a severe check when planted out in spring. The variety Early London answers well for these sowings, and should be followed early in the New Year by Magnum Bonum.

Onions.—The crop raised from seeds that were sown last August will now require lifting, and although these will not be stored for any great length of time, they should be allowed to remain on the ground for a few days after lifting, so that the full exposure to sun and air given them may thoroughly ripen and mature them. It is now necessary to twist the tops of the spring-sown Onions, as was previously advised for the autumn-sown crop. This should be done two or three weeks before it is intended to lift the bulbs, and as these are required to keep well through the winter, a little extra time and care bestowed on them will be well repaid. These bulbs should eventually be stored in a light, well-ventilated storehouse, and if care is taken with them in all details, the bulbs will be sure to winter well.

Spinach for consumption in winter.—The ground for this crop should be well prepared, and the seeds sown in drills drawn at distances of 9 inches apart. It is usual to confine this sowing to the winter or prickly variety, but the round or summer type should not be despised, for this will often, to say the least of it, succeed equally well. The prickly type often stands better through the heat of summer than the smooth varieties, and those who have not reversed the usual practice are strongly advised to do so experimentally.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 24—

Co-operative Flower Show at the Crystal Palace.

WEDNESDAY, AUGUST 28—

Derby Agricultural and Horticultural Sh. (2 days).

THURSDAY, AUGUST 29—Sandy (Beds) Fl. Sh.

FRIDAY, AUGUST 30—East Kilbride Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—60°4'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 21 (6 P.M.): Max. 64°; Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 22 (10 A.M.): Bar. 30.3. Temp. 64°; Weather—Fine with occasional sunshine.

PROVINCES.—Wednesday, August 21 (6 P.M.): Max. 60°, Colchester; Min. 56°, Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, THURSDAY & FRIDAY—

Trade Sales of Dutch Bulbs, at 67 & 68, Cheapside, London, E.C., by Protheroe & Morris, at 10.

WEDNESDAY—

Lilium Harrisii, Roman Hyacinths, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 2.

The Bordeaux mixture is perhaps more often recommended for the treatment of plant diseases than any other known remedy. The formula for mixing it has been printed again and again in these pages and elsewhere, yet we frequently receive enquiries from correspondents as to the proper ingredients to use and the proportions in which they should be employed. The following contribution on the chemistry of the subject, obligingly sent us by Mr. Spencer Pickering, cannot fail to be of interest to our readers:—

The statement generally made as to the nature of Bordeaux mixture is that it consists of copper hydroxide; yet a slight knowledge of the properties of this substance would show that such a statement must be incorrect, and that if such were the compound present in the mixture, it would have no fungicidal action, as the hydroxide is insoluble. A sounder explanation is that a basic sulphate of copper is the essential substance present, and that this is gradually decomposed by the carbonic acid of the air, forming copper carbonate and copper sulphate, which latter is the active fungicide. It is only when thus liberated gradually and in minute quantities that copper sulphate will not scorch the foliage, and even when thus liberated, it will still sometimes result in scorching under certain weather conditions. It has also been established that the liberation of the copper sulphate, and, consequently, the fungicidal action, does not begin till some time after the application of the mixture.

This is often a serious disadvantage, and one which must in any case entail loss, for much of the mixture may be washed off before it begins to become effective.

The chemistry of Bordeaux mixture has engaged my attention lately, and it has been ascertained that five different complex substances may be formed when lime acts on copper sulphate, the particular one formed depending on the proportions used. In making Bordeaux mixture according to the ordinary formulæ, where the weight of lime used is from four to six parts to every six parts of crystallised sulphate, the substance formed is a double basic sulphate of copper and calcium, represented by $10 \text{ Cu O}, \text{ SO}_3, 4 \text{ Ca O}, \text{ SO}_3$: where, however, the lime is reduced to the lowest proportions consistent with the precipitation of the whole of the copper, the substance formed is essentially a basic sulphate of copper of the formula $4 \text{ Cu O}, \text{ SO}_3$. In the former case, when the substance is exposed to air, the basic calcium sulphate present in it will be attacked first by the carbonic acid, and till all this has been converted into carbonate, the basic copper sulphate will remain practically intact. This explains the period of incubation noticed before the fungicidal action commences. If, however, the copper salt present is $4 \text{ Cu O}, \text{ SO}_3$, there will be no such delay, for it contains no basic calcium sulphate. This will be a great gain, but there will be a greater one still; for the second compound will, for equal weights of copper taken, liberate two-and-a-half times as much copper sulphate as will the first compound; in other words, we can make with it a Bordeaux mixture as effective as that ordinarily used, at only two-fifths of the cost. This is an important consideration when dealing with an expensive material such as copper sulphate.

The object to be aimed at, therefore, is to use as little lime as possible to precipitate all the copper; and, to do this, it is necessary to use something more definite in composition than the milk of lime ordinarily used. A clear solution of lime, i.e., lime-water, will supply this want, and, fortunately, lime dissolves in water to just the right extent to make a Bordeaux mixture of the usual strength. For what is known in America as the "normal," or "1.6" mixture, 16 lbs. of copper sulphate are taken to make 100 gallons of the wash: for 100 gallons of a wash of the same effective strength it will be necessary to take only 6 lbs. 5 oz. of the sulphate when made in the following manner:—

Take this weight of copper sulphate and dissolve it in 2 or 3 gallons of water, which is best done by suspending it in a piece of sacking in water contained in a wooden tub; zinc or iron vessels must not be used. Take 2 or 3 lbs. of fresh lime, slake it with a little water, and put it into a tub with about 120 gallons of soft water; stir this occasionally, and then leave it to settle. If left overnight, the tub should be covered. It is only the clear liquid which should be used; of this, 86 gallons are drawn off and mixed with the copper sulphate. If exactly the "normal" strength is required, the whole may be made up to 100 gallons by adding 11 to 12 gallons of soft water; if a less strength is required, more water may be added; and, if a greater, then some of the clear liquid may be run off

from the mixture after it has been left to settle. The proportions above mentioned represent 107 pints of lime-water to each pound of copper sulphate, or 134 oz. to each ounce.

However the Bordeaux mixture may be made, the testing of the liquid to make sure that all the copper has been precipitated should never be omitted. This testing is especially necessary in the present case. It is done best by putting into a white saucer some water with a little solution of potassium ferrocyanide added, and dropping into this a few drops of the clear liquid obtained on allowing the Bordeaux mixture to settle. If any brown colour appears, copper is still present, and more lime must be added till the liquid, on testing, shows no change of colour whatever. The strength of lime-water, even when perfectly made, varies somewhat with the temperature, so the amount required for a given weight of copper sulphate will not always be quite the same. But any extra amount which is required should be added very cautiously, for any excess above the minimum amount means so much loss of efficiency and waste of money. The idea that an excess of lime will prevent the tendency to scorch is a mere fallacy. The scorching and the fungicidal action are both due to the copper sulphate liberated; if we do away with the one, we do away with the other also. Excess of lime, unless very great, will not prevent the eventual liberation of copper sulphate; it will only retard it, and cause unnecessary loss.

Doing away with the presence of excess of solid lime, by using lime-water instead of milk of lime, presents several further advantages. Milk of lime will always contain gross particles which wear and clog the nozzles of the machines, and which are easily knocked off the leaves, carrying much of the copper salt with them, and thus entailing loss. Their presence, also, renders the precipitate more compact, and necessitates more agitation of the liquid during use. The basic sulphate made, as here recommended, by lime-water, is in an extremely fine state of division; the particles of it are so small that they can hardly be resolved under the highest power of the best microscope. An even finer compound can be obtained, and one which is much more bulky and settles much more slowly, by using 92 gallons of lime-water, instead of the 86 gallons above recommended; but this compound would have only four-fifths of the efficiency of the other.

The improvement and cheapening of the Bordeaux mixture here suggested has been the outcome of a purely scientific and laboratory investigation of a chemical character; but no doubts need be entertained as to its practical application, for a mixture made in exactly the same way (with lime-water), and of the same strength, was recommended by Prof. Cavazza in 1886, and has been in general use in Italy, with excellent results, ever since.

OUR SUPPLEMENTARY ILLUSTRATION has been prepared from specimens kindly sent us by M. DENIS, Balaruc les Bains, Hérault, France, who, believing his plant to be distinct from *C. sulphureus*, considered it a variety of some other named species, or a hybrid. Our correspondent has it under the name *C. "Klondyke,"* and describes it as having been introduced

VIEW IN THE FERNERY AT SHIPLEY HALL, DERBY, THE RESIDENCE OF
E. MILLER MUNDY, ESQ.

Temple Press Ltd., Printers, 7-15, Rosebery Avenue, London, E.C.

about eight years ago, its exact origin being unknown to M. DENIS, who goes on to say that "the plant is rare in cultivation, doubtless because of the difficulty of obtaining good seed. It is easy to surmount this obstacle by sowing seeds earlier than the other varieties of *Cosmos* are usually sown. By sowing seeds under glass on February 15, seedlings were raised which were put into the open ground in April. These soon flowered, and yielded an abundance of good seed. The plants reached nearly 18 inches in height, and mostly died during the summer. Those which survived formed exuberant growth by autumn, being nearly 4 feet in height. Not the second bloom was not until October, and early frosts killed the plants before they had yielded a second crop of seed." After examining the specimens at Kew in comparison with specimens already in the Herbarium, they were found to answer exactly to *C. sulphureus*, of which species Mr. S. A. SKAN kindly sends us the following note:—"Though by no means a novelty, this plant does not appear to be often seen in gardens, possibly because of its late flowering season, and therefore its liability to be killed prematurely by autumn frosts. Its reputation may have also suffered through the substitution for it of an inferior plant, *Bidens ferulæfolia*, which has been distributed by some seedsmen under the name of *Cosmos sulphureus*. The latter species is a much finer plant, and may be easily distinguished from the *Bidens* by its long-beaked fruits. The *Cosmos* has its headquarters in Mexico, and it is found also in New Orleans. Cavanilles (*Icones*, vol. i., p. 56, t. 79) first described and figured this species about the year 1791, from a plant found growing in the Royal Garden at Madrid. About the same time, Jacquin (*Collect. Suppl.*, p. 155, and *Icones Plant. Rar.*, t. 595) described and figured it under the name of *Coreopsis artemisiæfolia*, the plant, presumably, being then in cultivation in Austria. It is a much branched, more or less pubescent, annual, 4 to 8 feet high; leaves bipinnate or tri-pinnate, 12 inches long or sometimes more; pinnæ alternate or opposite, two or three-toothed, or entire, acute or acuminate; peduncles $3\frac{1}{2}$ to 10 inches long, naked; flower-heads 2 to 3 inches across, from a sulphur-yellow to a deep orange colour; ray-florets usually 8, obovate, often three-toothed at the apex; achenes linear, $\frac{3}{4}$ to 1 inch long, including the long, slender beak. Dr. J. N. ROSE, in *Garden and Forest*, 1895, p. 484, states that the plant has been in cultivation in the greenhouses of the United States Department of Agriculture, Washington, and in his own garden, since 1892, and though very attractive when in bloom, it is too tender there to withstand the autumn frosts. He recommends that the plants be forwarded as much as possible early in the season by starting the seeds in a cold frame or greenhouse, and, further, that plants be placed under glass in the autumn, when they will soon begin to flower, and will continue in the flowering state for a long time. In a wild state the plant grows in the rich soil along creek-bottoms."

THE BOTANICAL GARDEN, NEW YORK.—An idea of the enormous growth of New York, the second largest city in the world, with its 4,000,000 of inhabitants, is obtained from the Bronx suburb, which is readily reached by two elevated railways, and lies to the north of the city. This terrain, 20 years ago, was as difficult to reach as Philadelphia, and possessed a population of about 30,000 persons, distributed over an area of 917 square miles. There were but few good houses, and these chiefly summer villas scattered about in a wilderness of luxuriant-growing deciduous trees. The rest were huts inhabited chiefly by criminals. To-day the Bronx is one of the finest parts of New York, and the inhabitants number 400,000. Its

most noteworthy feature is the Bronx Park which nature and art have united in forming into a charming idyll for the lover of nature. It is laid out in the English style, and contains a zoological and a botanical garden, provided with glasshouses; and a museum. A striking peculiarity of the place, due to climatic conditions, and the composition of the soil, which is rich in silicic acid, is the luxuriant foliage of trees, shrubs, and vegetation in general, and the poor floral development. Compared with the maritime climate of western Europe, the American seaboard shows important differences, and at certain seasons is not particularly favourable to vegetation. There is constant change, and the differences between the temperature in winter and summer are great. The foliage remains on the trees for a long time, often till late in November, a feature of the so-called "Indian summer." Vegetation, however, is greatly delayed in the spring, and often it is the first week in May before a green leaf is seen. Hail storms and long continued rains seldom occur. The botanical museum building consists of four stories, the lower one contains the lecture hall, constructed after the European university model; adjoining this are halls for exhibitions especially fitted up for tropical plants. The actual museum is found on the first floor. The interior is reminiscent in its decorations of the Carrara marble of a Grecian temple. Glass cases contain an enormous collection of all classes and genera of the vegetable kingdom, besides Cryptogamic plants, such as Fungi, Algæ, Lichens, &c., and specimens of timbers, wax models of plant diseases, together with photographs of the same. A large herbarium is situated on the second floor, and on the top storey there is found a very comprehensive library, lighted by a gigantic glass dome. Workrooms for botanical research about on the library. The various officials and the director of the botanical garden, Dr. N. L. BRITTON, are provided with offices in the Museum. The glasshouses, constructed by Messrs. LORD & BURNHAM, cost 225,000 dollars. They face to the museum building, and exhibit the latest improvements in glasshouse construction and fittings. They form three sides of a square, one long side being left open, and consist of five domed houses and six span-roofed connecting houses. The area covered amounts to 47,000 square feet, and the glazing is done on the single-pane plan. The heating apparatus consists of a number of "radiators" constructed in every case of 3-inch pipes, placed together to the number of 20, and the heating power is steam obtained from eight boilers having an expansion power of 80 h. p. A great advantage found in this system of heating is that any repairs needed can be carried out by the garden staff of artificers, and a burst steam pipe can be removed and another inserted without much trouble in two hours. The ventilation is self-regulating and is effected by hydraulic pressure, acting by means of a thermostat. This method saves all the labour usually required by other methods. An interesting article, containing the foregoing particulars, was published in *Die Gartenwelt* for July 20, 1907.

COMARELLA MULTIFOLIATA.—In this Rosaceous plant, collected in the San Francisco mountains, and introduced by C. A. PURPUS about four years since under the name of *Ivesia Purpusii*, we have an interesting subject for the rock-garden. The leaves, 5-7 inches long, are very small, and formed of feather-like leaflets arranged in close order, giving the plant the appearance of a Fern. The plant is comparatively widespread in the higher regions of the San Francisco mountains, and usually in dry, sunny positions, a fact which indicates the best place for it on a rockery. The reddish-brown blossoms are inconspicuous, and the value of the plant as an ornament lies in its pretty foliage. The true *Ivesia Purpusii* stands botanically very close to *Comarella*, but differs

essentially from it. *Ivesias* are difficult of cultivation, whereas *Comarella* is readily grown. J. A. Purpus in *Müller's Deutsche Gärtner-Zeitung*.

CELEBRATIONS AT THE BRAISWICK NURSERY, COLCHESTER.—On the 8th inst., the staff at this nursery was entertained by Messrs. F. CANT & Co. at dinner, to celebrate the coming of age of Mr. SIDNEY CANT. During the evening an interesting presentation was made to Mr. SIDNEY CANT on behalf of the employees.

FORESTRY AT CAMBRIDGE.—The importance of Forestry as a branch of knowledge and as a field for research is engaging the attention of the authorities of Cambridge University. A post of Readership in Forestry has been established, and the appointment has been awarded to Dr. AUGUSTINE HENRY, whose contributions to horticulture, and to botanical science are well known to our readers. Since his return from China, Dr. HENRY has devoted much attention to arboriculture, and has visited the United States, Canada, Spain, Algeria, Corsica, and Italy for the purpose of studying tree growth in those countries.

AMERICAN SEED TRADE ASSOCIATION.—At the annual convention of the American Seed Trade Association, held recently in New York, the President, Mr. HENRY W. WOOD, said that the past season was the most prosperous the seedsmen had experienced, and the outlook for the future was a bright one. In speaking of the general work of the association, he recommended agitation on the tariff question for the reduction of duty on such seeds as cannot be raised in the United States. Amongst other matters of general importance to the trade is pure seed legislation, postal packet rates, telegraph and cable code of the association, and the society's efforts in the fight against the free distribution of seeds, the results of which, thus far, have been discouraging. Dr. GALLOWAY, in a subsequent paper on "What the Department of Agriculture is Doing for the Seed Trade," made mention of the breeding of various grasses, forage plants, vegetables, &c., now being done by experts under Government direction. Mr. GALLOWAY's address will be published shortly with illustrations. Dr. W. W. TRACEY, in an address on "The Seed Trade of the Past 25 Years," alluded to the growth and prosperity of the population, which have resulted in a vast increase in the bulk of seed sold. The relative quantity of American-grown seed was constantly increasing, and the imported seed was only purchased when there was a short supply or the price of foreign seed was lower. Much of the imported seed was of poor germinating quality, and instances were given in which 60 per cent. would not grow. Dr. TRACEY made mention of the common practice of making seed-saving a side product of some other industry. The fruit from which a large proportion of the Tomato seed is taken is utilised for canning or for the making of catsup, and quite a proportion of the Sweet Corn, Peas, Beans, &c., come from fields which were primarily planted for the canning industry, but in which the fruit got too old to use for this purpose, and so was allowed to ripen for seed. In the same way Cucumbers, Melons, &c., planted with the intention of selling the fruit, were allowed to ripen. The practice was a dangerous one, and often resulted in seed which, because of being a mixture, is most undesirable. There has been a decided increase in varietal names, and a comparison was made of lists issued 25 years ago with those of the present day. The average of five leading trade lists in 1882 was 551; whilst in 1907 the aggregate was 689 names, 433 being new. In the lists of 196 leading seedsmen, Tomato seed was offered under 248 different varietal names, 118 of which were offered by a single firm. Yet all could be easily classed under fewer than a score of different types.

VIOLA TRIALS IN THE QUEEN'S PARK, GLASGOW.—The second and final inspection of a trial of Violas (see p. 91) conducted in this park took place on the 14th inst. Four Silver Medals were offered by the Scottish Pansy and Viola Association for the best varieties having blue, white, and yellow flowers, and also for the best variety of any other colour than these. First-Class Certificates were awarded to varieties receiving 36 or more points at either of the inspections. In arriving at their decisions the judges were influenced by the value of the variety for bedding purposes. The following varieties were awarded the medals:—Yellow, Red Braes, from Messrs. JAMES GRIEVE & SON, Edinburgh, with 68 points out of a possible 96; Blue, Ithuriel, from Mr. MICHAEL CUTHBERTSON, Rothesay, 52 points; White, E. C. Barlow, 52 points, from Mr. JOHN SMELLIE, Busby. "Any other colour," Kitty Bell, a variety having lavender-coloured flowers, 60 points, from Mr. CUTHBERTSON. Only three plants were awarded First-Class Certificates, viz.: J. H. Watson, a striped flower, from Mr. JOHNSTON, Bearsden; Red Braes and Kitty Bell.

MARKET NOTES.

Tomato Sunrise.—This variety is finding favour with market-growers, and I recently saw fruits packed for market at the Finchley Nurseries. Mr. Frampton, the manager, informed me the crop is all best quality fruits, which are of a uniform size. The prospects of the out-door Tomato crop are poor, even in the Worthing district, but the season promises good returns for those growers who have crops under glass.

Tomatos in unheated houses.—The fruits should be fairly ripe when gathered, as they are slow to colour after picking. Tomatos have been realising 4s. 6d. per 12 lbs. during the past week. Comet succeeds well under the cold-house treatment, and the crop of this variety now being harvested is most promising.

Price of fuel.—The high price of fuel will be a serious item this winter. I have knowledge of a contract for 1,000 tons of anthracite coal at an increased price of 5s. 3d. per ton over that of last year. Contracts for coke cannot be made for any length of time in advance. Assuming the value of anthracite coal to be 24s., and coke 18s. per ton, it is indeed a serious matter for all, but more especially for the smaller growers.

Canon Hall Grape.—The mid-season crops of this Grape, or those that will be harvested by January, are doing well. Shanking is not much in evidence, owing to the wood having been well ripened last autumn. The season so far has been suitable for Canon Hall Muscat, and will be quite satisfactory if the wood ripens well. This fine Grape appears to succeed equally as well on the stiff Middlesex soil as on the lighter soils of the Worthing district.

A disease-resisting Cucumber.—The variety known as "Butcher's Disease-resisting" is rightly named. I have seen plants of this Cucumber free from disease and bearing a prolific crop, while plants in other houses planted and treated in the same manner had to be destroyed owing to the presence of disease. Market-growers will do well to give this variety a trial. *Stephen Castle.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

HYDRANGEA HORTENSIA AT BOUGHTON PARK.—During a recent visit to this establishment I noticed well-cultivated plants of *Hydrangea Hortensia* growing in tubs on the terrace. The plants measured 8 feet in height and 6 feet through, and each was carrying 100 fully-expanded inflorescences; there being others in the bud state. The plants are given the protection of a greenhouse in winter. When growth commences in the spring-time they are afforded a top-dressing consisting of a mixture of good loam, leaf soil, and artificial manure. *A. R. Pearce, The Gabies, Kenilworth.*

THE CROWN PEA.—I was much interested in the illustration of this plant on p. 120. About 50 years ago I received seeds of it under the name of *Pisum coronatum* from, I believe, Mr. W. Hamilton, seedsman, Cheapside, London. There are two varieties of the Mummy or Crown Pea, the one with flowers of the same colour as the field Pea,

and the other white. I have never seen seeds offered for sale in any nurseryman's or seedsman's catalogue. Another interesting Pea, and one of which I am anxious to acquire seeds, is the white variety of *L. tingitanus*; this seems to be very little known. No doubt it exists in some old gardens. *Justus Corderoy.*

QUESTION NIGHT AT DEBATING SOCIETIES.—Committees of gardeners' mutual improvement societies often find a difficulty in providing fresh subjects and lecturers at their meetings. This difficulty has presented itself in Kingston, where lecturers are no more plentiful than elsewhere, and, as an experiment, one evening in the first half of the winter session has been set apart as a "Question night." Members will be invited to write legibly on strips of paper anonymous questions on subjects of gardening interest. These are to be handed to the chairman, who will present each separately to the members and invite a reply. Should no one volunteer to do so the chairman must do his best to provide a reply. It is hoped that in this way many subjects of general interest to members will be elucidated. *A. D.*

Buddleia Colvillei.—This Sikkim species also flowered in these gardens for the first time in June, 1906. Two plants have also flowered with us this season. The one is a bush-trained specimen in a perfectly open position, and one that is much exposed to cold winds. The weather during the past winter and spring has been exceptionally severe around Edinburgh, but all our plants of *Buddleia Colvillei* have proved perfectly hardy, and show no signs of injury by frost. A plant trained against a north-east wall has grown freely, but has not yet flowered. Our bush-plant, however, was only about 4 feet in height when it first flowered. I notice that on certain of the inflorescences the lower flowers only of the panicle have developed. In the *Gardeners' Chronicle*, August 13, 1892, p. 187, is an excellent illustration of this species, but the figure differs from any specimens I have seen in that the flowers are shown arising half-way between the internodes, whereas I have seen them as axillary only. Probably this arises from a very robust growing specimen being illustrated. The flowers that developed here were very much darker in colour than those illustrated in the *Botanical Magazine*, t. 7749. This beautiful species was, I believe, first flowered in Scotland some four or five years since in the gardens of O. H. Mackenzie, Esq., Inverewe House, Ross-shire. *W. Smith, Royal Botanic Garden, Edinburgh.*

CHRYSANTHEMUMS IN THE PRESENT SEASON.—The cold, wet weather of summer has not been altogether favourable to the Chrysanthemum. It is possible that some varieties, which generally produce their best flowers from the second bud, will this year give better results from their first buds, especially in the case of plants that were late in starting into growth. The plants will not be benefited by heavy feeding until they are under cover, owing to the excessive rainfall. Those persons who have light, cool houses at their disposal may find it advantageous to place choice and delicate varieties under glass soon, unless there is a great improvement in the weather during September. *A. J. Long, Wyfold Court Gardens.*

SUMMER PRUNING OF FRUIT TREES.—I enclose three shoots of last year's growth—one of Pear and two of Apple—showing the effect of last summer's pruning as practised in Mr. E. A. Wilson's garden, Rockingham, Edgbaston Park Road, Birmingham. You will observe that the Keswick Codlin Apple and Williams' Bon Chrétien Pear were enabled last autumn to so mature many of the buds that they formed fruit-buds, whilst those that have not fruited will certainly do so next season. The shoot of Cellini Pippin shows what usually takes place on many of the varieties of Apples and Pears that have been summer pruned at the proper time. It has produced a few fruits at the upper end, whilst the buds below have developed into fruit-bearing buds, and with little or no superfluous side growths that many of your correspondents complain of. The current year's growth is poor and weakly owing to a lack of sunshine, and to all appearances these growths will not be ready for summer pruning until later in the season. In the Warwick Castle collection of Apples staged at the Royal Horticultural Society's Apple Congress (1888) many of the best fruits were from the previous year's wood. At Ragley Hall the best samples of Keswick Codlin, Lord Derby, Wor-

cester Pearmain, and Stirling Castle were, with few exceptions, obtained from the previous year's growths that had been summer pruned. The tables on pp. 400-403 in the issue for June 22 should be of much service to all interested in summer pruning. By reading very carefully the various reports, one lesson can be learned, viz., that one's faculties for observation and discrimination should be brought to bear upon this subject, for many persons seem to regard summer pruning as a matter of form. My experience is that all fruit trees require both summer and winter pruning to yield the best results. Trees properly treated from the commencement will not require much pruning at either season. The most suitable time for summer pruning and the mode of performing it is ruled by many circumstances. Every variety of fruit tree has a habit of growth peculiar to itself, and this varies with cultivation, soil, situation, temperature, &c. *A. D. Christie, Rockingham Gardens, Edgbaston Park Road, Birmingham.*

ASTILBE DAVIDII.—This plant has now been in cultivation long enough for its value in the garden to be tested. Personally, I must confess to disappointment in what I had hoped would prove a fine addition to gardens. It grows more luxuriantly each successive year, and has an excellent habit of growth, but the colour of its flowers turns to an inky shade in a very few days after the flowers open. We purchased six plants, one of which never grew. The other five have grown well. Two of them are of a dull red purple. The first one was of a rosy-pink shade, such as the form which was first exhibited, and much about the shade of the old *Spiraea venustum*. Of the remaining two plants, one is pale rose and the other not a good shade of rosy-purple. Probably, had all been like the one I call rosy-pink, this note would not have been written. It seems a pity that the poorly-coloured forms should be distributed. The spikes grow to a height of 5 feet to 5 feet 6 inches here, and the actual length of the flowering spike is at least 3 feet. The side spray, like the central spike, grows very upright, so that the maximum diameter of the flowering portion does not much exceed 5 inches. The flowers are slow to open, and are borne over a period of about five weeks, commencing in August, but the inky tinge acquired by the earlier flowers spoil what otherwise would be a fine splash of colour. Like most plants of its kind, it revels in a good supply of water, and succeeds best in swampy ground or by a pond which is allowed to overflow its banks frequently. *J. C. Tallack, Dobhysire.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 20.—The exhibition on Tuesday last at the Hall in Vincent Square, Westminster, was again very small, and the attendance of visitors meagre. There were fewer entries for Orchids, and the ORCHID COMMITTEE recommended only one Award of Merit and one Botanical Certificate.

The FLORAL COMMITTEE had several meritorious exhibits to inspect, notably a display of Gladioli, and a representative collection of hardy annuals. This Committee granted an Award of Merit to a large-flowered strain of *Streptocarpus* and a Botanical Certificate to a species of *Rubus*.

The FRUIT AND VEGETABLE COMMITTEE conferred Awards of Merit on two varieties of Melons, and a Potato, all of which had been grown under trial at Wisley. Two meritorious collections of fruit trees in pots, notably one of Apricots, formed the principal exhibits brought to the notice of this Committee.

At the afternoon meeting 16 new Fellows were elected, and a lecture on "Terrace-garden Plants," illustrated by lantern slides, by Mr. JAMES HUDSON, of Gunnersbury House Gardens, was read by the Secretary.

Floral Committee.

Present: W. Marshall, Esq. (in the chair); and Messrs. H. B. May, Jas. Walker, T. W. Turner, Chas. E. Pearson, J. H. Barr, G. Reuthe, W. P. Thomson, W. Howe, E. H. Jenkins, Geo. Nicholson, Jas. Hudson, R. Hooper Pearson, and George Gordon.

Messrs. H. B. MAY & SONS, Edmonton, showed a number of varieties of *Campanula*

isophylla as small pot plants, all of which were covered with their pretty bell-shaped flowers in blue and white colours: the varieties included Mayii, alba and superba. The taller *C. pyramidalis* was also exhibited in both the blue and the white varieties. The group included well-grown plants of *Ixoras*, *Vallota purpurea*, greenhouse *Veronicas*, and flowers of *Lapageria*, including the large-flowering Nash Court variety. Several choice Ferns were interspersed amongst the flowering plants. (Silver Flora Medal.)

Mr. A. Bullock, gardener to E. WYTHES, Esq., Copped Hall, Epping, Essex, showed a group of *Ixoras* in variety. The plants exhibited good culture and were very freely flowered. (Silver Banksian Medal.)

Messrs. PAUL & SON, Old Nurseries, Chess-hunt, Herts, staged a collection of Roses of such varieties as Dean Hole, Le Progrès, Hugh Dickson, George Laing Paul, The Dandy and Farbenkonigen. Sprays of the interesting *Rosa sericea pteracantha* with its dark-red spines, and of *Tamarisk hispida æstivalis*, were also seen in this exhibit. (Bronze Flora Medal.)

Mr. GEORGE PRINCE, Longworth, Berkshire, displayed cut blooms of Roses of suitable garden varieties, and a seedling named after Mrs. Longworth, with striped petals, that are similar in marking to those of the old York and Lancaster. (Silver Banksian Medal.)

Messrs. KELWAY & SON, Langport, Somerset, again exhibited a large collection of Gladioli. The varieties were more numerous than in their exhibit at the last meeting, and they occupied the whole of a table at the end of the building opposite the clock. Some of the finer spikes shown were those labelled Lord Milner (reddish-orange with a yellow lip), Lady Peyton (scarlet), Crown Princess of Sweden (salmon), Dovedale (white, with spots of rose colour in the throat), Lady Macdonald (purple), Edward VII., Brooklands, Golden Sword (yellow), and Glory of Huish. (Silver-Gilt Flora Medal.)

Messrs. W. BULL & SONS, King's Road, Chelsea, displayed an interesting collection of economic plants, many of which were of medicinal value. There were about 60 varieties of such plants as the Olive, *Olea fragrans*, *Cinnamomum zeylanicum*, *Kickxia africana* (from which is produced Lagoon rubber), *Saccharum officinarum*, the Sugar Cane, &c. (Silver Banksian Medal.)

Mr. A. LL. GWILLIM, Cambria Nursery, New Eltham, Kent, showed flowers of tuberous-rooting Begonias of both single and double-flowering varieties. We also noticed some of the "crested" type. The shades of yellow, scarlet, pink, &c., were very beautiful, and the exhibit represented a fine strain of these useful bedding plants. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, staged a group of hardy flowering shrubs and tall-growing herbaceous plants. *Artemisia lactiflora* has numerous inflorescences of cream-coloured flowers; *Eucryphia pinnatifolia* is a handsome shrub that bears numerous large white flowers; *Pavia macrostachya* has tall inflorescences; *Sambucus racemosa* develops large umbels of fragrant flowers; *Berberis hakeoides* is an ornamental shrub when in fruit. We also noticed *Buddleia variabilis magnifica*, *Astilbe Davidii*, *Serratula atriplicifolia*, *Senecio Veitchianus*, hardy Heaths, &c. (Silver-Gilt Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, showed an interesting collection of hardy annuals, interspersed with a few showy border flowers. Varieties of *Helichrysum bracteatum* were very pretty, also *Centaurea "Bridesmaid,"* *Salpiglossis* in variety, *Alonsoa mutisi*, *Phlox Drummondii*, *Zinnias*, *Marigolds*, *Calliopsis atrosanguinea*, *Scabiosa grandiflora*, *Viscaria cœrulea*, *Clarkia pulchella*, *Godetia grandiflora*, and many others. (Silver-Gilt Banksian Medal.)

Messrs. ARTHUR CHARLTON & SONS, Summer-vale Nursery, Eridge Road, Tunbridge Wells, Kent, showed a fine collection of seasonable hardy flowers, including choice varieties of *Gail-lardias*, *Phloxes*, *Veronicas*, *Pentstemons*, *Gladioli*, *Verbenas*, *Liliums*, *Statice*, *Coreopsis*, &c. (Silver Banksian Medal.)

Mr. GEO. REUTHE, Keston, Kent, showed interesting Alpine and hardy plants. *Lysimachia Henryi* is a dwarf species, with relatively large, yellow flowers; *Hypericum cuneatum* is another dwarf plant, the flower-buds are red, but the

petals when expanded are yellow. *Samolus rupestris*, *Tamarisk hispida æstivalis*, herbaceous *Phloxes*, and many other pleasing plants were seen in this exhibit.

Messrs. T. S. WARE, LTD., Ware's Nursery, Feltham, Middlesex, exhibited an assortment of hardy flowers. *Pentstemons* were shown in many fine varieties, also herbaceous *Phloxes*, *Tritomas*, *Chrysanthemum maximum*, *Dendromecon rigidum*, &c., and the whole was relieved with light sprays of *Statice*, *Grasses*, and *Bamboos*. (Bronze Flora Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, showed a number of flower-spikes of their rose-coloured Lupin named *Lupinus polyphyllus roseus* and a white pompon-Cactus *Dahlia* labelled The Bride.

Messrs. WM. CUTBUSH & SON, Highgate Nurseries, London, N., displayed a prettily-arranged exhibit of *Chrysanthemum maximum* "The Speaker," a large-flowered variety, with pure white florets.

Messrs. KENWARD & SON, Lewes, showed a number of floral devices.

Mr. A. WRIGHT, 43, Tharp Road, Wellington, Surrey, showed flowers of *Petunia*, each under a name.

Miss DODGE, Loseley Park, Guildford (gr. Mr. R. Staward), exhibited vases of double-flowered Stocks.

LEOPOLD DE ROTHSCHILD, Esq., Gunnerbury House, Acton, W. (gr. Mr. James Hudson), showed a batch of plants of a small-flowered, scented-leaved *Pelargonium* named Countess of Devon, and excellent specimens of *Cyrtanthus hybridus*, to which a First-Class Certificate was awarded in 1885. A Cultural Commendation was awarded for these latter plants.

AWARDS.

AWARD OF MERIT.

Streptocarpus, Burdell's strain.—Several plants of greenhouse *Streptocarpus*, bearing flowers that measured 3 inches across their widest part, were shown by Mr. F. BURDELL, Sunningdale, Berks. The plants were extremely floriferous: as many as 20 expanded inflorescences and more than this number of cut flower-stalks were seen on some of the plants. The colour was a deep shade of lavender-blue, with crimson blotches near the mouth. The Award was granted to the strain.

BOTANICAL CERTIFICATE.

Rubus bamburarianus. This is a newly-introduced species from China. It has a trailing, drooping habit, with long, bramble-like shoots, bearing handsome triparted leaves of a deep, glossy green above, and with a white tomentum beneath. Each leaf-segment is about 5 inches in length, and linear-lanceolate in shape. The fruits are not unlike those of our native Bramble. Shown by Messrs. JAMES VEITCH & SONS, LTD.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, W. Boxall, G. F. Moore, W. Thompson, J. Wilson Potter, H. T. Pitt, A. A. McBean, T. W. Bond, A. Dye, W. P. Bound, W. H. Young, J. Charlesworth, H. G. Alexander, W. H. White, F. J. Thorne, H. A. Tracy, W. Cobb, and W. Bolton.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander), was awarded a Silver-Gilt Lindley Medal for an immense plant of *Lælio-Cattleya elegans* with 30 flower-spikes, bearing together 230 flowers, the largest spike having 13 blooms. The specimen, which was one of the finest Orchids ever staged at an exhibition, was an example of high culture, the flowers being perfect in development and of fine, rich, purple colour.

Major HOLFORD also received a Silver Banksian Medal for a selection of six new hybrid Orchids, viz., *Brasso-Cattleya Madame Jules Hye*, with pretty, bluish-white flowers, having sulphur-coloured discs to the lips; *Cattleya Pittiana superba*; *C. fulvescens magnifica*, with flowers of a pale buff tint, having handsome rose-veined lips; *Lælio-Cattleya Ophir* "Variety delicata," white, with yellow throat, and rose front to the lip; *Cattleya Euphrasia* "Westonbirt variety," a fine form of the plant recorded at a recent meeting as *L.-C. Macanensis*; and *Lælio-Cattleya Arethusa* (*C. Harrisoniana* × *L.-C. Exoniensis*). Sir TREVOR LAWRENCE, Bart., Burford (gr.

Mr. W. H. White), was awarded a Silver Banksian Medal for a pleasing group of the rare, light-scarlet-coloured terrestrial Orchid *Habenaria rhodocheila*, which is of similar habit to *H. militaris*. The group contained about two dozen very healthy and well-flowered plants. Sir TREVOR LAWRENCE also displayed a plant of *Polystachya odorata*, with a 10-branched inflorescence of white flowers, and a grand specimen of *Bulbophyllum longisepalum*. (See Awards.)

Messrs. CHARLESWORTH & CO., Heaton, Bradford, secured a Silver Flora Medal for a fine group, containing some good examples of their fine strain of *Odontoglossum Rolfeæ* and a hybrid between this and *O. Pescatorei*. The hybrid resembled a very large-flowered *O. Pescatorei*, with violet-purple blotches on the sepals. The group also contained other showy hybrids, including one raised from *Lælia purpurata* × *L. grandiflora* (*majalis*). The seedling showed a great improvement on the latter parent, and was a most attractive flower. Among the species were two plants of *Cycnches Egertonianum*, the one representing the numerous-flowered racemose male form, and the other the female, bearing a short twin-flowered spike of large, wax-like blooms. In the centre of the group was a specimen of the rare *Bulbophyllum viscescens* with an umbel of 10 flowers; other species noted were *Zygopetalum Burkei*, *Z. crinitum cœruleum*, *Brassia guttata*, *Angræcum Scottianum*; the very singular fringed-lipped *Chondrorhyncha Chestertonii* and *Scuticaria Steelii*, with long terete leaves and showy flowers at the base. (See Awards.)

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a meritorious group, the back plants of which were fine selections of *Lælio-Cattleya Blechleyensis*, *L.-C. callistoglossa*, *Cattleya Lord Rothschild*, *Odontoglossum Rolfeæ*, and a very effective arrangement of the scarlet *Disa grandiflora*. Among the newer hybrids, *Cattleya Davisii* (*velutina* × *Hardyana*) was pretty, and showed great variation. *Cypripedium Watsonianum*, *C. Mary Beatrice*, and *C. Niobe magnifica* were other good flowers. Of the species noted were *Stanhopea oculata*, *Catasetum macrocarpum*, *Miltonia Roezlii alba*, *Promenaea xanthina*, *Miltonia Regnellii citrina*, and *Galeandra lacustris*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, Kent, staged an excellent group, for which a Silver Flora Medal was awarded. At the back were six plants of the new *Lælio-Cattleya* George Woodhams (*L. purpurata* × *C. Hardyana*), a fine companion to the handsome *L.-C. callistoglossa*, with large, purplish-rose-coloured flowers, having a finely-developed claret-purple lip; several of a fine type of *L.-C. Blechleyensis*, a large specimen of *Maxillaria tenuifolia*, a selection of *Dendrobium Phalaenopsis*, and several good white *Odontoglossum crispums*. With these were several *Cypripediums*, including the new *C. Braceyana* (*superbiens* × *Lord Derby*), which had flowers of the Lord Derby type, but with much broader petals, and a white ground; *C. Maudiae*, *C. Bella*, *C. Dayanum*, *C. Harrisianum albens*, and several hybrids of *C. Charlesworthii*. The group contained also three plants of *Bulbophyllum Dearei*, a good example of the rose-coloured *Eulophia guineensis*, *Masdevallia Davisii*, &c.

Mrs. TEMPLE, Leyswood, Groombridge (gr. Mr. Bristow), was awarded a Silver Flora Medal for a group of well-grown *Disa grandiflora*, the plants bearing together over 100 very fine scarlet blooms. With them was a very handsome specimen of *Epidendrum Brassavola* with nine flower-spikes.

Baron Sir H. SCHRODER, The Dell, Egham (gr. Mr. Ballantine), showed *Cypripedium Del-lense* (*Mastersianum* × *Rothschildianum*), an effective hybrid with the habit of *C. Rothschildianum*. The upper sepal is greenish-white, with purple lines; the petals are greenish, tinged with rose and spotted with chocolate; the lip is long, compressed, and of a pale reddish-brown colour. We also noticed a good form of *Cattleya A. de Laresse*.

Messrs. JAS. VEITCH & SONS, Chelsea, sent *Cypripediums* Jas. H. Veitch (*Curtisii* × *Stonei platytanum*) and C. W. R. Lee.

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, staged a small group, which contained *Cattleya bicolor Grossii*, *C. granulosa*, *C. Dowiana*, *C. Gaskelliana alba*, several *Lælio-Cattleya Ingramii*, *Odontoglossum Pescatorei*,

O. Wallisii purum, O. Schlieperianum, and various Cypripediums.

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr. Mr. W. P. Bound), sent Cattleya Adula var. Colmaniae bicolor × Hardyana Mrs. Jeremiah Colman), a pretty rose-purple flower with intense ruby-purple lip.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed Oncidium macranthum nanum, with a short spike bearing 12 clear-yellow flowers shaded a slight olive green on the sepals; and Odontoglossum Harryanum grande, a large, finely-formed, and very darkly-coloured flower.

AWARDS.

BOTANICAL CERTIFICATES.

Polycynis Charlesworthii, from Messrs. CHARLESWORTH & Co.—A very remarkable species, with the habit and form of inflorescence seen in *Gongora*, and probably nearest to *P. barbata*. The long, arching inflorescence bore about 50 flowers, each of which measured an inch across. The rather broad sepals, of which the upper one is abruptly turned back, are yellowish and closely mottled with pale red-brown. The singular linear petals are long and curiously twisted, in colour yellow, with some slight, reddish spots at the base; lip long and narrow, brownish, studded with whitish hairs.

Bulbophyllum longisepalum, from Sir TREVOR LAWRENCE, Bart., Burford (gr. Mr. W. H. White).—A very remarkable species, originally figured in *Lindenia III.* as *B. grandiflorum*. The long sepals are projected forward, and form a long, beaked-like flower, which is whitish, closely netted with reddish-claret colour. The species is a native of New Guinea.

AWARD OF MERIT.

Miltonia Schroderiana "Heaton variety," from Messrs. CHARLESWORTH & Co.—A splendid form of this attractive species from Central America, and the largest and best in colour yet shown. The yellowish-white sepals and petals were heavily marked with chocolate-purple; the showy lip is of a dark magenta-rose colour at the base, the apical half being pure white.

CULTURAL COMMENDATION.

To Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., for a very fine specimen of *Bulbophyllum longisepalum* with 14 flowers.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (in the chair); and Messrs. A. H. Pearson, Jos. Cheal, Chas. Walker, Alex. Dean, Wm. Pope, Horace J. Wright, George Relf, Owen Thomas, J. Jaques, J. Willard, W. Poupart, W. Wilks, J. Davis, H. Parr, and W. Bates.

Twenty-one varieties of Melons from the trial of these fruits at Wisley Gardens (see p. 136 in the last issue) formed an interesting exhibit. Two of the varieties were granted Awards of Merit. Several seedling Melons from other sources were presented for Awards, but none was considered worthy of this distinction.

Miss DODGE, Loseley Park, Guildford (gr. Mr. R. Staward), in addition to staging several seedling Melons, showed eight varieties of culinary Peas, six of which were selected for trial at Wisley.

Messrs. W. PAUL & SON, Waltham Cross, Herts., exhibited a meritorious group of pot-trees of Peaches, Nectarines, Plums, and Figs. Of Peaches, there were Amstden June, Goshawk, and Noblesse; Nectarines, Pineapple and Rivers' Orange; Plums, Sultan, Grand Duke, Goliath, Autumn Compôte, White Magnum Bonum, and Pond's Seedling. The Fig trees were used as an edging to the group. (Silver-Gilt Hogg Medal.)

Messrs. T. RIVERS & SONS, Sawbridgeworth, Herts., showed a collection of Apricots as pot plants. The trees were finely fruited, and embraced the varieties Large Early, Montgamet, Peach, Hemskerk, Royal, Precoce d'Oullins, and Moor Park. The trees were not more than three years' grafted. (Silver-Gilt Hogg Medal.)

Messrs. S. SPOONER & SONS, Hounslow, showed 29 varieties of Apples, a few dishes of Plums, and fruits of a hybrid Strawberry × Raspberry. The varieties of Apples included Worcester Pearmain, Stirling Castle, Lord Grosvenor, Red Astrachan, Mr. Gladstone, Early Red Margaret, Cardinal (syn. Peter the

Great), Worcester Pearmain, Early Victoria, and Red Quarrenden. (Silver Knightian Medal.)

AWARDS OF MERIT.

Melon Perfection.—A variety of handsome appearance, for which the Award was mainly granted. The exterior is dark green with white netting. From Messrs. SUTTON & SONS, Reading.

Melon Duchess of York.—This was the best-flavoured fruit of the 21 varieties staged on this occasion. It is of medium size; the flesh is white and the exterior yellow, with reticulations. From Messrs. HURST & SON, Houndsditch.

Potato Favourite.—One of the best-cropping varieties under trial at Wisley this season. The Award was bestowed after a test of its edible qualities. From Messrs. DOBBIE & Co., Rothesay.

A variety of Melon being already in commerce under the name Advance, the Melon granted an Award of Merit under that name by the sub-committee at Wisley (see p. 136) is to be known as Charles Ross, and the award will be recorded under this name.

THE LECTURE.

At the afternoon meeting a lecture on "Terrace-garden Plants" was delivered by Mr. James Hudson, V.M.H. The lecturer contrasted terrace-gardening of the present day with that of some 25 to 50 years ago. He regretted the absence of many of the nobler plants which were formerly used for the adorning of terraces. Large, well-grown specimens of plants in distinct species and kinds at once attract attention and afford a distinctive feature to their surroundings. Mr. Hudson referred to the common demand for what are termed "decorative" plants, many of which are of a fugitive nature.

Details of the culture of the various plants for this phase of gardening were given, and especially the requirements of large specimen plants. Allusion was made to the plants that are grown at Gunnersbury House gardens for the furnishing and adornment of terraces. The list included Myrtles, the specimens of which are very large, Aloysia Lippia citriodora, shrubby Veronicas, immense plants of scented-leaved Pelargoniums, Pomegranates in variety, and Agapanthus umbellatus. These and many other plants, including Palms, Bamboos, Phormiums, &c., are all suitable for this purpose of garden-decoration. Tubs were recommended for such species, in preference to pots.

NATIONAL SWEET PEA.

PROCEEDINGS OF THE FLORAL COMMITTEE, 1907.

The Floral Committee members who attended were:—Mr. Walter P. Wright (chairman), Mr. J. M. Bridgford (Watkins & Simpson), Mr. S. B. Dicks (Cooper, Taber & Co.), Mr. G. Herbert (C. W. Breadmore), Mr. A. Ireland (Dobbie & Co.), Mr. J. Jones (H. Eckford), Mr. Thos. Jones (Ruabon), Mr. A. Malcolm (Duns, Berwick), Mr. Thos. Stevenson (Addlestone), and Mr. T. A. Weston (Lyminge, Kent).

CHAS. H. CURTIS,

Hon. Sec. National Sweet Pea Society.

CERTIFICATES AND AWARDS.

At the Royal Horticultural Hall, July 16:—

AWARD OF MERIT.—To Elsie Herbert (C. W. BREADMORE), Evelyn Hemus (MISS HEMUS), Nancy Perkin (H. A. PERKIN), Rosie Adams (T. STEVENSON), Saint George (HURST & SON), Silas Cole (S. COLE), and The Marquis (DOBBIE & Co.).

At the Reading trials, July 18:—

SILVER MEDAL.—To Saint George (HURST & SON), as the best novelty of the year.

FIRST-CLASS CERTIFICATE.—To Saint George (HURST & SON), and Helen Pierce (H. ECKFORD).

AWARD OF MERIT.—To Princess Victoria (DOBBIE & Co.), Nora Unwin (WATKINS & SIMPSON), Lord Nelson (I. HOUSE & SON), and Prince Olaf (DOBBIE & Co.).

TOO-MUCH-ALIKE VARIETIES.

The following varieties have been bracketed as too much alike. "Not more than one of the

bracketed varieties shall be shown on the same stand at any exhibition of the National Sweet Pea Society." Priority is given the first name:—

{ Etta Dyke	{ John Ingman
{ White Spencer	{ George Herbert
{ Queen Alexandra	{ E. J. Castle
{ Scarlet Gem	{ Rosy Morn
{ Her Majesty	{ Rosie Sydenham
{ Splendour	{ Mrs. W. King
{ Lord Rosebery	{ Phyllis Unwin
{ Cyril Breadmore	{ Flora Norton
{ Mrs. Collier	{ Miss Philbrick
{ Mrs. Felton	{ Modesty
{ Dora Cowper	{ Duchess of Sutherland
{ Ceres	{ Sensation
{ Yellow Dorothy Eckford	{ Countess of Aberdeen
{ Captain of the Blues	{ Princess Victoria
{ Bolton's Blue	{ Pink Gem
{ Lady Grisel Hamilton	{ Countess of Spencer
{ Countess of Radnor	{ Paradise
{ New Countess	{ Enchantress
{ Princess May	{ Olive Bolton
{ Duke of Sutherland	{ Codsall Rose
{ Monarch	{ Gorgeous
{ Lottie Eckford	{ Miss B. Whiteley
{ Maid of Honour	{ Mildred Ward
{ Ivy Miller	{ Countess of Lathom
{ Black Knight	{ Coral Gem
{ Stanley	
{ Boreatton	

* Dobbie's Princess Victoria is meant, not the old variety of this name, which is cerise with carmine standards.

CLASSIFICATION.

The committee recommends the following as the best in their colours:—

White	Dorothy Eckford and Nora Unwin.
Crimson and Scarlet	King Edward and Queen Alexandra.
Rose and Carmine	John Ingman.
Yellow and Buff	Mrs. Collier.
Blue	Lord Nelson and Romolo Piazani.
Blush	Mrs. Hardcastle Sykes
Cerise	Coccinea.
Pink	Countess Spencer.
Orange Shades	Helen Lewis & Henry Eckford.
Lavender	Lady Grisel Hamilton and Frank Dolby.
Violet and Purple	Duke of Westminster.
Magenta	George Gordon and Captivation.
Picotee Edged	Dainty.
Fancy	Sybil Eckford.
Mauve	Mrs. Walter Wright.
Maroon and Bronze	Black Knight.
Striped and Flaked (red and rose)	Jessie Cuthbertson.
Striped and Flaked (purple and blue)	Sutton's Marbled Blue
Bicolor	Jeannie Gordon.
Marbled	Helen Pierce.

EXCLUDED VARIETIES.

With a view to establishing a basis for the elimination of old and inferior varieties, the general committee has, on the recommendation of the Floral Committee, decided to exclude the following varieties from the society's trials in future:—

Sensation	Lady Mary Currie
Duchess of Sutherland	Lottie Hutchins
Katherine Tracey	Venus
Lord Kenyon	Mrs. H. K. Barnes
Colonist	Blanche Ferry
Lady Skelmersdale	Grey Friar
Lovely	Princess of Wales
Mrs. Knights Smith	Sadie Burpee
Queen Victoria	Mrs. Sankey
Salopian	Primrose
Mars	Countess of Radnor
Lady Penzance	Duchess of York
Countess of Aberdeen	Emily Eckford
Her Majesty	Waverley
Mrs. Dugdale	Boreatton
Cyril Breadmore	Fashion
Prima Donna	Countess of Powis
Mrs. Gladstone	Oriental
Mrs. Eckford	Gorgeous
Lady M. Ormesby Gore	Gracie Greenwood
Firefly	Marchioness of Cholmondeley
Dorothy Tennant	Stella Morse
Lady Nina Balfour	Mrs. Joseph Chamberlain
Golden Gate	Pink Friar
Admiration	Blanche Burpee
Countess Cadogan	Emily Henderson
Shahzada	Queen of England
Monarch	The Invincible Varieties
Calypso	
Chancellor	

BRITISH GARDENERS' ASSOCIATION.

The Council of the Royal Botanic Society, Regent's Park, have placed their museum at the disposal of the Executive Council on the occasion of the London Dahlia Society's exhibition on September 12. A conference on "Examinations for Gardeners" will take place at 6 p.m. Members of the association will be admitted to the gardens on presentation of their tickets.

SHROPSHIRE HORTICULTURAL.

Exhibition at Shrewsbury, August 21 & 22.

THE thirty-third annual exhibition was held in the Quarry Grounds, Shrewsbury, on Wednesday and Thursday last, and the event was attended with even greater success than ever. The exhibits were more numerous, and there were two more tents for their accommodation than have been provided on previous occasions. The actual area covered by the tents was 61,140 square feet, being 3,000 square feet more than last year.

The greatest interest still appears to be centred in the competitive exhibits of fruit, and it having been anticipated that Lord Hastings and his gardener, Mr. Shingler, would win the fifty-guinea challenge cup for Grapes for the third and last time, the circumstance added to the interest that has always been evinced in the competitions for that prize. There were 11 entries this year in that particular class, and the task of judging so many important exhibits detained the judges much longer than is usual, inasmuch that the work was incomplete at a later hour than we remember at the Shropshire shows. When at length the 1st prize ticket was placed on Lord Hastings' collection there was a general cheer from the people present in the marquee at the time. It was a popular win. Now that the cup has ceased to be the property of the Shropshire Society, the committee will have to revise the schedule in some degree, and it will be interesting to see if some new feature can be added to the displays of this most remarkable provincial society. Its success in the past has been unequalled by similar exhibitions, as the details we have published from time to time regarding the immense crowds that visit Shrewsbury during the fête, and the large sums of money raised each year, have proved over and over again. It is satisfactory to know that the money has been put to laudable purposes, such as the erection of a suitable statue to Charles Darwin in his native town, the improvement and development of the parks in the town, and the assistance of charities.

Reverting to the show, which is still open as we go to press, it may be remarked that the groups of miscellaneous plants were as delightful as ever. Messrs. J. CYPHER & SONS excelled previous efforts and won the 1st prize in each of the two open classes. It was stated that this firm won prizes amounting to £106!

Tuberous-rooted Begonias were conspicuous amongst the flowering plants.

Additional interest attached to the exhibition of vegetables this year on account of the champion prize offered by the society for the best collection of nine dishes of vegetables in the show. The Duke of PORTLAND and his gardener, Mr. James Gibson, won that prize, and also the 1st prize of £10 in the society's new class, also for nine dishes. The one exhibit gained both prizes. The quality of the vegetables from the experienced growers was of the highest, and it was also satisfactory to see that many new exhibitors of vegetables came forward on this occasion.

The president for the year is Colonel H. J. Hope Edwardes, Netley Hall, Shropshire, and the honorary secretaries are Messrs. H. W. Adnitt and W. W. Naunton, who all these years have done so much to bring about the prosperity the society now enjoys.

CHAMPION GRAPE CLASS.

THE FIFTY-GUINEA CUP WON OUTRIGHT.

The champion Grape class at Shrewsbury was established in 1902. It was arranged for 12 bunches of Grapes in four or more distinct varieties, but not more than four bunches of any one variety could be shown by the same exhibitor. The prizes offered were as follow:—1st, a champion silver cup valued at 50 guineas, and a sum of £20; 2nd prize, £16; 3rd prize, £12; 4th prize, £7 10s.; 5th prize, £5; and 6th prize, £4. At the commencement of the competitions there were no definite points fixed for the different varieties, and some of those which are the more easily grown were shown in first-class condition and won prizes as against Muscat varieties presented in slightly inferior condition. This was altered after the first year

or two, and definite maximum points stated for the Muscat varieties, which were as follow:—Muscat of Alexandria, 11 points; all other Muscat varieties (black or white), 10 points; any other variety of Grape, 9 points. Superior cultivation and finish were recommended to the judges as points of the highest importance. Each bunch is judged on its individual merits and points are awarded separately. The collections may be decorated with flowers and foliage plants at the discretion of the exhibitor, but these decorations form the subject of a separate competition, for which prizes are awarded; they are not considered in judging the Grapes. The Champion Cup was to become the absolute property of the exhibitor who should win it three times. The late Lord Hastings won it in 1902 and 1904. His late lordship's gardener won it also in 1905, but in the meantime a new proprietor having succeeded to Melton Constable, this win, instead of becoming the final for the cup, was regarded as the first in a new competition. The present Marquis has not suffered defeat in a subsequent competition, therefore the cup has now become his property. It is the fifth time the 1st prize has been won in this class by Grapes cultivated by Mr. Shingler. Lord Hastings' exhibit was as follows, and the number of points gained by each dish is indicated:—

	Maximum No. of points.	Points awarded.
Alnwick Seedling (1) ...	9	9
Muscat of Alexandria (2) ...	11	10
Madresfield Court (3) ...	10	9½
Madresfield Court (4) ...	10	9
Muscat of Alexandria (5) ...	11	10½
Gros Maroc (6) ...	9	8½
Madresfield Court (7) ...	10	8½
Gros Maroc (8) ...	9	9
Muscat of Alexandria (9) ...	11	10
Muscat of Alexandria (10) ...	11	10½
Muscat of Alexandria (11) ...	10	10
Black Hamburgh (12) ...	10	9
Totals ...	121	113½

It will be seen that in three cases the maximum number of points was awarded the bunch. In all these cases the quality was very high, but the weight not more than medium. Muscats only failed from receiving the maximum by one point in two cases, and half a point in the two other instances, but it may be pointed out that two of the bunches shown were very deficient in colour. Under the circumstances, therefore, the pointing may be considered very high, and in a better Grape season the standard would have to be raised, as there would be better bunches than those now under notice. But they were the best in the show, and constituted a collection of which any gardener might justly be proud. The 2nd prize was won by J. W. FLEMING, Esq., Romsey, Hants (gr. Mr. W. Mitchell), who was awarded 106½ points, as will be seen from the following table:—

	Maximum No. of points.	Points awarded.
Black Hamburgh (1) ...	10	9
Madresfield Court (2) ...	10	8
Muscat of Alexandria (3) ...	11	10
Madresfield Court (4) ...	10	9
Muscat of Alexandria (5) ...	11	9½
Gros Maroc (6) ...	9	9
Gros Maroc (7) ...	9	8
Madresfield Court (8) ...	10	8
Gros Maroc (9) ...	11	8½
Muscat of Alexandria (10) ...	11	10
Madresfield Court (11) ...	10	8
Muscat of Alexandria (12) ...	11	9½
Totals ...	123	106½

The 3rd prize was won by the Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre), who was awarded 106 points. 4th, G. A. GIBBS, Esq., Tyntesfield, Bristol (gr. Mr. T. Wilkinson), with 102½ points. 5th, the Marquis of DOWNSHIRE, Hillsborough Castle (gr. Mr. T. Bradshaw), with 101 points; and 6th, G. FARQUHAR, Esq., Eastnor Castle (gr. Mr. Mullins), with 99½ points.

OTHER GRAPE CLASSES.

Four bunches of black and white varieties.—In this class, arranged for two bunches of a black and two bunches of a white variety, there were six exhibits. The best were shown by Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert). He had large, well-coloured bunches of Madresfield Court, and heavy bunches of Muscat of Alexandria, the outer berries of which had good colour, but the inner ones requiring a little longer period to perfectly mature. 2nd, Lord SAVILLE, Trafford Abbey, Notts. (gr. Mr. J. Doe), who showed the same varieties, but his berries of Madresfield Court were smaller, and the large bunches of Muscat of Alexandria had berries of irregular size. 3rd, the Marquis of NORMANBY, Mulgrave Castle, Whitby (gr. Mr. J. Corbett), with the varieties Muscat Hamburgh and Muscat of Alexandria.

Black Hamburgh.—Eleven competitors showed in this class, and the winner of the 1st prize was J. BRINTON, Esq., Stourport (gr. Mr. W. H. Wilson), who had well-shouldered bunches of satisfactory size, and highly coloured berries. C. F. BOSTON, Esq., Huyton, Liverpool (gr. Mr. T. Bagnall) won the 2nd prize; and the Earl of LONSDALE, Market Weighton (gr. Mr. C. McPherson), the 3rd prize. The best single bunch of the same variety was of moderate size, but most regular in size and colour-development of the berries. It was shown by Lord HASTINGS. There were 16 exhibits in this class.

Black Muscats. In a class for the best two bunches of a variety of Black Muscat, the 1st prize was awarded to two bunches of the variety Madresfield Court, shown by J. W. FLEMING, Esq., Romsey, Hants (gr. Mr. W. Mitchell). These were long, somewhat attenuated bunches of large, well-coloured berries. The same variety from JOHN BRINTON, Esq., was awarded the 2nd prize; and "Lady Hastings," a sport from Muscat Hamburgh, and exhibited by Lord HASTINGS, gained the 3rd prize. There were nine exhibits.

Madresfield Court. Out of nine exhibits in this class, the best was shown by Lord HASTINGS, and it consisted of two bunches remarkable for the finely developed berries. 2nd, Lord SAVILLE; and 3rd, JOHN BRINTON, Esq.

Black Alicante.—The best two bunches of this variety were shown by G. FARQUHAR, Esq., being of considerable weight and excellent colour. 2nd, the Earl of LONDESBOURGH; and 3rd, C. F. BOSTON, Esq.

Any other black Grape.—The best variety in the "any other black" class was adjudged to be Gros Maroc, as shown by Mr. W. E. HYDE, Ledbury. This was a very good exhibit. The variety gaining the 2nd prize was Alnwick Seedling, shown by Lord HARLECH. These were very large bunches, and the berries were coloured to the last degree possible. 3rd, Gros Maroc, shown by G. FARQUHAR, Esq.

White Muscats.—There were 10 pairs in this class, and the variety Muscat of Alexandria very naturally gained the 1st prize. The bunches shown by the Earl of DERBY, Knowsley, Prescott (gr. Mr. E. F. Hazelton), were of only medium weight, but the berries were well developed, and they had extremely clear and perfect skins, the finish being admirable. These were awarded the 1st prize. The same variety shown in the form of much larger bunches, with berries perfectly ripe, but with disfigured skins, from W. MARSH, Esq., Henrietta Park, Bath (gr. Mr. Taylor) obtained the 2nd prize; and the Marquis of NORMANBY, Mulgrave Castle (gr. Mr. J. Corbett), had the 3rd prize. The most successful exhibit in the class for a single bunch of the same variety was shown by Lord HASTINGS, the berries in this case being very good and the bunch of about average exhibition weight. 2nd, J. W. FLEMING, Esq.

Any other white Grape.—The variety Buckland Sweetwater, shown by H. A. ATTENBOROUGH, Esq., Daventry (gr. Mr. A. Child), obtained the 1st prize in the class for any other variety of white Grape. The same variety shown by

Alderman H. DAVIS, Stoke Bishop (gr. Mr. Curtis), and E. P. THOMPSON, Esq., Whitchurch (gr. Mr. W. A. Webster), won the 2nd and 3rd prizes respectively, but those which gained the 1st prize were very superior in the size of the berries.

LOCAL CLASSES.

There were several classes for Grapes in which only those cultivators residing in the county of Salop were permitted to exhibit. In that for the variety Black Hamburgh, the 1st prize was won by the Rev. T. M. BULKELEY-OWEN, West Felton (gr. Mr. Langley), and the 2nd prize by Capt. HEYWOOD LONSDALE, Shavington Hall (gr. Mr. J. Mills). For Madresfield Court, Lord HARLECH won the 1st prize, and Capt. HEYWOOD LONSDALE the 2nd prize. The winner of the 1st prize in the class for any other black Grape was the Rev. T. M. BULKELEY-OWEN, and W. L. LEVETT won the 2nd prize. The best fruit of Muscat of Alexandria was shown by Lord HARLECH, and the 2nd prize was awarded to Lord TREVOR, Brynkinalt, Chirk (gr. Mr. Dawes). In the class for any other variety of white Grape than those mentioned, the 1st prize was awarded to Muscat of Alexandria, from E. P. THOMPSON, Esq., Whitchurch (gr. Mr. W. A. Webster).

Six dishes of hardy fruits.—The 1st prize was won by Capt. HEYWOOD LONSDALE, who included in his exhibit dishes of Apples, Red Currants, White Currants, Raspberries, Cherries, and Gooseberries. 2nd, N. ROBINSON, Esq., Ellesmere (gr. Mr. W. Roberts).

TABLES OF FRUIT DECORATED AS FOR DESSERT.

Each table measured 10 feet by 4 feet 6 inches. The tables were covered with white cloths, and might be decorated with plants in pots, cut flowers (Orchids excluded), and ornamental foliage. No exhibitor might show more than 15 dishes of fruit, and the kinds must be selected from a list published in the schedule. The 1st prize on this occasion was awarded to the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), who may be congratulated on a well-arranged table of very choice fruits. He won 115½ points, which were awarded in the manner shown in the following table:—

	Points awarded.
Apple The Houblon	6
Apple Cox's Orange Pippin	6½
Grape Appley Towers	6½
Grape Madresfield Court	7
Grape Muscat of Alexandria	7½
Grape Canon Hall Muscat	8
Melon Eaton Seedling	7
Melon Hero of Lockinge	7
Nectarine Spencer... ..	6
Nectarine Elruge	4½
Plum Golden Drop	5
Peach Violette Hative	4½
Peach Princess of Wales	7½
Pear Doyenné du Comice	6
Pear Triomphe de Vienne	5½
Beauty of flower and foliage	7
Blending of colour	7
General arrangement for effect... ..	7

115½

G. FARQUHAR, Esq., Ledbury (gr. Mr. G. Mullins), won the 2nd prize, and obtained 107½ points, showing a very commendable collection. 3rd, the Earl of HARRINGTON, Elvaston (gr. Mr. J. H. Goodacre), with 106½ points. The 4th prize fell to J. DRAKES, Esq., Market Rasen (gr. Mr. T. Cooke), who had 95 points, being only one point more than those obtained by the Hon. E. F. WOOD, Temple Newsam (gr. Mr. R. Dawes). Being arranged in a conspicuous position in the marquee, these decorated tables again excited much admiration; but in the interests of the show the committee would do well to consider the possibility of imparting something of novelty even to this class, as the exhibits each season do not offer sufficient variation. It is particularly unfortunate that on this occasion the floral decorations in the various exhibits were so similar. In five of the six cases *Francoa ramosa* was employed, and generally they were associated with *Montbretias*. These flowers are certainly of a suitable character for such a purpose, but there are many pretty and graceful species that are equally adaptable, and it is a pity that exhibitors have so pronounced a tendency to copy each other's methods in detail.

COLLECTIONS OF FRUITS.

Collection of Sixteen Dishes of Fruit in Sixteen varieties, and not fewer than Twelve kinds.—This is the largest class in those for collections of fruit, and on this occasion there were four exhibits. The 1st prize was won by G. FARQUHAR, Esq., Eastnor Castle, Ledbury (gr. Mr. G. Mullins). He had very large bunches of Black Alicante Grapes, good in size and colour of berries; also good Black Hamburgh Grapes and moderate Muscat of Alexandria. Among stone fruits were Peaches Devonian and Bellegarde, Nectarine Spencer, Plum Transparent Gage, Apricot Large Early, and Cherries Bigarreau Napoleon. He had excellent fruits of Gascoyne's Scarlet Seedling Apple; also Peasgood's Nonsuch Apples, Gunton Hero and a seedling Melon, Marguerite Marrilat Pear, Brown Turkey Figs, and Oxonian Strawberries. This exhibit was awarded the 1st prize for its decorations. 2nd, the Earl of HARRINGTON, whose Grapes consisted of Duke of Buccleuch, Muscat of Alexandria (insufficiently well coloured), Muscat Hamburgh, and Black Hamburgh. He had also good Peaches, Nectarines, Apricots, Plums, Pears, Apples, Figs, Strawberries, and Cherries. 3rd, Mr. W. E. HYDE, Ledbury, who also obtained the 3rd prize for the decorations employed. The Hon. E. F. L. WOOD, Temple Newsam (gr. Mr. R. Dawes), who obtained the 4th prize for fruit, was awarded the 2nd prize for decorations.

Collection of Twelve Dishes.—There were, as usual, more exhibits in this class than the preceding one, and the exhibit which won the 1st prize for the Earl of LONDESBOURGH, Market Weighton, Yorks. (gr. Mr. J. McPherson), was composed of very fine fruits. His Black Alicante Grapes were of a first-rate character, being of satisfactory weight, excellent colour, and having the characteristic shoulders of this variety. Gros Guillaume and Muscat of Alexandria were the other varieties of Grape exhibited, and of these Gros Guillaume was shown in the best condition. The other fruits included two Melons, also Souvenir du Congrès Pear, Ribston Pippin Apple, Pineapple and Lord Napier Nectarines, Royal George Peaches, Transparent Gage Plums, and Brown Turkey Figs. This exhibit also obtained the 1st prize offered for decorations employed in this class, and they consisted in this case of *Montbretias* and *Francoa ramosa*. The 2nd prize was won by Lord BIDDULPH, Ledbury (gr. Mr. H. Cotton). He had of Grapes, Black Alicante, Duke of Buccleuch, Gros Maroc, and Muscat of Alexandria; also Nectarine Lord Napier, Peach Bellegarde, Fig Brown Turkey, Plum Transparent Gage, Pear Souvenir du Congrès, Apple Washington, and two Melon fruits. 3rd, the Earl of SANDWICH, Huntingdon (gr. Mr. J. Barson).

The 2nd and 3rd prizes for the decorations employed in this class were awarded to Mrs. F. NEED, Great Malvern (gr. Mr. J. Jones), and J. DRAKES, Esq., Market Rasen (gr. Mr. T. Cooke).

Eight Dishes.—There were four exhibits in this class, and the 1st prize was won by Capt. HEYWOOD LONSDALE, Shavington Hall (gr. Mr. J. Mills). He had Muscat of Alexandria and Madresfield Court Grapes, Bellegarde Peaches, Elruge and Pitmaston Orange Nectarines, Astrachan Apples, Kirke's Plums, Hero of Lockinge and Baron Hamilton Melons. The 2nd prize was won by Mrs. SWANN, Halston Hall, Whittington (gr. Mr. C. Roberts); and the 3rd by the Rev. T. M. BULKELEY-OWEN, Tedsmore Hall (gr. Mr. J. Langley).

SEPARATE KINDS OF FRUITS.

Peaches.—In the class for six Peaches there were as many as 25 exhibits, and the most of these were of excellent quality, making a fine display of well-cultivated fruit. The 1st prize was gained by very large and well-coloured specimens of Royal George, contributed by Lord SAVILLE. The same variety in somewhat smaller fruits, with more densely coloured skins, from the Earl of LATHOM, was awarded the 2nd prize; and the 3rd prize went to Captain T. A. M. DIGKIN, Loppington House, Wem (gr. Mr. G. Gilbert).

Nectarines.—Though there were slightly fewer exhibits in this class, there were some highly developed specimens in the 17 "dishes" staged. The 1st prize was won by the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle), for

unnamed fruits which appeared to be of the variety Spencer. 2nd, J. W. FLEMING, Esq., with highly coloured fruits of Dymond; and 3rd, A. J. THORNHILL, Esq., Diddington Hall, Huntingdon (gr. Mr. Lockie).

Apricots.—There were 13 "dishes" staged in the class for six fruits of any variety of Apricot. Most of the fruits shown were below the average in quality and size, that has ruled at the Salop show. The explanation appears to be that the season is an abundant one as regards the crops of this much-appreciated fruit, and growers neglected to get their neighbours to thin the fruits for them. Doing the work themselves, they have only adopted the most lenient measures, and consequently the fruits are of very small size. Many of the exhibitors will be likely to strive for larger fruits on another occasion. It is most desirable to have an appreciable size in all stone fruits, because in large fruits the proportion of "stone" to the flesh is less than in specimens that are less well developed. A good dish of fruits of "Early Red" was found for the 1st prize, being shown by G. T. BATES, Esq., Allensmore, Hereford (gr. Mr. R. Grindrod). The same variety from Lord BIDDULPH, Ledbury (gr. Mr. H. Cotton), obtained the 2nd prize.

Melons.—This fruit is always exhibited in large numbers at Shrewsbury, and this year they appeared even more plentiful than usual. The best green-fleshed variety was "Best of All," shown by C. F. BOSTON, Esq., Charlwood (gr. Mr. T. Bagnall). The variety Royal Jubilee, shown by Sir D. DUCKWORTH KING, Wearhouse, Exeter (gr. Mr. Barker), won the 2nd prize; and the same variety from G. A. GIBBS, Esq., Tynte's Field, Bristol (gr. Mr. Wilkinson), the 3rd prize. There were 19 exhibits. In the class for scarlet-fleshed varieties, there were 23 exhibits. Sir D. DUCKWORTH KING, Bart., won the 1st prize with an unnamed fruit. 2nd, Lord ALDENHAM, Elstree, Herts. (gr. Mr. E. Beckett), who showed the variety Superlative. 3rd, Mr. S. H. MATTHEWS, Meste Brace, with the variety Superlative. There were 17 exhibits in the class for white-fleshed varieties, and the 1st prize was won by E. A. YOUNG, Esq., Tan-y-Bryn, Bangor (gr. Mr. A. Ruddock). It should be added that the Melon fruits are all tasted by the judges, and the prizes are awarded for superior flavour.

Plums.—The best 12 fruits of a Gage Plum were shown by the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), who had the variety Transparent Gage. The best collection of 12 fruits of a yellow Plum other than a "Gage" variety was from the Earl of LONDESBOURGH, and he had the variety Coe's Golden Drop. In the class for a variety of red or purple Plum, the 1st prize was awarded to the Duke of PORTLAND, Welbeck Abbey, Notts. (gr. Mr. J. Gibson), for fruits of Kirke's.

Cherries were exhibited in a class for single dishes, and the 1st prize was gained by the variety Bigarreau Napoleon, shown by G. T. BATES, Esq., Hereford (gr. Mr. R. Grindrod).

GROUPS OF MISCELLANEOUS PLANTS.

These classes are at Shrewsbury of the highest character, and the competition is invariably keen. Some of the best known experts in grouping enter the competitions. In the class for plants in and out of flower, to occupy a space not exceeding 300 square feet, £60 is offered in three prizes.

On this occasion the 1st prize was awarded to Messrs. JAMES CYPHER & SONS, Cheltenham, whose group was a most harmonious decoration throughout, the combination of colour being in exquisite taste and keeping. The background comprised an elegant specimen of *Kentia Belmoreana*, associated with brilliant trusses of *Ixora Fraseri* and *I. macrothyrsa*, well-developed single-stem specimens of *Crotons Andreanus*, *Evansianus*, and *Thompsoni*, pretty examples of *Humea elegans* and *Francoa ramosa* being arranged towards the centre, hence causing no obstruction. Along the front were such Orchids as *Oncidium varicosum* Rogersii, *O. obryzatum*, *Odontoglossum crispum*, *Cattleya crispum*, and several *Laelio-Cattleya* hybrids, also such fine things as *Dendrobium formosum giganteum* and *D. Phalaenopsis Schröderiana*. These exhibitors have rarely ever staged a finer group, even at such a show as Shrewsbury.

The 2nd prize was awarded to G. H. KENDRICK, Esq., Edgbaston, Birmingham (gr. Mr. J.

V. Macdonald). This group was particularly brilliant with highly-coloured Crotons, of which there were rather too many, but the arrangement was specially good, and reflected the highest credit upon the exhibitor. *Francoa ramosa* and *Fuchsia triphylla* at the back of the group were in good keeping with the Crotons. Towards the front were such Orchids as *Vanda cœrulea* (lovely in its effect), *Cattleya Harrisonii* and *Lælia elegans*, with dwarf examples of *Ixoras* and *Begonia Gloire de Lorraine*.

The third prize went to Mr. W. A. HOLMES, Chesterfield, who had a bright and tastefully-arranged group in excellent taste. Dorothy Perkins Rose here was used rather freely, with a few good Orchids towards the front, several fine examples of single-stem Crotons, such as *C. Reidii* and *C. Warrenii*. This group, though very effective, was slightly overdone with these single-stem plants. Two other excellent exhibits were by Mr. FINCH, of Coventry (who had central arrangement, in itself effective, but rather too massive), and by Mr. VAUSE, of Leamington, which was a group of considerable merit. *Cattleya Harrisonii* was used here very effectively, also *Clerodendron fallax*. The competition in this class was probably never more keen than on this occasion. It afforded an exhibition in itself, and was one of the best possible object-lessons in grouping.

The same amount of money was offered in the class for foliage plants, with the same limit as to space. This class is always a feature at this exhibition, and after some years of experience the exhibitors have arrived at a high class of perfection in their exhibits. It is also an object-lesson to gardeners in general as to the best possible plants to choose for such a purpose in home decorations. The 1st prize in this class went to Messrs. JAMES CYPHER & SONS, whose group was prominent by the very rich colouration of the plants employed, whilst the "finish" was all that could be desired. Three well-balanced Kentias were employed at the back; Crotons were employed most effectively, such as *C. Warrenii*, highly coloured, and the best of the broad-leaved varieties, *C. Thompsonii* being a prominent feature. The groundwork in this group was of excellent taste, no overcrowding, but every plant affording good effect. The dwarf-growing, variegated *Saxifraga* in the front was in good keeping, and *Strobilanthes Dyerianus*, with *Jacaranda mimosifolia* and dwarf *Marantas* were most effective.

Mr. W. A. HOLMES was second in this class, his group being well arranged. The plants employed harmoniously blended, the silvery foliage plants set off the highly-coloured Crotons to good effect. The choice of material here was excellent, and the plants in the best of health, notably the Crotons. The 3rd prize was awarded to the LEAMINGTON NURSERYMEN AND FLORISTS, LTD., of Leamington. This group pressed the second-prize winner very closely indeed; the highly-coloured Crotons in the choicest variety, *Nandina domestica* (a Japanese plant), rarely ever seen employed in this manner, was most striking, the toning down by the employment of light green Ferns and *Eulalia japonica* variegata with *Dracæna Sanderiana* being done in the best possible manner. Mr. G. H. KENDRICK also showed well in this class, being very close up to the 3rd prize, with well-grown and well-coloured plants; the two corner pyramids at the front were, however, too heavy to be of the best effect.

In a smaller group class open to exhibitors in the county of Salop only, this being a mixed class wherein £20 was offered in three prizes, a space of 100 square feet was allotted. Mrs. SWANN, Halston House (gr. Mr. C. Roberts) was an easy 1st, with a miniature arrangement as seen in the larger classes. The Crotons and the *Ixoras* told with good effect, so also did *Dracæna Victoria* and a few good *Alocasias*.

E. BIRD, Esq., Shrewsbury (gr. Mr. H. Kennett) was 2nd. Flowering plants of *Cannas*, of *Tuberoses*, and *Lilium Harrisii* were effectively used, with a few good *Gloxinias*.

SPECIMEN PLANTS.

In the class for 15 stove and greenhouse plants, Messrs. CYPHER & SONS were easily 1st with fine examples of cultivation, embracing grand specimens of *Statice profusa*, 5 and 6 feet through, and of good colour; *Rondeletia speciosa major*, finely flowered and in the best

of health (a plant now rarely seen); two grand examples of *Ixora macrothyrsa* and another of *I. Shawii*; two large plants covered with flowers of *Chironia ixifera*, and a fine plant of *Erica Aitoniana*, with *Allamanda nobilis*, and three fine Palms at the back. Mr. VAUSE, Leamington, was a good 2nd in this class; his best plants were of *Erica Aitoniana*, *E. oblata purpurea*, and *E. exquisita*, all good, fresh specimens; there were two Crotons, well coloured, and three *Allamandas*.

Mr. MANNING, of Dudley, won the 3rd prize, his best plants being a good *Allamanda Hendersonii*, and a few good *Ixoras*, and one of *Rondeletia*, with two healthy *Kentias*.

For six stove and greenhouse plants, Messrs. CYPHER & SONS were again 1st, with a superb set of six plants worthy of the best days of specimen cultivation. These included two large plants of *Statice intermedia*, highly coloured, and of *S. profusa*, with two fine *Ixoras*, *I. macrothyrsa*, with huge trusses, and *I. Fraseri*, a mass of flower, *Erica oblata purpurea*, very fresh, and a grand plant of *Allamanda nobilis*, a mass of flower, made up this half-dozen. Mr. VAUSE was 2nd in this class also, his best plants being of *Erica Austiniana*, a grand specimen, and very fresh; *E. Aitoniana*, a fine plant, and two *Ixoras*, hardly at their best.

For six stove or greenhouse plants (local class), Lord HARLECH, of Brogyntyn, Oswestry (gr. Mr. Lambert), was 1st with good examples of *Eucharis amazonica*, *Clerodendron fallax*, *C. Balfourianum*, and *Ixora macrothyrsa*, with *Allamanda Williamsi*, a very pretty and useful species.

Mr. SWANN was 2nd in this class, staging a fine *Kentia australis*, two good plants of *Ixora Williamsii*, and a good example of *Croton Warrenii*. Mr. JAS. TARRANT, of Shrewsbury, was placed 3rd, having in his exhibit good plants of *Ixora* and *Clerodendron*.

The class for 30 stove and greenhouse plants at Shrewsbury, to be grown in 10-inch pots, has been for years one of the best classes in the show from a cultural point of view. For the first time Messrs. CYPHER & SONS have this year won the 1st prize, a good proof of the excellence of the exhibits. In their exhibit, the *Ixoras* were a particularly strong feature, the best being the fine young specimens of *Ixora macrothyrsa*, of which there were five plants; fine dwarf plants of *Statice intermedia* were also staged; also *Rondeletia speciosa major*, and some good Crotons and Palms.

Mr. VAUSE came in a good 2nd in this class with several highly-coloured *Bougainvilleas*, a few dwarf and sturdy *Ericas*, *Ixoras*, Crotons and *Statice*.

The 3rd prize was awarded to Mr. SWANN, Halston Hall (gr. Mr. C. Roberts), for several capital dwarf *Ixoras*, well flowered; also of *Dracæna Victoria*, and of Crotons, with two or three good Palms. *Dracæna Godseffiana* was shown here in good character.

For 12 stove and greenhouse plants, also in 10-inch pots, Sir A. MUNTZ, Bart., M.P., Dunsmore, Rugby (gr. Mr. H. Blakeway) was 1st with well-grown young plants; these consisted of three good *Ixoras*, two of *Allamandas*, *Pancratium fragrans*, an excellent *Cycas*, and some good Crotons.

For six ornamental fine foliage plants, Messrs. CYPHER were also 1st with three finely-coloured Crotons, notably the old *C. angustifolius*, and of *C. Countess*, with three Palms, of which *Phoenix rupicola* and *Kentia Forsteriana* were the best.

Mr. W. VAUSE was 2nd in this class, *Croton Queen Victoria* being his best specimen.

Begonias.—There were several exhibits in the classes for a group of tuberous-rooted *Begonias* arranged for effect on table spaces of 15 feet by 4 feet. The 1st prize was won by Messrs. BLACKMORE & LANGDON, Twerton Nurseries, Bath; the 2nd by Messrs. T. S. WARE, LTD., and the 3rd by Mr. DAVIS, of Pershore. The quality observed in these collections was beyond praise.

CUT FLOWERS.

Collection of Hardy Perennials, Roses excluded.—Messrs. GUNN & SONS, Olton, were awarded the 1st prize in this class for clean, fresh examples of *Phloxes* *Josephine Gerbaux*, *L'Aiglon*, and *Sylphide*; *Campanula Mariesi*, *Cimicifuga japonica*, *Coreopsis grandiflora*, and *Lilium longiflorum*; 2nd, Messrs. G. GIBSON &

Co., Bedale; 3rd, Mr. M. PRICHARD, Christchurch, Hants.

Dahlias.—In a class for a collection of Cactus or Decorative Dahlias, Mr. J. WALKER, Thame, was an easy 1st, with a pleasing arrangement of Cactus varieties displayed in bamboo stands, vases, and ornamental baskets; 2nd, Messrs. KEYNES, WILLIAMS & Co., Salisbury.

Mr. J. WALKER also took the premier position in the class reserved for miscellaneous Dahlias with a very handsome lot of flowers artistically arranged; 2nd, Mr. W. TRESEDER; 3rd, Messrs. KEYNES, WILLIAMS & Co.

Collection of Phloxes.—Mr. M. PRICHARD was placed 1st with bold clumps of the leading varieties; 2nd, N. G. HARRIES, Esq., Wightwick, Wolverhampton (gr. Mr. J. Pugh); 3rd, Mr. F. BONSKELL, Market Bosworth.

Amongst 12 competitors who staged in a class for an arrangement of cut flowers (Orchids excluded) suitable for a dinner table, to occupy a space 4 feet by 4 feet, Mrs. J. NIXON, Alderley Edge, was placed 1st. The flowers relied upon were *Gloriosa superba* and *Francoa ramosa*; 2nd, Miss J. HIRST, King's Heath, who used flowers of a lovely pink *Carnation*, relieved with *Asparagus* and *Selaginellas*; 3rd, Mrs. H. B. VERNON, Bowden, Cheshire; 4th, Miss POPE, King's Norton.

SWEET PEAS.

Arrangement of Sweet Peas were exhibited on tables (open to ladies only). There were 16 exhibits in this class, and the one from Mrs. E. WINCHESTER, Northfield, pleased the judges best; 2nd, Mrs. W. MARPLE, Penkridge.

Competition was also keen for the prizes offered by Mr. ROBERT SYDENHAM, Birmingham, for Sweet Peas, to be shown in his rural table decorations. 1st, Mrs. W. MARPLE; 2nd, Alderman HOWELL DAVIES, M.P., Bristol (gr. Mr. J. T. Curtis); 3rd, Mrs. G. D. FORD, Acocks Green.

Mr. T. JONES, Ruabon, won the 1st prize in Mr. Sydenham's class for 18 bunches of Sweet Peas; Mr. W. STANSBURY, Hope-under-Dinmore, took the 2nd prize; 3rd, A. HUGHES, Esq., Knowle (gr. Mr. T. Parry).

Of the 15 competitors for the 25 Guineas Silver Challenge Cup and £2, offered as 1st prize by Mr. Henry Eckford, Wem, for 18 varieties of Sweet Peas, Mr. T. JONES, Ruabon, was placed 1st with flowers of a high order of merit; 2nd, P. YORKE, Esq., Wrexham (gr. Mr. G. Aitkens) with a beautifully fresh lot of flowers; 3rd, R. BATHURST, Esq., Chudleigh (gr. Mr. G. Powney).

The Rev. E. BROWN, Bedstone Rectory, Bucknell, won 1st prize for six varieties of Sweet Peas offered by Messrs. Jones & Sons, Shrewsbury; 2nd, A. E. PERKINS, Esq., Sundorne Castle.

The 1st prize for 12 varieties of Sweet Peas offered by Messrs. Baker's, Wolverhampton, was won by Mr. T. JONES, Ruabon, with a wonderfully even lot of flowers of much merit; Mr. T. PROCTOR, Carnforth, was a good 2nd.

CARNATIONS.

Owing to the cool, late season, these flowers were shown in excellent condition. The 1st prize for a collection of Carnations and Picotees, shown with their own foliage and buds, and not dressed, space 6 feet by 4 feet, was awarded to Messrs. BLACKMORE & LANGDON, Bath, who had good flowers of *Volunteer*, *Bridegroom*, and *Delicate*; 2nd, Mr. C. H. HERBERT, for a well-arranged collection containing flowers of good substance and quality; 3rd, Mr. A. R. BROWN, King's Norton.

The best collection of Tree Carnations came from Mr. A. F. DUTTON, Iwer, Bucks, with exquisite flowers of Mrs. T. W. Lawson, Robert Craig, Enchantress, and President, all artistically arranged; 2nd, Mr. S. MORTIMER, Rowledge, Farnham.

In a class for 12 varieties of Carnations or Picotees, three blooms of each, C. ALCOCK, Esq., Blundellsands, Liverpool, was placed 1st, Mr. A. R. BROWN, King's Norton, 2nd, and Mrs. C. H. HERBERT, Acocks Green, 3rd.

Mrs. J. W. LEAVES, Nottingham, had the best 12 bunches of stove and greenhouse flowers, and Sir A. MUNTZ, Bart., Rugby, the best six bunches.

In a class for 12 bunches of annuals, the Rev. A. BROWN, Bedstone Rectory, Bucknell, was

awarded 1st prize, and Mr. A. MYERS staged the best six trusses of single, and six trusses of double Zonal Pelargoniums.

Messrs. R. HARKNESS & Co., Hitchin, won the 1st prize in a class for 24 Roses, and Messrs. PERKINS & SONS, Coventry, secured the premier award offered for 18 blooms.

There were three entries in a class provided for cut Roses, and of these Mr. GEORGE PRIMER, Oxford, was placed 1st. He had excellent blooms of Muriel Grahame, Killarney, Liberty, and Madame Abel Chatenay; 2nd, Mr. J. CROSSLING, Penarth, with a creditable display; 3rd, Mr. G. H. TOWNDROW, Malvern Link.

Messrs. BOTTOMLEY & BURTON, Elland, staged the best 24 Show or Fancy Dahlias, and Mr. F. BUNN, Newton, Ledbury, had the best 12 Cactus varieties in a class reserved for amateurs.

FLORISTS' DEVICES.

The 1st prize for a bride's bouquet with Orchids and two bridesmaids' bouquets without Orchids was won by Messrs. FELTON, Hanover Square, London. The bride's bouquet was composed of long sprays of Odontoglossums and two white Cattleyas. The bridesmaids' bouquets were made of pink Carnations; 2nd, Mr. W. J. GARNER, Hale, Altrincham.

The last-named exhibitor staged the best bouquet for the hand, and Messrs. PERKINS & SONS, Coventry, had the best bride's bouquet, Mr. W. J. GARNER, Hale, being second in the last-named class. He also took 1st prize for a bouquet for the hand (Orchids excluded).

The winning shower-bouquet of Cactus Dahlias came from Mr. W. TRESEDER, Cardiff, who used scarlet and cream-coloured flowers; 2nd, Mr. W. J. GARNER.

Messrs. FELTON & SONS took 1st prizes in the classes for a featherweight bouquet and a floral harp, with dainty examples in each case.

Messrs. POPE & SON, King's Norton, were awarded the 1st prize for a floral cross. The groundwork consisted of white Asters, over which flowers of the small bright scarlet Liliun chalcidonicum were arranged—a bold and pleasing contrast.

Messrs. POPE & SON, King's Norton, showed the leading basket of cut flowers (Orchids excluded).

VEGETABLES.

In spite of lamentations over an adverse season, not only were the collections in the respective classes far in excess of what have been seen in any previous year, but the quality of the best was quite up to the standard merit, and some capable critics thought it was better than ever. In any case the efforts of the society to popularise the vegetable classes (by first getting all the leading trade firms to put their classes on an equal footing, making them all for nine kinds only; and in the second place reducing their own chief class to the same number of dishes and offering for it greatly enhanced prizes, but specially in offering a champion prize of 10 guineas for the best collection of nine kinds in the show), proved to be remarkably successful, and with such response it is hoped this liberal action will be repeated.

It was interesting to note, however, that the champion prize fell to the 1st prize collection in the society's class. Hence no trade firm could feel any special gratification or sense of humiliation. The coveted prize fell to an excellent grower of vegetables in the person of Mr. J. GIBSON (gr. to the Duke of PORTLAND, Welbeck Abbey), who, joining together the society's 1st prize of £10 and the champion prize of 10 guineas, thus wins with nine dishes of vegetables the largest sum ever offered. The society published the information that to each dish shown for this champion prize a maximum of 7 points was to be awarded if merited. The actual awards were as follow:—

	Points.
Cauliflowers	7
Celery	5½
Leeks	6
Carrots	7
Onions	6
Potatos	7
Peas	7
Runner Beans	7
Tomatos	6½
Total	59

In the same class Mr. E. BECKETT, V.M.H. (gr. to Lord ALDENHAM, Elstree, Herts.), was 2nd, having in his collection capital Scarlet Perfection Carrots, Goldfinder Potatos, Musselburgh Leeks, and fine Celery. Mr. J. HUDSON, of Leicester, was 3rd; and Mr. B. ASHTON (gr. to the Earl of LATHOM, Ormskirk), 4th.

Messrs. Jas. Carter & Co.'s Class.—Here Mr. J. Dymock (gr. to G. D. FABER, Esq., M.P., Wallingford), was a good 1st, having fine Defiance Cauliflowers, Incomparable Celery, Holborn Model Leeks, Scarlet Perfection Carrot, Record Onions, Windsor Castle Potatos, Scarlet Emperor Runner Beans, Quite Content Peas, and Duke of York Tomatos. Mr. F. J. BARRETT, Overton-on-Dee, was 2nd with excellent samples. Mr. A. M. SEARLE, Castle Ashby Gardens, was 3rd, and Mr. ASHTON 4th. There were six collections in the class.

Messrs. Sutton & Sons' Class.—With five entries, several old competitors having fallen out, Mr. GIBSON was again 1st, having very fine Prizetaker Leeks, Autumn Mammoth Cauliflowers, Ailsa Craig Onion, Intermediate Carrot, Best of All Runner Beans, Perfection Tomatos, Centenary Peas, and Ideal Potatos. Mr. E. BECKETT, who was 2nd, had very fine examples of Prizetaker Leeks, Solid White Celery, Windsor Castle Potatos, also fine Cauliflowers, Peas, and Tomatos. Mr. J. HUDSON was 3rd, and Mr. ASHTON 4th.

Messrs. Webb & Sons' Classes.—Here, out of nine collections, Mr. BECKETT was a good 1st, having superb Champion Leeks, Mammoth Red Celery, Ailsa Craig Onions, Prizewinner Carrots, Stourbridge Marrow Peas, Jubilee Tomatos, Exhibition Runner Beans, Chieftain Potatos, and Mammoth Cauliflowers. Mr. J. DYMCK was 2nd, and Mr. BARRETT 3rd; other prize-winners in the class being Messrs. ASHTON, SEARLE, and BARSON.

Messrs. Bull & Sons' Class.—This competition brought but two competitors, Mr. DYMCK winning easily with fine dishes, these being practically repeats of what have already been mentioned. Mr. J. BARSON was 2nd.

Mr. R. Sydenham's class brought 12 collections, the 1st prize falling to Mr. S. J. Baker (gr. to Sir D. DUCKWORTH-KING, Exeter). He had Bibby's Defiance Leek, Autumn Giant Cauliflower, Excelsior Onions (very fine), Champion Scarlet Runner Beans, St. Valery Carrots, Gladstone Peas, Perfection Tomatos, and Factor Potatos. Mr. H. FOLKES (gr. to the Right Hon. J. F. HALSEY, Herts.), was 2nd; Mr. F. J. Clark (gr. to MARK FIRTH, Esq.), 3rd; and Mr. BARRETT 4th. No fewer than nine prizes were awarded in this class.

In the Society's class, devoted to the county of Salop alone, Mr. Mills (gr. to Captain HEYWOOD LONSDALE) was 1st.

Other collections were presented for prizes offered by Messrs. R. SMITH & Co., Worcester; Mr. E. MURRELL, Shrewsbury; Messrs. JAS. BACKHOUSE & Co., York; and Mr. J. WILSON, Hereford; but all the best exhibits have been mentioned.

Other classes for small collections or single dishes brought remarkable competition. The best three dishes of Potatos among 24 entries came from Mr. E. DEAKIN, Hay Mills, but unnamed. Mr. ASHTON came 2nd with excellent Monarch, Eighty Fold, and Duke of York. Mr. W. H. LEVETT, Wellington, being 3rd.

With a single dish, Mr. McPherson (gr. to the Earl of LONDESBOROUGH, York) was 1st. With six Tomatos, Mr. J. HUDSON, of Leicester, took 1st place. With a brace of Cucumbers, that veteran grower, Mr. J. LOCKIE, of Huntingdon, was 1st; Mr. BECKETT coming 2nd. Mr. BECKETT, however, was 1st for a dish of French Beans, and Mr. J. GIBSON had the best dish of Peas. The best Runner Beans came from Mr. DEAKIN, Cauliflower from Mr. D. THOMAS, Corend; Celery from Mr. FOLKES, Parsnips from Mr. BARKER, and Carrots from Mr. J. H. PUGH, Newtown.

It is not possible further to particularise the Awards which were in other classes very numerous, or to advert to the competition in the cottagers' classes, other than to mention the very fine quality seen in their exhibits.

NON-COMPETITIVE EXHIBITS.

Messrs. DOBBIE & Co., Rothesay, sent a large collection of Phloxes, Violas, and Pansies, also Sweet Peas and a few miscellaneous flowers.

Messrs. JAS. BACKHOUSE & SONS, York, had a nicely-arranged rockery planted with such things as Campanulas, Gentianas, dwarf Spiræas, and Podophyllum Emodi, bearing large scarlet, egg-shaped fruits. Dwarf shrubs were also employed with good effect, and graceful Bamboos formed a pleasing setting at the back.

Messrs. WALLACE & Co., Colchester, contributed one of their characteristic displays of hardy flowers, in which were excellent examples of Astilbe Davidii, Physostegia virginiana, Phloxes, hybrid Gladioli, new varieties of Montbretia, and several Liliums.

Mr. ALBERT MYERS, Sutton Lane Nurseries, Shrewsbury, sent Zonal Pelargoniums as growing plants and cut flowers.

Messrs. DICKSONS, Chester, staged a handsome group of hardy flowers, including superb examples of Romneya Coulteri, Scabiosa caucasica, Phloxes, and Roses.

Messrs. BAKERS Wolverhampton, had a comprehensive display of cut flowers, in which were hybrid Gladioli, Sweet Peas, Roses, single, show, Cactus and Pæony-flowered Dahlias.

The KING'S ACRE NURSERIES, Hereford, sent a splendid exhibit of fruit trees in pots, and gathered fruit. Among the trees we noted specimens of Jefferson and Magnum Bonum (white) Plum, Conference, Marguerite Marillat, and Louise Bonne of Jersey Pear, Worcester Pearman and Washington Apple, Gros Maroc and Lady Hutt Grape, and a well-trained fan-shaped Sea Eagle Peach, bearing 41 fruits. The same firm also had on another table a collection of Roses, Carnations, and miscellaneous flowers.

Messrs. ISAAC HOUSE & SON, Westbury-on-Trym, showed a pretty group of Phloxes and other hardy flowers.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, arranged a group of stove plants in one of the half-circular recesses in the marquee, containing the premier groups of miscellaneous plants exhibited in competitive classes. The plants were disposed in a manner frequently adopted by Messrs. VEITCH, the main characteristics of which consist in having wings composed of fine specimens of various species arranged over a Fern-covered ground and extending at the back of the group through the centre, but the front of the centre was composed of choice Orchids in flower, making at once a notable and showy feature in the display. The specimen plants were all of the highest cultivation. They included excellent Codiaums (Crotons), Dieffenbachia Jenmanii, Gleichenia dichotoima, Nephrolepis exaltata superba, several species of Davallia, Platycerium angolense, and other Ferns; Ixoras, Alocasia macrorrhiza variegata, Dracæna Sanderiana, Aralia elegantissima, Cocoloba pubescens, Ixoras, Tillandsia zebrina major (in flower), Anthuriums, Dracæna Victoria, Cordylines, Rhododendron javanicum-jasminiflorum hybrids, Ceratopetalum gummi-ferum, and beautifully-coloured plants of Phyllanthus nivosus and Bertolonia "Mme. A. Bleu." Over these plants were suspended well-pitched plants of Nepenthes Burkei excellens, N. Balfouriana, N. Mixta, and others. The firm had also a group of flowers of varieties of tree or winter-flowering Carnations, &c.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, Middlesex, furnished the similar recess on the opposite side of the marquee with a water garden, arranged with aquatic plants on either side of the water. The conception and execution of this exhibit were admirable. The water, though necessarily of small area, was ornamented with Nymphaea flowers and foliage, arranged in a perfectly natural manner; other aquatics were contained in suitable positions in the water, and gold-coloured fish could be seen gliding under the Nymphaea leaves in the most realistic manner. At the back and in the centre of the group were two or three specimens of Gunnera manicata, and the semi-aquatic plants throughout the exhibit were justified in their selection, and their disposition was carried out with knowledge of the habitat of each species.

Mr. E. MURRELL, Shrewsbury, staged a magnificent collection of Roses and several boxes of Gladioli.

Messrs. WEBB & SONS, Stourbridge, set up an assortment of fruit, vegetables, cut flowers, and small plants of Gloxinias.

Messrs. JONES & SONS, Shrewsbury, staged a large collection of Sweet Peas, Carnations Zonal Pelargoniums, and floral devices.

Mr. ROBERT SYDENHAM, Birmingham, showed Sweet Peas in rustic stands and other receptacles.

The most extensive collection of Sweet Peas came from Mr. HENRY ECKFORD, Wem, Salop. From Messrs. J. STARK & SON, Great Ryburgh, Norfolk, came a pretty stand of Sweet Peas, including some unnamed seedlings.

MESSRS. HOBBIES, LTD., Dereham, Norfolk, filled the whole of one side of the centre stage in one tent with a particularly good exhibit of Roses as growing plants and cut blooms. Sweet Peas and Dahlias were also well shown.

MESSRS. WEBB & BRAND, Saffron Walden, sent a number of excellent spikes of Hollyhocks, &c.

MESSRS. HUGH LOW & CO., Bush Hill Park, N.E., made a good display with flowers of American varieties of Carnations. Also Orchids, Ericas, Roses, Figs in pots, and Orange bushes bearing fruit.

MESSRS. WATSON & SONS, Clontarf Nurseries, Dublin, had a dainty arrangement of choice cut Carnations.

MESSRS. T. ROCHFORD & SONS, Broxbourne, Herts., exhibited a large group of well-grown plants of *Nephrolepis todeoides* and two specimens of the new pink-flowered *Spiraea Peach Blossom*.

MESSRS. RICHARD SMITH & CO., Worcester, showed a miscellaneous collection of indoor and outdoor flowers and hardy shrubs.

MESSRS. ALEX. DICKSON & SONS, Newtownards, had a very bright collection of Roses.

MESSRS. GUNN & SONS, Olton, had a fine lot of shrubby Phloxes in many choice varieties.

MESSRS. HEWETT & CO., Birmingham, had a collection of hardy flowers.

Mr. J. FORBES, Hawick, N.B., contributed Pentstemons in numerous and excellent varieties, also Phloxes and Carnation flowers; these latter exhibited on cardboard.

There were many other non-competitive exhibits, but we have not the space to refer to them in detail.

HONORARY AWARDS.

LARGE GOLD MEDALS.

Jas. Veitch & Sons, Ltd., Chelsea, S.W.; Amos Perry, Enfield; King's Acre Nurseries, Ltd., Hereford; Edwin Murrell, Shrewsbury.

SMALL GOLD MEDALS.

Thos. Rochford & Sons, Ltd., Broxbourne; Robert Bolton, Carnforth; James Backhouse & Sons, Ltd., York; Bakers' Nurseries, Codsall, Wolverhampton; E. Webb & Sons, Stourbridge; Jones & Sons, Ltd., Shrewsbury; Hobbies, Ltd., Dereham; Henry Eckford, Wem; George Bunyard & Co., Ltd., Maidstone.

SILVER-GILT MEDALS.

Gunn & Sons, Olton, Birmingham; L. R. Russell, Richmond; Richard Smith & Co., Ltd., Worcester; John Peed & Son, Roupell Park Nurseries, Norwood, S.E.; Dobbie & Co., Rothsay, N.B.; R. Wallace & Co., Kilnfield Gardens, Colchester; Dicksons, Ltd., Chester; Isaac House & Son, Westbury-on-Trym, Bristol; Robert Sydenham, Tenby Street, Birmingham; Alex. Dickson & Sons, Ltd., Newtownards, Co. Down; Geo. Prince, Longworth, Berks.

SILVER MEDALS.

Hewitt & Co., Ltd., Solihull; John Forbes, Hawick; Clibrans, Altrincham; John Mattock, Oxford; Hugh Low & Co., Enfield; Thos. W. Darlington, Carnforth; Webb & Brand, Saffron Walden; Albert Myers, Shrewsbury; Felton & Son, Hanover Square, W.; G. Stark & Son, Great Ryburgh; W. & J. Brown, Peterborough; Jarman & Co., Chard; Pritchard & Son, Shrewsbury.

BRONZE MEDALS.

J. Cooper, Chipping Norton; H. N. Ellison, West Bromwich; B. R. Davies & Sons, Yeovil; Vincent Slade, Taunton; Wm. Watson & Sons, Ltd., Dublin; W. L. Pattison, Shrewsbury; A. W. Thorpe, Lichfield; A. Bastock, Moseley; John E. Knight, Wolverhampton; Hugh Aldersey, Esq., Chester.

AWARDS OF MERIT

were awarded to Mr. Amos Perry, Enfield, for *Tamarix Hispidula* 'Estivalis'; Messrs. Alex. Dickson & Son, Newtownards, Co. Down, for *Rose W. E. Lippiatt* and *Rose Harry Kester*;

to Mr. L. R. Russell, Richmond, for *Hedera dentata* variegata; to Hugh Aldersey, Esq., Chester, for Sweet Peas "Syeira Lee" and "Helen Grosvenor"; and to Messrs. Dobbie & Co., Rothsay, for Phlox "The Queen."

DEBATING SOCIETIES.

PITSFORD & DISTRICT HORTICULTURAL.—This society held its first flower show in the grounds of Pitsford Hall on Thursday, August 8, by permission of Mr. H. E. Courage; and so successful was the initial effort that it will doubtless become an annual function. After settling all accounts a balance of £30 remained.

PETERBOROUGH AND DISTRICT HORTICULTURAL.—The 2nd annual exhibition of this society was held on Wednesday, August 14. The entries numbered 903, compared with 395 last year. Unfortunately the patronage the show deserved was ruined by rain. The exhibits generally were of a high order. The strongest section in the show was that for Cottagers, the produce in these classes being exceptionally good.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 21.

A cold and wet week.—For more than a fortnight the days have all been more or less unseasonably cold. During the same period, however, the nights proved as a rule rather warm. On the warmest day of the past week the highest reading in the thermometer screen was only 70°, and on the coldest day never exceeded 60°. On the two coldest nights the thermometer exposed on the lawn indicated readings within respectively 8° and 7° of the freezing point. At 2 feet deep the ground is still 2° colder, but at 1 foot deep is now 4° colder, than is reasonable. Rain fell on each day of the week, the total fall exceeding three-quarters of an inch. On one day, during a thunder-shower, rain was falling for three minutes at the average rate of an inch an hour. These rains have not proved sufficiently heavy to re-start the percolation gauge on which short grass is growing, through which no measurable quantity of rain-water has now passed for a fortnight. Small quantities have, however, come through the bare soil gauge on each of the last three days. The sun shone on an average for 6 hours a day, which is three-quarters of an hour a day more than is usual in August. The winds were again high, but as was the case in each of the two preceding weeks in no hour did the mean velocity exceed 14 miles, direction west. The average amount of moisture in the air at 3 o'clock in the afternoon was three per cent. in excess of a seasonable quantity for that hour. *E. M., Berkhamsted, August 21, 1907.*

REMARKS.—Large supplies of English hot-house grown Grapes are arriving, but the demand for them is moderate. Plums from Kent are plentiful, and prices remain about the same as those of last week. French and Spanish Gages are much dearer, notwithstanding that the bulk of them arrive in an unsound condition. A good demand exists for large English culinary Apples. *P. L., Covent Garden Market, August 21, 1907.*

POTATOS

Kents, 3s. to 3s. 6d. per cwt.; Bedford, 50s. to 70s.; Lincolns, 50s. to 75s.; Blacklands, 45s. to 55s. per ton. Supplies are shorter and prices are firmer. *G. B., Covent Garden, August 21, 1907.*

COVENT GARDEN FLOWER MARKET.

There is now very little trade in plants. Good specimens of *Hydrangeas Hortensis* and *paniculata* are procurable. Pelargoniums are nearly over for the season, except the zonal varieties, which are still very good. Chrysanthemums are now of much better quality, and some good plants are seen. Chrysanthemum segetum and the white-flowered Marguerites are prominent subjects, also *Spirea japonica* and *S. astilboides* "Silver Sheath." Lilies, including *L. longiflorum* and *L. lancifolium rubrum*, are of the best quality. Verbenas are still abundant, also Asters in pots. Campanulas have been remarkably good this season. Dahlias in flower in 48 size pots are seen. Roses are almost over for the season. Ferns in various sizes are well supplied. *Asplenium nidus* is very good. The new *Nephrolepis Todaeoides* can be had, but the price is high. *N. Piersonii* can now be purchased at the same prices as commoner sorts. A considerable trade is done in Palms of small sizes, but most of the large ones remain unsold.

CUT FLOWERS.

Chrysanthemums are now very prominent. Lady Fitzgibbon is one of the best "whites," and if disbudded *Horace Martin* is the best "yellow." Some good bronze and pink varieties are also seen. Carnations are still plentiful, and many are purchased by the hawkers. Lilies remain at low prices; the blooms of *L. rubrum Melpomene* are of a beautiful colour. Roses are still over abundant, the variety *Mrs. J. Laing* is one of the most conspicuous. *Perle de Jardins* is the best yellow variety in the market, and *Liberty* the best red; *Kaiserin Augusta Victoria*, *The Bride* and *Frau Karl Druschki* are all good white varieties, and *Niphetos* is still extensively grown. *Gladioli Colvlei* "The Bride" is arriving from Holland in large quantities. Orchid bloom is plentiful, but the demand is poor. Hardy flowers are seen in large quantities, and many are wasted. Small growers who bring in cut flowers at this time of the year complain very much; they state that trade in bedding plants was bad, but the flower trade is worse. *A. H., Covent Garden, Wednesday, August 21, 1907.*

SCHEDULES RECEIVED.

SANDY FLOWER SHOW, to be held on Thursday, August 29. KENT, SURREY AND SUSSEX DAFFODIL AND SPRING FLOWER SOCIETY'S 3rd exhibition, to be held about the 2nd week in April, 1908, at the Great Hall, Tunbridge Wells.

LONDON DAHLIA UNION'S exhibition, to be held in the Royal Botanic Gardens, Regent's Park, on Thursday and Friday, September 12 and 13, 1907. Secretary, Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, N.W.

NATIONAL DAHLIA SOCIETY'S exhibition, to be held at the Crystal Palace, on Thursday, September 5, 1907.

ANSWERS TO CORRESPONDENTS.

APPLES CRACKING: *L. F.* If you will forward us specimens, we will endeavour to ascertain the cause of the trouble. Bordeaux mixture is the best remedy for Pear scab at this season. Next spring drench the trees before the buds expand with a solution of sulphate of iron.

CANADIAN PAPER: *H. B.* The Canadian Horticulturist, 507 & 508, Manning Chambers, Toronto, Canada.

CLEMATIS: *J. S.* The stem and leaves do not furnish any clue to the cause of failure. There is no trace of fungi, or insects. There must be some local cause. Are you sure that the roots are growing in suitable, well-drained soil?

CLOVER IN LAWNS: *W. F.* Apply some nitrogenous manure to the lawn. This will favour the growth of the grasses, and they will in time crowd out the Clover.

CORRECTION: In the report of the Bishop's Stortford Flower Show on page 117, the winner in the Grape classes should have read Mr. J. BALFOUR, Moor Hall, Harlow, Essex (gr. Mr. A. Jefferies), and not Colonel BALFOUR.

CYCAS REVOLUTA: *H. V.* It is not unusual for this plant to develop its cones in plant houses. We have on several occasions published illustrations of the plant bearing its inflorescence in gardens in this country.

EXHIBITING CUT FLOWERS: *H. F.* *Campanula carpatica* and *C. persicifolia* are distinct species. According to the *Rules for Judging*, issued by the Royal Horticultural Society, which states that "as a general rule all variations within a genus are varieties," your exhibit of these plants as distinct varieties would be legitimate. However, to avoid dispute it would be well not to include the two *Campanulas* if you can substitute some other flower.

GRAPES: *J. C. McC.* The disease is probably the Anthracnose (*Gloeosporium ampelophagum*) but in an early stage, and no spores are formed.

LAUREL LEAVES: *A. W. K.* Your Laurel leaves exhibit just such holes as are caused by the shot-hole fungus (*Circospora circumscissa*), but there is no trace of fungus in the leaves, and no indications of insects, so that the cause of the holes cannot be determined.

LYCHNIS: *E. H.* We have examined your plants carefully and find no trace of fungi, but suspect that the cause of the mischief lies in the roots. Are you sure that it is not Eelworms? The old-fashioned plant known as *Monarda didyma*, and having brilliantly red flowers, might be given a place in the border. It is a perennial plant and grows about 2 feet high.

MELON DIAMOND JUBILEE: *Enquirer.* This variety was raised at Dropmore by Mr. Charles Hettin in 1897, and it received an Award of Merit from the Fruit and Vegetable Committee of the Royal Horticultural Society on May 26, 1897. Seeds were forwarded to Wisley for trial by Messrs. Hurst & Son, Houndsditch.

NAMES OF FRUITS: *P. J. P.* Your Grapes arrived in a smashed condition. Send others properly packed and we will endeavour to oblige you. At the same time enclose a portion of the shoot and a few leaves.

NAMES OF PLANTS: *H. T. S.* 2, *Cuscuta europæa*, the Dodder; 3, *Erica cinerea*. The caterpillar is the larva of the Death's Head Hawk-moth, *Acherontia atropos*.—*F. M.* 1, *Brassavola acaulis*; 2, *Cyrtopodium Andersonii*; 3, *Odontoglossum Lindleyanum*.—*Constant Reader.* 1, *Olearia Haastii*; 2, *Lythrum salicaria*; 3, *Anchusa italica*; 4, *Linaria vulgaris*; 5, *Piptanthus nepalensis*; 6, *Teucrium polium*.—*C. E. H.* 1, *Lastrea cristata*; 2, *L. c. uliginosa*; 3, *L. spinulosa*; 4, *Athyrium Filix-femina purpurescens*; 5, *A. f. rhaticum*.—*G. M.* (a) *Anthemis tinctoria*; (b) *Galega officinalis*; (c) not recognised; (d) *Camassia esculenta*; (e) *Physostegia virginiana*; (f) *Origanum Dictamnus*.—*J. M.* 1, *Inula grandiflora*; 2, *Sedum hispanicum*; 3, *Lastrea lepida*; 4, *Lastrea serra*.—*H. T.* *Veronica Andersonii*, purple variety. *H. P. P.* 1, *Begonia Dregei* (syn. *parvifolia*); 2, *Begonia fuchsoides*; 3, *Achillea ptarmica*, double variety; 4, *Cryptomeria japonica*.—*H. A.* *Abelia triflora*.—*Fresco.* 1, *Hypericum uralum*; 2, *Osmunda gracilis*; 3, not recognised; 4, *Liatris spicata*; 5, *Veronica longifolia subsessilis*; 6, *Polystichum aculeatum*.

PEACHES: *C. A. B.* and *G. M.* Your Peaches appear to be attacked by a black mould, which was first observed and described by Berkeley in 1864, in *Gardeners' Chronicle* for that year (p. 938) with a figure, under the name of *Helminthosporium*

rhaldiferum—found on ripe Peaches from Wales. It is very doubtful whether it has been recognised since that date. At first it was called *Macrosporium*, but the spores are not muriform, and there are very few threads. Technically it is doubtful whether it is either *Helminthosporium* or *Macrosporium*—but the

FIG. 62.—MACROSPORIUM RHALDIFERUM: A DISEASE OF PEACHES.

spores are very profuse, and, though rare, the fungus is a decided pest. Pick off and burn at once all diseased fruits, and syringe the trees with diluted Bordeaux mixture to destroy stray spores.

PLUMS: *J. McC.* Your Plums appear to be infected by Anthracnose, similar to *Gloeosporium laticolor*, which occurs on Peaches, but with smaller spores. It is probably a species not hitherto recognised. Gather and burn all the diseased fruits. For the present the parasite may be called *Gloeosporium prunorum*, the spores being 10 to 12 mm. long.

POTATO WITH AXILLARY TUBER: *J. C.* The specimen you send is not uncommon. The underground tuber of a Potato is nothing more

FIG. 63.—TUBER GROWING ON THE HAULM OF THE POTATO.

than a modified stem or shoot, and it is not surprising that these thickened shoots should sometimes be produced above ground.

ROSA RUGOSA: *G. N.* The shoots you send appear to be those of the species you are cultivating.

TOMATOES DISEASED: *H. J. G.* From your description the disease appears to be *Cladosporium fulvum*. Syringe the foliage with Bordeaux-mixture (see p. 150), afford an abundance of ventilation, and, on cold nights, circulate a little heat in the hot-water system.

COMMUNICATIONS RECEIVED.—*C. H. J.*—*H. H.*—*E. M.*—*R. A. B.*, San Remo—*J. G.*—*W. G.*—*A. W.*—*W. H.*—*S. W. T.*—*F. B.*—*W. C.*—*A. B.*—*G. C.*—*Mrs. R.*—*R. H. C.*—*J. D. G.*—*Hon. W. R.*—*G. B. THE COUNTRY GARDEN.

THE country garden that has for one of its main features the flowering trees and shrubs is generally a beautiful garden. It may be large and rambling, or it may be of but medium size, but there is, as a rule, something in its setting—that is to say, its surroundings—that seems especially to accompany a generous supply of flowering trees and shrubs.

A well-grown shrub in full blossom is, in many cases, a means of getting a mass of colour in a particular spot that would not otherwise get the brightening effect of colour, as it does not contain either bed or border. This, I cannot help thinking, is highly important and a point no good gardener with an eye to decorative effect can afford to overlook. Another consideration lies in the fact that by this means we can secure considerable masses of colour at different elevations, and when colour can be secured above the level of the eye it has a distinct and appreciable value for distant decorative effect.

This makes me say that a tall, flowering

tree, or shrub, at the far end of a long vista has more value than the same amount of blossom would have laid down in a flat bed or border. And if, at the same time, some of the more uncommon flowering shrubs are made use of, then much additional interest is added to the garden.

There is just one other point I want to notice before I go on to name a few desirable varieties, and that is, that where space suffices for a good number, it is well to secure a selection that will flower over a long period. Those favourite flowering trees the Lilacs, Guelder Roses, Philadelphus, white or red Thorn, and Laburnum unfortunately flower more or less simultaneously, and, as these are the trees and shrubs that are planted most largely, and often to the neglect of all other species, it follows that, though brilliant for a short season, the flowering of trees and shrubs cannot be reckoned on as an effective factor in the beauty of such gardens except in the early summer. We ought to seek to remedy this, to discover varieties of both trees and shrubs that carry the flowering season much farther into the year, both earlier and later.

White is far more usual as the colour of the blossom of trees and shrubs—and after that, I suppose yellow—than brighter and fuller colours.

A beautiful, even a striking subject for a sheltered position is Magnolia stellata. Comparatively dwarf in growth, its glistening white blossoms are opened in March, and, from their curious narrowness, the petals have a strap-like effect. For beauty there is scarcely another shrub to compare with this, and I mentioned "a sheltered position" not at all by reason of any tenderness of the shrub, but merely because in a wind-swept spot the pure white flowers may be bruised and partly ruined. Earlier still to flower is the valuable Forsythia. I cannot help thinking that the species *F. suspensa* has too greatly taken the place of *F. viridissima*. We use the former as a wall subject, and seem to forget that *F. viridissima* makes a capital early flowering shrub for an open position.

Instinctively, almost, we regard the country garden as, at the same time, the old-fashioned garden, and, therefore, it seems to me that any shrub that especially can be looked upon as old-fashioned is peculiarly suitable. Among these must be named the brilliant, orange-flowered single and double Kerria, and it may be added that the flowering period of the double form is twice as long as that of the type. This Kerra is in flower with the Forget-me-nots, and a great mass of the blue flowers of Forget-me-nots under the flower-laden, orange-coloured shrub is as effective in spring as anything could be.

For July and August flowering—the months, by the way, when flowering shrubs are particularly an addition to the garden—there is *Olearia Haastii*. It is evergreen and worthy of really good cultivation. A shrub 5 or 6 feet high, under happy conditions, it should be, by the beginning of August, a dense mass of white flowers, and those who delight in seeing the bees at work in their gardens will find an additional charm in this shrub, as the bees love it.

Another good old-fashioned subject is

Hibiscus syriacus, known in former times as *Althea frutex*. There is a double form with pink flowers much to be recommended. The shrub shows, however, a diversity of colouring, its range being from pure white, as *H. Jeanne d'Arc*, to deep dark red, as in the variety *Boule de Feu*. When I first purchased *H. syriacus* I was told to plant it in a dry, warm spot; that, however, is the greatest mistake. To flourish as it should, the soil should be deep, rich, and moist.

I always look upon *Colutea arborescens* as a valuable addition to the summer-flowering shrubs. Practically, it will grow anywhere, and it is decorative for a long period, first with its blossom, and later with its inflated seed vessels. Its delicate lightness makes it charming among evergreens. Its introduction into England dates back to the 16th century, so that it ranks easily among the old-fashioned shrubs, and, like so many shrubs that have that distinguishing subtitle "arborescens," there is a dignity about it that is impressive. The Allspice or Calycanthus is not striking, but it is soberly and quaintly pretty, and uncommon, both in the deep rich colouring and in the form of the flowers. The plant is of compact habit and neat in growth, flowering from mid-July.

Practical Gardener.

NEW OR NOTEWORTHY PLANTS.

BULBOPHYLLUM BINNENDIJKII,
J. J. SMITH.

At the Temple Show this year Messrs. Sander & Sons showed in their group of Orchids a very striking plant under the name of *Bulbophyllum Ericssonii*. On seeing it I was at once impressed by its differing greatly from the type plant of *B. Ericssonii*, which flowers freely at Tring Park every year, and which was illustrated in the *Gardeners' Chronicle*, January 23, 1897, p. 61. The most obvious difference was the rigid, upright position of the odd or dorsal sepal, the larger, purple spots on this and the remaining segments, and the darker colour of the lip. On an examination of the distinguishing characters of the species of this section of *Bulbophyllum*, viz., *B. Ericssonii*, *B. virescens*, *B. Pahudi*, *B. galbinum* (illustrated in the *Gardeners' Chronicle*, July 20, 1907, from the Tring Park specimen), and *B. uniflorum* = *B. Reinwardtii*, I found that Messrs. Sanders' plant is *Bulbophyllum Binnendijkii*, J. J. Smith = *Cirrhopetalum leopardinum* T. and B.

In addition to the above-named species of this group, there are at least two forms grown in English gardens under the name of *Bulbophyllum virescens*, which most likely are unnamed species, but I shall have a further communication on this highly interesting section to make later on, when the status and synonymy of the species, and also the question of the two genera *Cirrhopetalum* and *Bulbophyllum*, will be thoroughly discussed. *Walter Rothschild.*

ZALUZIANSKIA MARITIMA.

THIS pretty little plant was raised from seed sent to me by my esteemed correspondent, Mr. G. Thorncroft, of Barberton, Transvaal. The name sent with the seed of *Zaluzianskia* was evidently incomplete, but on its blooming and being sent to the Herbarium at Kew for identification I was told that its correct name was *Z. maritima*. I was also referred to plate 2,504 of the 51st volume of the *Botanical Magazine*, where it is figured under the name *Erinus Lychnidea*, or the Phlox-like *Erinus*. The portrait of the flower there given agrees with

my plant in every detail except the colouring of the exterior of the petals, which in the plate are depicted purple, almost black, whereas in my flowers these are a deep shade of red. The interior of the bloom is pure white, and when the flowers open quite flat at about sunset they present a very pretty appearance. They remain closed throughout the day. *W. E. Gumbleton.*

ORCHID NOTES AND GLEANINGS.

ARPOPHYLLUM GIGANTEUM.

IN a paragraph published in the issue of *Gardeners' Chronicle* for June 15 last, p. 378, on *Arpophyllum giganteum*, the habitat was given as Mexico and Guatemala. Looking up *Index Kewensis*, I find it also given there as Mexico. But Mr. G. Lyme, when curator of Castleton Gardens, 1879-85, found *A. spicatum* indigenous to Jamaica, and specimens were collected for the Jamaica Herbarium. The West Indian habitat should be, therefore, added to the records for *Arpophyllum*. *J. H. Hart, F.L.S., Botanical Dept., Trinidad.*

CYPRIPEDIUM PARISHII.

A NUMBER of strong specimens of this distinct *Cypripedium* have been flowering in the collection of A. J. HOLLINGTON, Esq., Forty Hill, Enfield (gr. Mr. Ayling). Several at present in bloom have from six to eight flowers on a spike, and all are expanded at the same time. It is a native of Moulmein, and its broad, green leaves make it an attractive plant even when not in bloom. The flower-spikes are some 15 inches in height, and bear from three to eight flowers each. The sepals are yellowish-green, and the drooping, twisted petals, which are about 5 inches in length, are tinged with purple and bear on the margins hairy, wart-like protuberances. The lip is green, stained with purple. Although not one of the showiest *Cypripediums*, it is highly attractive. This species is often said to be shy-flowering, but Mr. Ayling, with whom it flowers well every year, considers that the fact that it is generally kept in too warm and close an atmosphere accounts for its failure to flower in many cases. At Forty Hill, C. Parishii, C. Rothschildianum, and others of the section, are grown as intermediate-house plants, and all produce their flowers in great profusion. The leaves are shorter and of thicker substance than on plants grown in warmer houses. *J. O'B.*

ODONTIODAS.

By an unexplainable inadvertence in my article on *Odontiodas*, published on page 142 in last week's issue, I omitted to include in the table, the record of one of the most important plants of the family, thus—*Odontioda Bradshawii* (C. Noezliana \times Od. crispum), Charlesworth, R.H.S., January 8, 1907, F.C.C. The plant itself was prominently mentioned in the text, but that was not in itself any reason for its non-inclusion in the proper place in the table. *de B. Crawshaw.*

Accuracy is a matter of the highest importance, and I regret that in the transcription of a hasty note anything should have appeared that rendered necessary the correction made by Mr. Crawshaw at page 143 of your last issue. Mr. Crawshaw writes: "At that time I had plants of three *Odontoglossums* crossed with C. Noezliana, hence it was unlikely I should have stated it could not be effected." But the curious thing is that he did not state this at the time, when we discussed this very matter, and when capsules and seedlings from the reverse cross were pointed out. The second note "did not fully solve the question," because Mr. Crawshaw declined to allow the crosses he had made, to be published, and gave reasons for doing so, but as he has now published them the matter is set at rest. Let us hope these will be successful. Too many have not been

so, as Mr. Crawshaw himself points out. Finally, is it quite certain that *Cochlioda Noezliana* was the "male or pollen parent" of *Odontioda Vuylstekeae*, as Mr. Crawshaw states? M. Vuylsteke was himself uncertain, for "the cross was made both ways, and at first it was feared that the seeds had failed to germinate." See *Orchid Review*, Vol. xii., page 190. The information came from M. Vuylsteke. Can any one report seedlings from *Odontoglossum nobile* (Pescatorei) as the mother? The cross must surely have been frequently made during the last three years, and the reverse cross has succeeded in several places. *R. A. Rolfe.*

TREES AND SHRUBS.

ESCALLONIA PTEROCLADON.

THIS species, which is one of the most hardy and showy of the genus, is at present flower-

hardy. *Escallonia pterocladon* is easily propagated from seeds which ripen freely on the plants in the autumn. *W. Smith, Royal Botanic Gardens, Edinburgh.*

NERIUM OLEANDER.

THIS beautiful evergreen shrub, of which there are several varieties, both single and double-flowered, should be more commonly grown than it is. It is especially suited for the decoration of a verandah and for standing in tubs and pots grouped in sunny spots in the garden. When grown in the shade, the wood rarely becomes ripened, and bloom is then rare. If placed on the turf it is better to sink the receptacle in which it is grown. Cuttings of ripened wood taken at this season root readily, and if they are potted when rooted and kept in a greenhouse during the winter, planted out-of-doors the next year, and freely syringed in dry weather they will make good plants in two years. Some

FIG. 64.—ZALUZIANSKIA MARITIMA: FLOWERS DEEP RED AND WHITE.
(Longitudinal section of flower and mouth of tube $\times 2$, pollen grains $\times 300$.)

ing profusely in these gardens. The specimen is planted at the foot of a south wall, and has reached to a height of over 10 feet, and so freely are the inflorescences produced that the whole plant appears wreathed in its white flowers. These individually are very small, and the earliest appeared at the beginning of July on the current year's shoots either singly or in threes, in the axils of the small myrtle-like leaves. They are white, slightly tinged with pink, and they are slightly fragrant. The small lanceolate-shaped leaves at the base of the flowering shoots are about 2 inches in length, but they gradually merge into minute bracts towards the apex. The species is a native of Western Patagonia, and is commonly known as the winged-branched *Escallonia* on account of its angular stems, but the wings are present on the younger shoots only, as the older ones shed their bark. This plant will flower freely in the open when trained in bush form, for it is quite

stopping of the shoots is necessary, so as to promote a bushy habit. *F. M.*

THE SPRUCE GALL MITE.

A CURIOUS fact in connection with this pest is that it is very slow to go from tree to tree, even when the trees are in close proximity to each other. For the past nine years I have had under observation four young trees planted in line, and not more than 5 feet apart from each other. When I first noticed them they had been recently planted, and were all of nearly equal size. Now, the largest tree, which has never shown any signs of affection, though its branches are mixed up with those on either side of it, is about 11 feet high; the best of the others is only 5 feet, and the worst, which is almost covered with the galls, is not more than 3 feet high, though it is still alive, and makes an annual attempt to grow. Is there any explanation as to the immunity of the one tree? *J. C. Tallack.*

KEW NOTES.

THE GREENHOUSE.

VARIOUS species and varieties of Begonias form a prominent feature in this house at the present time. Large specimens of *B. echinosepala* in 12-inch and 14-inch pots are 6 feet in height and well furnished with flowers and foliage. In general appearance the plants resemble the well-known *B. metallica*. The red-flowered *B. coccinea* gives promise of continuing to flower for some time to come. It is trained up one end of the house, and is also growing in pots. Large plants of the hybrid *B. President Carnot* are carrying large racemes of rosy-carmine flowers. The pendulous trusses of rich, scarlet flowers of *B. coccinea* have a stately yet graceful habit quite distinct from the surrounding plants. Both growing in pots and as a plant for hanging-baskets, *B. Knowsleyana* is valuable with its clusters of pinkish-white flowers. A group of the dwarf-growing *B. Weltoniensis* is prominent on one of the side stages. *B. Dregei* (white) is an excellent cool

help to add variety to the house. Abutilons, Fuchsias, and Zonal Pelargoniums are all grown in this manner. Amongst the Pelargoniums, the variety *Mikado* is especially good. A large specimen of *Datura* (syn. *Brugmansia*) *Knightii* is very handsome with large, pendulous, double-white flowers. The blooms are delightfully fragrant, and perfume the air all around, so strong is the scent. A number of plants of *Lilium sulphureum*, planted out in the beds, are opening the first flowers. One in particular is very vigorous, being 11 feet in height with 10 flowers. Large specimens of *Crinum Powellii* var. *album* are conspicuous with pearly-white flowers. Several plants of *Eucomis punctata* are carrying a number of racemes thickly clothed with greenish flowers.

Plants arranged on side stages.—The usual arrangement here is to have a group of one, or sometimes two, species or varieties mixed. In this way the character and beauty of the plant is better seen than when all the plants are mixed together. The erect-growing *Clerodendron fallax* is represented by a group of seedling plants about one year old.

in whorls. Plants may be raised annually from seeds, or propagated by division. Other plants in flower are *Scutellaria Mociniana*, having scarlet flowers tipped with golden-yellow; *Cuphea micropetala*, a shrubby species in which the scarlet calyx, yellowish at the apex, is more prominent than the petals; *Sollya parviflora* (syn. *S. Drummondii*), *Impatiens Holstii*, &c.

Climbers.—These are valuable in a greenhouse and conservatory, especially in large structures, to clothe bare pillars and relieve the appearance of the roof. The following plants are at present in flower. The climbing *Dahlia Hidalgo Wercklei*, *Lantana salvifolia* (syn. *S. delicatissima*) seems to be always in flower, *Ipomæa rubro-cœrulea*, *Lapageria rosea*, *Passiflora cœrulea* and var. *alba*, *Rhodochiton volubile* [hundreds of flowers hanging in festoons from the roof], *Fuchsia simplicicaulis*, and several garden varieties. The foregoing, and a number of plants in baskets, add greatly to the beauty of the house. Growing in baskets are *Alonsoa incisa*, *Clianthus Dampieri* and the variety *tricolor*, *Campanula isophylla*, *Achimenes*, *Fuchsias*, and several species of *Asparagus*. *D. D.*

JUNIPERUS CHINENSIS AT ROOD ASHTON.

FIG. 65 affords a view of a remarkable tree of *Juniperus chinensis* with a globose habit, growing in the gardens at Rood Ashton, Wiltshire. The tree is about 25 feet in height, and the spread of its branches measures 30 feet. The date of its planting is not known with certainty, but the tree is considered to be about 80 years old. The specimen occupies an exposed position at the extreme boundary of the lawns facing to the south-east. Several other well-developed trees are found on the lawns, not the least conspicuous being some fine specimens of *Cedrus atlantica*. The soil in this portion of the estate is of an extremely fertile nature, being a very deep sandy loam overlying a rock formation.

The Juniper under notice presents quite a varied tone of colour at different periods of the year. In the earlier years of its existence it appears to have been shaded by other trees, so that the lower branches have been lost. The stem near to the ground has a girth of more than 4 feet. Though the tree is of fairly well-balanced proportions, it appears to lack a "leading" shoot, and this has probably largely accounted for its breadth being greater than its height. The peculiar contour of this Juniper engages the attention of visitors. *W. Strugnell, Rood Ashton Gardens, Wiltshire.*

THE ALPINE GARDEN.

HYPERICUM REPTANS.

It is surprising that no reference is made to this very beautiful species of *Hypericum* in the gardening books, including Nicholson's *Dictionary of Gardening*, as the species is among the prettiest and best of the smaller St. John's Worts for the rock garden. Its habit is prostrate, and it forms a trailing carpet of greenery that is spangled here and there with the clear yellow flowers, each of which is about an inch across. It does not succeed in a very dry place in summer, and the soil about it should not be too moist in winter. In a position that is fully exposed, the plant may suffer from cold in a hard winter. My experience is that it thrives much better in partial shade, in a position such as is afforded on the north or north-east side of a rockery, provided some shelter is available to protect it from cold winds. Although this species is removed with difficulty after it becomes established, I have succeeded in shifting large plants by giving them a good soaking with water, pressing the soil about the roots and removing them at once to their new quarters. *Hypericum reptans* is a native of the Himalayas. The stock may be increased either by means of cuttings or seeds. *S. Arnott, Dumfries.*

FIG. 65.—JUNIPERUS CHINENSIS AT ROOD ASHTON, TROWBRIDGE.

greenhouse Begonia. A hybrid which is useful for the greenhouse and also for bedding is *B. Corbeille de Feu*, with red flowers. It is a hybrid between *B. semperflorens* and *B. fuchsoides*. The plants of *B. nitida alba* average 3 feet in height, with numerous panicles of white flowers, well set off by the large, shining green leaves. Perhaps the best species to grow as a basket-plant is *B. glaucophylla*. The stems are naturally drooping, and the flowers are of rose-red colour. The yellow-flowered species *B. Davisii* is also in flower.

Tall-growing plants.—The following are some of the showiest and most interesting plants arranged in the centre beds of the house. With the exception of one plant of *Impatiens Oliveri*, the whole of the central bed is filled with the Chimney *Campanula* (*C. pyramidalis*), principally the blue variety mixed with double Tuberoses. *Calceolaria Burbidgei* is represented by well-flowered plants 6 feet in height. Yellow, such as is seen in the flowers of this *Calceolaria*, is always a pleasing colour in the greenhouse. Various plants grown as standards

The panicles of bright scarlet flowers, rising here and there amongst the white flowers of *Campanula Vidalii*, are displayed to perfection. The latter plant is very distinct and chaste in appearance. Treated as a biennial, this is a valuable plant for the cool greenhouse and conservatory, also for the flower beds or borders in August. During winter the plants can be grown in a cold frame, if protected from severe frosts by a covering of mats. The willow-leaved *Angelonia*, *A. salicariæfolia* (syn. *grandiflora*) is a pretty, blue-flowered greenhouse perennial. It may also be treated as an annual. The white variety *alba* is also here in flower. A plant little known in gardens is *Dianthera nodosa*. It requires warm greenhouse treatment, but, when in flower, may be moved to a cooler house. The pale, purplish flowers are freely produced from the axils of the leaves. Although really a hardy plant, the pretty little *Primula Forbesii* does better treated as a cool greenhouse plant. When a number of plants are grown together in shallow pans the effect is very pleasing. The pale, lilac-coloured flowers are freely produced

THE ROSARY.

CULTURAL NOTES FOR SEPTEMBER.

ALL budding, except on the *De la Grifferaie* stock, should now be finished. This stock is actively in growth much later in the season than others, and for that reason free-growing varieties of Tea and Noisette varieties of Roses can be inserted with every chance of success up to and not later than the middle of September.

Grafted Roses and those on their own roots that were plunged out-of-doors will, providing their shoots have been judiciously stopped, be showing plenty of flower-buds. A succession of blooms can be maintained from these plants till late autumn, provided that at the end of the month a portion of the batch is covered temporarily with movable glass frames, but not at the sides or the ends. The buds after September is passed will open better, and the petals will be cleaner if this glass protection be afforded. Most of the Tea and China Roses are now more pleasing and brilliant than at any other time. Shoots that have started into growth on the early-budded plants can now be shortened back to within three or four eyes.

A portion of the stock of forced Roses in pots, that have been plunged outside since the spring, can now be potted or top-dressed according to the condition of the roots. Those that were re-potted last year will generally require to be top-dressed only, and have the drainage corrected. Take out to the depth of 2 or 3 inches the old surface soil and replace it with some good loam. If the pots are filled with roots, place the plant into a larger receptacle, but if they have made little or no new roots return them to pots of the same size, using clean pots and fresh soil. In all cases pot firmly, and use a blunt stick for ramming when potting in 6 and 7-inch pots. An early batch of plants can be put in hand during the month, but the bulk of the potting should remain until well into October. When, as is usual, turfy loam or turves have been stacked for several months with layers of manure between them, little more will be required than the addition of some sharp sand or grit, and, for Tea and Noisette varieties, a small quantity of leaf-mould. If these materials are not available, the best use must be made of all those that can be obtained, but loam must be had in some form, and if new, it should have incorporated with it some rotten manure and road grit. It will be necessary to expose these materials to the air for at least a month before potting is commenced at the end of September.

Roses planted out under glass and intended for early flowering should be given a thorough soaking of water at their roots, and have their branches cleaned with a good insecticide that must be well sprayed on to the shoots by means of a garden engine or syringe. Allow a maximum amount of ventilation in the structure both by night and by day.

THE PLANTING OF ROSES.

It will soon be time to consider the planting of Rose trees. If a nursery can be visited, it is a valuable guide in selecting newer varieties and the best of the older kinds, and advice can be solicited on points such as the best varieties for town planting, or for special soils. The smoke-laden atmosphere near towns with smuts and soot stop up the pores of the leaves: plants near towns are also the more susceptible to the attacks of green fly and mildew. The best remedy in these conditions is to daily cleanse the foliage with a solution of soft soap applied with the garden syringe, or tobacco and quassia extract in hot water: for mildew add 3 ounces to 1 gallon of "sulphurivum," well stir and apply to both sides of the foliage, but wash off the fungicide later with clean water. An application twice a week will generally suffice to cleanse the plants,

but if very badly infested the application should be repeated oftener and at an increased strength. The soil near towns soon loses its good qualities, and for this reason requires to be frequently renewed. The old soil should be occasionally cleared out and fresh maiden-loam and manure substituted.

Climbers and bush varieties of Roses thrive the best near towns. Standards are as a rule very short-lived.

VARIETIES FOR URBAN DISTRICTS.

For town planting a selection of clean, healthy plants should be obtained from the country in October. Some varieties and classes of Roses succeed better than others near towns, notably the evergreen climbing and pillar Roses, which are all suitable for furnishing walls, arches, &c. Next in value are the hybrid China, hybrid Bourbon, the old Provence Cabbage, the old pink, white, and crested Moss, and many of the more hardy and freer-flowering hybrid perpetual varieties. The above selection

FIG. 66.—ARISTEA (WITSENIA) CORYMBOSA
FLOWERING IN THE OPEN IN DEVON.

will also be found to suit smoky districts. Some of the kinds I have mentioned are rather scarce, being out of date and difficult to procure. I recollect a collection of them growing in my father's nursery many years ago; some were trained as festoons on pillars and arches, and others as dwarf, ground plants, and for wealth of colour and abundance of bloom they were then without rivals. Amongst the best of the hybrid China and Bourbon Roses are *Blairii* No. 2, *Coupe de Hebé*, *Chas. Lawson*, *Paul Ricaut*, *Chénédoie*, *Mme. Plantier*, *Sir Joseph Paxton*, and *Eugène de Beauharnais*. The list of hybrid perpetuals includes *Duke of Edinburgh*, *Mrs. J. Laing*, *General Jacqueminot*, *Boule de Nègre*, *John Hopper*, *Anna Alexiff* and *Ulrich Brunner*. Lastly, although in order of precedence they should have been named first, are the varieties of climbing and pillar Roses *Amadis*, *Thoresbyana*, *Dundee Rambler*, *Fellernberg*, *Félicité-Perpetué*, *Mme. d'Arblay*, *Queen of Belgians*, *Aimée Vibert*, and *Williams' Evergreen*. J.D.G.

WITSENIA CORYMBOSA IN THE OPEN.

THIS pretty plant, which has an affinity to the Iris, was introduced into this country from South Africa rather more than a hundred years ago. At the time when New Holland, hard-wooded plants were largely grown, this Cape species was fairly common in greenhouses, but at the present day is extremely rare in cultivation, being almost unprocurable in the trade. Under glass, in the old days, it generally flowered late in the autumn, its gentian-blue coloured flowers making a pretty contrast to the Chrysanthemums then in bloom. The species is very distinct in habit, the stem being erect and of a firm, woody texture, while the sword-shaped leaves are arranged in a fan-like manner at the ends of the branches. The branching racemes of star-like, deep-blue flowers, almost an inch across, protrude beyond the tips of the leaves, and are freely borne. This *Witsenia* is now considered to be an *Aristea*, but it is far superior to *A. Eckloni*, which is also grown in the open in this garden, its flowers being much larger and remaining open the whole day, whereas those of this *Aristea* close at about two o'clock. Having seen specimens in the open in two gardens in the south-west, which were, however, not in the best of health, I determined to try it out-of-doors, and, after much trouble, procured a plant. This has now been in the open for two years, in front of a south wall, and, protected by a few evergreen branches, came through the past severe winter unharmed. It is now rather more than 2 feet in height, and very healthy. Curiously enough, this plant flowers in the open in the month of August, whereas in greenhouses it is generally in bloom in November. It is growing in sandy peat, and appreciates ample moisture during the summer months. The plant is a slow grower. It may be propagated by removing the leaf-fans at the base of the stem, each with a little of the old wood adhering to it, and placing these around the edge of a pot in very sandy peat, surfacing the soil with a layer of sand, and watering well. The cuttings must, as soon as potted, be covered with a bell-glass and be kept close until rooted, when a little heat will induce quicker growth. S. W. Fitzherbert, South Devon.

TRENCHING.

THE importance of the proper preparation of land before any plants are placed in it cannot be over-estimated, for upon the thoroughness with which this work is performed will largely depend the future well-being of the plants. The cost of properly digging and preparing an acre of ground is certainly a considerable item in a new garden, but if the latter is expected to furnish the best results, this initial expense must be incurred. The actual cost of trenching an acre of land varies according to the nature of the soil and the sub-soil, but to break this area of ground to a depth of from 2½ feet to 3 feet may be roughly estimated at from £20 to £35. If manure is incorporated, the cost will be considerably higher, say from £10 to £20 an acre more, according to the nearness and cheapness with which the dung can be obtained.

In commencing to trench a piece of ground, a line should first be stretched down the centre to divide it into two equal parts. A shallow furrow should be next made along the line with a spade. The first trench, to a width of 3 feet, should then be made on one half of the ground to be trenched, and the soil excavated be wheeled on to the corresponding part of the other half. The last trench on the first half is filled by the soil from the first opening on the other half, and so on until the last trench of all is filled by the soil wheeled out at the commencement. If the ground is of such a shape that it is not possible to divide it into two comparatively

equal parts, then the soil from the first trench must be taken to the opposite end to fill up the last trench, and in this case a cart will be found useful, as there are many cartloads of soil in a seemingly short trench.

The depth to which the ground should be broken depends entirely upon the nature of the sub-soil, but a depth of $2\frac{1}{2}$ feet should be the minimum. As a rule, 3 feet will not be too deep. It is unwise, however, to bring up too much inert soil to the surface, and if it is of such a nature that it is not advisable to bring it to the top, it should be thoroughly broken with a fork as deeply as is possible. The top spit of most soil is usually fairly suitable for plant-life, for though it may be greasy or choked

as much as possible, and, after the loose soil has been shovelled out of the bottom of the trench, the ground beneath should be broken as deeply as possible with a fork. If the ground is waterlogged, though not sufficiently so as to render draining necessary, it is advisable to place a layer of 6 inches or more of long straw from the stable yard, heather, bracken, or something of a like nature in the bottom of the trench. These substances will act for a year or two as a kind of drainage material, and by the time they have become rotten the broken ground above will be sufficiently weathered and porous to admit of a free evaporation of moisture. In the case of light, gravelly soils there are often too many stones present. When such is the

Freshly-trenched ground should be allowed a certain time to settle—preferably a year—before being permanently planted, but that need not prevent it producing a temporary crop. Potatoes form one of the best first crops on trenched ground, as they are not affected by the gradual sinking of the soil to its proper level, and chiefly because the operations of hoeing, earthing-up, and final digging of the tubers keep the ground stirred and cause it to become sweetened. Oats, Rye, Mangolds, and Turnips can also be used, but Potatoes are to be preferred, for the reasons stated above, while they also succeed particularly well on fresh ground.

Trenching should be contracted for by piece-work. Measurements vary in different districts; in some localities all ground work is done by the square of 10 yards, and in others by the square rod of $5\frac{1}{2}$ yards. The latter system prevails in this locality, and the cost of the work varies from 2s. 6d. to 4s. 9d. per rod, the latter for gravelly ground and including screening. If it is not possible to see every trench properly turned over, an iron bar about half an inch in diameter should be used for testing each trench. The depth at which the digging was agreed upon should be marked on the rod, and if it cannot be pushed down to that depth fairly easy, it shows that the work has not been thoroughly done. *J. Clark, Bagshot, Surrey.*

MATRICARIA INODORA "BRIDAL ROBE."

This improved variety of the native scentless Matricary received an Award of Merit from the Floral Committee of the Royal Horticultural Society, on August 6 last, when it was shown by Messrs. Titt and Son, Windsor. The variety should prove an acquisition amongst hardy garden subjects, for the type plant is one of the freest flowering "weeds," and is found in flower almost all through the season, from spring to autumn. The flowers of the variety "Bridal Robe" are white, and have the appearance of white blooms of *Pyrethrum roseum*. Each flower measures $2\frac{1}{4}$ inches in diameter.

FRUIT REGISTER.

SOME LATE-RIPENING PEACHES.

THE Peach crops in 1905-6 were, in many parts of the country, very unsatisfactory, but this season the results have compensated for those two bad years, as the crop is an excellent one in every respect. The following remarks refer to the outdoor crops of this fruit. Even in parts of the south-west, and in other favoured localities, the soil is not, in every district, suitable for the Peach, and in such instances I would advise the use of Peach cases or unheated houses. I have seen in some gardens in the south of England Peach trees so badly blistered that the trees on open walls never gave any return! The soil was an almost pure clay, and it was always waterlogged, but if the trees had been grown in unheated houses, splendid results would have followed. The glass structure is not only valuable for the Peaches, but it can be used for six months in the year to protect other crops. Many years ago I had a house of this description under my charge in the Midland counties, and it was one of the most useful structures in the garden. By its aid we were enabled to grow winter salads, and the house was equally useful for protecting many tender plants in the early spring.

Varieties of Peaches suitable for culture in unheated houses are by no means limited in number. Recently I saw the new variety *Peregrine* planted in a cool house, and though the fruits were not ripe, as it is a midsummer variety, I was impressed with its value for cool-house culture. Another lesser known but admirable kind for culture under glass is *Thomas Rivers*. The fruits ripen late in September, and it is one of the most valuable of all Peaches. The fruits are large, solid, and of excellent flavour. *Belle Beaux* is a variety that is not so well known as its merits deserve. A tree trained on a back wall in a cool house was one of the most profitable items in a garden once under my charge, as it never failed to produce a heavy crop of large

FIG. 67.—MATRICARIA INODORA "BRIDAL ROBE": FLOWERS WHITE.

with weeds, it has been more or less exposed to the beneficial influences of sun, rain, and frost. Should it be desired to retain this top-spit at the surface, it should be thrown on to the top of the preceding one. By turning it upside down, and shovelling any fine loose soil from the trench on to the top of it, the weeds, &c., will be buried to a depth of about 1 foot, sufficiently deep to destroy them. These remarks do not apply to couch, or twitch grass, which should be forked out and burned, although it may be killed if buried 3 feet deep. Having disposed of the surface soil, the next question is to deal with the ground beneath it, and the handling of this will depend upon its composition. If it is heavy, clayey ground, it should simply be turned over and broken up

case, the best plan is to use a coarse screen, and to separate the largest of the gravel, which can always be sold at a fair price if it is not needed in the garden. Care must be taken not to remove all the stones, as a certain proportion of these will help to keep the soil porous, and they will also assist in conserving moisture in the ground in dry weather.

If manure is to be worked in when trenching, it is advisable to put a fairly thick layer of it under the top-spit, so that it will be about one foot below the surface. For certain plants, especially Roses, it is advisable to work in another layer at a depth of about 2 feet, but for general purposes the upper layer will be sufficient, as more manure can be added later near the surface.

and good fruits. Exquisite, though a yellow-fleshed variety, is a splendid late September Peach; another variety not unlike it and excellent for cool-house culture is Thames Bank. This Peach is now rarely seen, but it is one of the best, and produces fruits of large size and good flavour. Of kinds better known may be mentioned French Galande, a splendid melting, richly-flavoured fruit, in season in September. It is often known as Bellegarde or Noir de Montreuil. Royal George may be considered one of the best varieties, and to the list may be added Dymond, Crimson Galande, and Lady Palmerston: the last-named variety has fruits of large size and with pale yellow flesh.

To obtain the best results in the open, the soil must be rich in quality and suitably drained. The Peach will succeed in gravelly soils, but in hot, dry situations on the gravel the foliage quickly becomes infested with red spider. The most suitable rooting medium is a good, rich loam. The old fruiting wood should be removed after the fruits are harvested, for this enables the trees the better to mature next season's fruiting wood. The trees should never be crowded with shoots, and, if possible, the manner of training should follow the extension principle, by which system the trees will furnish a wide area of wall space in a few years.

One of my favourite late Peaches for outside wall culture is Sea Eagle, a seedling from Early Silver, having a rich, vinous flavour. The fruits ripen at the end of September, and they are of very large size and highly coloured. The Nectarine Peach is also a late September variety. This is one of the best late-fruiting kinds, having a smooth Nectarine-like skin. The flesh is rich and melting, and though I found this variety to be a little less prolific in fruiting than Sea Eagle, it is an excellent Peach when grown in a well-drained or warm soil. Gladstone should also be given a trial, being a large, late-ripening Peach. Thomas Rivers, that was advised for glass culture, does well on a south-west wall, and it is especially suitable for culture in the southern counties. The well-known variety Royal George is a little earlier in ripening than most of those I have described as suitable for open walls: its free-bearing qualities and habit of growth makes it a favourite for any position. Much the same remarks apply to Stirling Castle and the large fruiting but excellent variety Noblesse. These are all suitable for the hardy fruit garden. *G. Wythes.*

APPLE MILDEW.

In the college plantations here the Apple Mildew (*Podosphaera leucotricha* [Ellis & Everh.] Salm.*) has lately begun to attack the fruit. In some cases the delicate, white spawn (mycelium) of this mildew has spread over the greater part of the Apple, covering it with a very fine, thin, whitish layer, looking somewhat like "bloom." In other cases the Apple is attacked on one side only (usually the side nearest to the leaves), or frequently only in the immediate neighbourhood of the stalk. No deformity, or, indeed, injury, has up to the present been observed in the affected Apples, although, where the mildew has almost completely enveloped the Apple, it is probable that the ripening will be interfered with. In the present case it appears that the mildew has only lately appeared on the Apples, having spread from the leaves to the fruit when the latter was full grown. In all the cases observed the leaves also of the tree were affected with mildew. The varieties which I have found with mildewed Apples are the following:—Irish Peach, Lane's Prince Albert, and Sandringham.

On carefully inspecting mildewed Apples of the varieties Irish Peach and Sandringham, I

found, in a number of cases, the ripe fruit-conceptacles (perithecia) of the fungus. These conceptacles, containing the winter-spores (ascospores), occurred in scattered groups on the mycelium on the surface of the Apple. In many cases the parasitic fungus *Ampelomyces quisqualis* had attacked the mildew, and formed its own fructifications on the Apple by the side of the perithecia of the *Podosphaera*. It may be noted that *Ampelomyces* during the present season has been remarkably prevalent on Apple leaves attacked by the mildew.

I should be glad to learn from growers if the fruit of Apples is being attacked generally by the mildew. Mr. F. Smith, of Loddington, near Maidstone, tells me that, some years ago, he noticed the mildew on the fruit of some of his Apples, but has not observed it since. It is possible that it is only in such damp summers as the present that the mildew is able to spread from the leaves on to the fruit. It is of some interest to ascertain what varieties are liable to be attacked as regards their fruit, and I should be glad to receive examples of mildewed Apples of other varieties than those named above for examination and experimental purposes. *E. S. Salmon, F.L.S., Mycologist to the South-Eastern Agricultural College, Wye, Kent.*

The Week's Work.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq., Norwood, Alloa, Clackmannanshire.

Grape vines.—The varieties Lady Downes, Lady Hutte, Directeur Tisserand, Gros Guillaume, Black Alicante, &c., being well advanced in colouring, if not already coloured, will require a free circulation of air in the structures both by day and night. Maintain a little heat in the water pipes almost continually to expel the atmospheric moisture in the houses, and particularly during cold, wet weather. Cover the outside borders with frame sashes to protect them from rains. Varieties not colouring satisfactorily should be kept as dry as possible at the roots, and be prevented, if possible, from making a second growth. Rub out any young growths as soon as they appear. Test the borders regularly with the soil tester, which will satisfy the cultivator at once whether the borders are dry or not.

Figs.—Trees growing in pots or borders and that have been cleared of their first crop of fruit will need a good supply of water at the roots. Liquid manure may be afforded at every alternate watering. Apply a mulch of horse manure. If large fruits are desired, the crop must be well thinned. Syringe the trees frequently to keep the foliage clean and free from red spider. Tie in young shoots. Cut out suckers and any gross wood, thus exposing the foliage to plenty of light. Figs in pots which were forced early, and the fruit gathered, should be placed out-of-doors to mature their wood. Plunge the pots almost to the rims in coal ashes in a warm, sheltered position, but one exposed to the full rays of the sun. Repot any plants requiring more rooting space. Be careful, however, not to put them into pots which are of larger sizes than necessary, as Fig trees fruit best when the roots are confined in a moderately small space. The compost should consist of three parts good turfy loam and one part lime rubble, with a 6-inch pot of chemical manure added to each barrow-load of the compost.

Melons.—Plants growing in frames heated by hot-beds require to be most carefully watered, as the fruits are now netting, and if an excess of water be applied at this stage, the plants will collapse. If the bottom-heat is deficient, apply a fresh lining of short grass and horse manure. These materials are best prepared by making a good heap of them to ferment, mixing and turning the heap until the excessive heat has escaped. Afterwards make up a good lining all around the frame, first removing the old manure from the frame. Admit rather more air to the frames as soon as the fruits commence to colour.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Calanthes.—The earlier flowering varieties of the deciduous *Calanthes* as *C. Veitchii*, *C. bella*, *C. Victoria Regina*, *C. Burfordiensis*, *C. Harrisii*, *C. Sedenii*, *C. Bryan*, *C. amabilis*, &c., having now filled their pots with roots will require copious waterings whenever the compost becomes dry, but during dull weather water must be afforded with the greatest discretion, or the new leaves and pseudo-bulbs that are now forming will become spotted and diseased. Plants that are thoroughly well rooted may be supplied with alternate waterings with weak liquid cow-manure. It is important at this period to expose these plants to all the sunlight possible without the leaves being scorched; also to admit plenty of fresh air. The plants should be elevated well up to the roof glass, and so arranged that each will obtain its full share of sunlight. At Burford the glass immediately over these plants was stippled over when they were re-potted; this stippling has now become almost transparent, and thus affords just sufficient light to invigorate and solidify the bulbs. Under these favourable conditions the plants dry very quickly, and require almost unlimited supplies of moisture. Where the lath blinds or the ordinary canvas shading is used, the amount of shade afforded by them should be gradually lessened each day, so that in a few weeks, when the plants have become accustomed to the extra light, these shadings may be safely dispensed with.

Chysis.—The different varieties of *Chysis*, as *C. bractescens*, *C. aurea*, *C. Sedenii*, *C. Chelsoii*, *C. Limminghei*, and *C. laevis*, which are still growing, may be arranged alongside the *Calanthes*, and should be afforded the same kind of treatment until growth is complete, when they may be returned to the *Cattleya*-house to rest.

Epidendrums.—Such species as *E. prismatocarpum*, *E. auriculigerum*, *E. radiatum*, *E. cochleatum*, *E. contusum*, *E. inversum*, *E. variegatum*, *E. fragrans*, *E. pentotis*, *E. glumaceum*, *E. lanipes*, and others of this section, are now commencing to grow afresh, and any that stand in need of re-potting may be given attention. The pots should be made about one-half full of drainage materials, using a compost consisting of two parts of rough fibrous peat to one of sphagnum-moss. Make the compost moderately firm about the roots and keep the base of each plant on a level with the rim of the pot. Place them in a light and moist position in the intermediate house, and afford water very carefully until roots become plentiful, neither letting them become very dry nor too moist.

Cool House.—*Lycaste Skinneri*, *Odontoglossum Insleyi*, and *O. grande* are in full growth; therefore they will require copious waterings until the bulbs are fully made up. Examine the young growths occasionally, and see that no water remains in them, as this would cause them to decay.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Liliums.—A good rule to observe in respect to the garden species and varieties is to let well alone. Established clumps which flower well, and produce healthy foliage, should not be disturbed, but if a good top-dressing of rotten manure be afforded them at any time during the next three months it will be beneficial. Those clumps which show signs of partial exhaustion by producing smaller flowers and thin foliage (which is apt to die away before the flowering is completed) should now be lifted, sorted, and planted afresh in thoroughly well-prepared soil. Most *Liliums* revel in a deep, moist, rich soil; the North American species usually require the addition of peat, and *Liliums candidum*, *chalcidonicum*, and *umbellatum* succeed well in lighter soils. *L. candidum* and *L. Martagon* should be planted shallowly, just covering the bulbs with soil, so that they may have plenty of warmth from the sun. *L. chalcidonicum* and its varieties should be planted more deeply. It is only in the more favoured gardens that such gorgeous *Liliums* as *L. auratum* and *L. speciosum* are hardy enough to stand

* The Apple Mildew is sometimes erroneously called *Sphaerotheca Mali*. As I have pointed out in my *Monograph of the Frysphaeaceae*, p. 41, the use of this name is clearly wrong.

the winters out-of-doors and flower well in the following summers. In order to cultivate these varieties well, the bulbs should be potted as soon after they are received as possible. Put them into frames for the winter season, and plant them in their positions in the garden late in the following spring. Fresh manure afforded at the time of planting is fatal to the well-being of nearly all Liliiums. Shelter from rough winds is necessary.

Penstemons.—Cuttings should now be taken of the best varieties. Where they are grown in large numbers it is usual to devote a frame for their reception; for smaller quantities the cuttings may be inserted in pots or boxes and placed under a handlight, keeping the atmosphere of the frame close until the cuttings have made roots, when air should be gradually admitted to harden the young plants.

Perennial Phloxes produce much finer trusses, and the flowers last longer, when young plants are put out each year, especially if the plants are grown in light soils. Cuttings firmly inserted in sandy soil, and treated as advised for Penstemons, will make roots readily at this season of the year.

Half-hardy shrubs have a better chance of passing safely through the average winter if the growths are well ripened, and to attain this end it is necessary to cut away sufficient shoots to allow the remaining branches plenty of room for the free circulation of air. Any side-shoots made after this date should be pinched out.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

Coleworts.—Make good any failures that have occurred in former plantings, and continue to make fresh plantations, for although Coleworts are not particularly hardy, if the autumn is a favourable one they will make useful produce before there are any severe frosts.

Cabbage.—Where an early sowing was made, the plants will now be large enough for planting out. These will be followed in due course by plants forming the main crop, for although it is satisfactory to have an early batch, it is not advisable that a great quantity should be so forward. The earliest plants are not so likely to stand well through the winter, and usually they are the first to "bolt" into seed.

Winter vegetables.—The number of plants of all kinds of winter vegetables that have gone blind this season has been exceptionally large. If any may still be found in the quarters, they should be at once removed and their places filled with fresh plants from the seed beds, or, better still, from later sowings that were made principally for this purpose, a system which has much to commend it where it can conveniently be carried out.

Lettuce.—Continue to put out plants from previous sowings of hardy varieties of both the Cos and Cabbage types, whichever is in most demand, choosing warm, sunny positions. During the early part of September fill any cold frames which may be available, with such Lettuces. From sowings made at the present time, and at fortnightly intervals in September, under handlights, of the French variety *Petite Noire* a supply of tender Lettuces may be obtained from November all through the winter and early spring. "All the Year Round" I consider a splendid variety, but for this particular season I do not think the *Petite Noire* is equalled. The ground for growing these winter Lettuces must be liberally enriched with good, short, thoroughly-decayed manure, and a sprinkling of soot. A very little air may be admitted to the young plants during the hottest days of autumn, but afterwards the cloches or frames must be kept quite close, never on any account admitting air. This variety will only excel under these conditions. Although grown extensively for supplying the Paris markets, it appears but little cultivated in this country, and I am convinced it would be a boon to many if it were better known, thriving, as it does, at the very worst season of the year.

Endive.—Plants raised from the earliest sowings will now be in course of blanching. Continue to put out plants from the later sowings in light, rich ground. If the plants are arranged

in beds, the process of blanching is easily carried out. When growth is finished, either one bed or a part of one bed, according to the demand, can be covered over with wooden shutters or anything conveniently to hand that will entirely exclude the light. Such a covering will at the same time generally prove sufficient protection from the weather.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq.,
Eastwell Park, Kent.

Forcing bulbous plants.—If a supply of bulbous flowers is required before Christmas, there should be no delay in potting the bulbs if this is not already done. Bulbs should be allowed to develop their roots before they are subjected to hard forcing. *Hyacinthus orientalis*, the white Roman Hyacinth, is one of the earliest subjects to flower; next follow the *Polyanthus* and the *Single Trumpet Major Narcissi*, also *Duc van Thol Tulips* in various colours, with others that will submit to early forcing, such as *Cottage Maid*, *Belle Alliance*, *La Reine*, and *Vermilion Brilliant*. The bulbs of all these should be potted in a compost consisting of equal parts loam and leaf-soil, with plenty of sand added. After potting, place the plants on ashes in the open, and cover them with leaf-soil, but when growth commences this should be removed.

Retarded plants.—These are useful for furnishing a supply of flowers in mid-winter. *Lily of the Valley* is one of the commonest plants whose season of flowering is retarded by means of a cold atmosphere. The crowns can now be purchased cheaply, and they should be ordered to be delivered at intervals of two or three weeks, so as to ensure a succession of flowers. Retarded plants of *Astilbe* (*Spiraea*) can also be purchased at a reasonable price, and a few of these should be started into growth at intervals throughout the winter. Some of the newer *Astilbes*, with pink flowers, are valuable acquisitions.

Salvias.—*S. azurea grandiflora* (syn. *S. Pitcheri*) is a very beautiful plant when in flower, and is valuable in gardens where blue flowers are in request. The plant is of graceful habit, and is one of the earliest of the shrubby species to flower, for its blossoms are developed early in autumn. If the plants are growing in a bed or border, lift and pot them as soon as the flower-spikes are seen. *Salvia splendens*, variety *grandiflora*, is a great improvement on the type, the flower-spikes being larger, the inflorescences more brilliant, and the plant of a compact habit. A batch of this plant should be grown for furnishing the greenhouse or conservatory before the *Chrysanthemums* come into bloom. The cut flowers are suitable for table decoration. Other species of *Salvias* which flower later in the season are *S. coccinea*, *S. involucrata* var. *Bethelii*, *S. rutilans*, and *S. gesneriflora*. All these are useful for the furnishing of large conservatories or corridors.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton,
East Devon.

Apples.—Early varieties that ripen during the latter part of August and early in September will not keep in good condition long after they are gathered; the fruits are best when eaten within a day or two, as they so quickly deteriorate in flavour. Among cooking varieties now in season, few can equal *Ecklinville Seedling* and *Lord Suffield*, closely followed by *Potts' Seedling* and *Duchess of Oldenburgh*. Not one of these will keep good for long, so should be turned to good account at once. Good prices should be secured for any which are to be sold, for Apples are far from being a heavy crop.

Pears.—Daily attention should be given to the few varieties that ripen at this season, such as *Jargonelle*, *Beurré de l'Assomption*, *Beurré Giffard*, *Williams' Bon Chrétien* and *Clapps' Favourite*. Allow the fruits to become fairly ripe before gathering them, so that they may be eaten almost direct from the tree when their full flavour will be appreciated. With so little sun, it is feared that flavour will be poor in most fruits. Now that the small and bush fruit have been mostly gathered, Pear trees against walls should be netted to prevent the tom-tits

pecking the fruits. Isolated specimens can be tied up in small bags of hexagon, or small pieces of fish netting and tied in at the stem of the fruit.

Nuts.—Filberts and Cobs promise good crops, whilst Walnuts are very scarce. Cut out any sucker-growths from the base of Filbert bushes, and see that squirrels do not take the fruits, the gun being the best means of scaring them, if not allowed to kill. Caterpillars have not ribboned the foliage this year as in some seasons, owing to our having sprayed the trees early in spring after the fruit trees were finished.

Apricots.—Keep the secondary shoots pinched back to the first leaf, and shorten any robust shoots on young trees, in preference to pruning them in winter. As the trees become divested of the fruit, give them a good washing with either clear or soapy water. Examine the border, and if the roots are found to be dry, afford the border a heavy watering, replacing the mulch for a few weeks longer to retain the moisture in the soil. Loosen any tight ligatures on recently-budded stocks, and syringe them overhead in the evening. Such stocks growing in soils of a porous nature may be given a good root-watering.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Prosecutions.—Few duties are more unpleasant than the prosecution of visitors for the infringement of the park by-laws. As the chief official of the department is invariably held responsible for these matters, and has to decide what cases are to be proceeded against and which have to be dropped, he often finds himself in a very delicate position, in which much tact has to be exercised. In this, as in everything else where judgment has to be used, it is always best to decide each case upon its merits instead of making a hard and fast rule of treating all infringements of by-laws alike. Needless to say, class distinctions should never be taken into consideration in deciding these questions.

Minor and other offences.—There are many by-laws which are broken nearly every day of the week, but unless the same persons persisted in disregarding them, no official would ever think of taking proceedings against the offenders. Walking on the grass, jumping over seats, or taking dogs into parks without being on leash, are minor offences. But there are matters about which it is quite beyond the province of an official to use his own discretion, and such cases must go before the magistrates. Any infringement of by-laws having for their object the moral or physical protection of the public should never be condoned, and the culprit, whatever his or her station in life, should be proceeded against.

Stealing plants or flowers.—When it comes to picking flowers, stealing plants, or doing wilful damage, it is a case for the superintendent to take what steps he thinks best, so as to adequately punish the offenders and at the same time prevent others from following their example. In some parks every person caught picking a flower is prosecuted, while in others, beyond frightening the thieves, nothing further is done. For many years past we have adopted a method of dealing with flower stealers which has proved satisfactory. When the culprits are children they are taken to the office, where a lesson is read them, and a park constable in uniform is sent to inform their parents and warn them that if their children are ever caught stealing flowers again they will be prosecuted. When we have to deal with older persons, if they show signs of sorrow they are cautioned and let off, but if they are impertinent or show no regret for their action, they are summoned. During our experience we have never had the same persons accused twice of flower-stealing. We are not so lenient with plant stealers or with those who do wilful damage, but it greatly depends upon the value of the plants taken or the amount of damage done whether we institute proceedings or not.

Notice of prosecutions.—It is sometimes expedient to post up in prominent positions in the park notices of prosecutions which have taken place for the infringement of by-laws. This should be done as little as possible, and care should be taken never to publish the names of the offenders.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and fully signed by the sender. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR SEPTEMBER.

TUESDAY, SEPTEMBER 3—
Roy. Hort. Soc. Coms. meet.
Nat. Amateur Gard. Assoc. meet.

WEDNESDAY, SEPTEMBER 4—
Glasgow and West of Scotland Hort. Sh. (2 days).
Hemel Hempstead Fl. Sh.

THURSDAY, SEPTEMBER 5—
Nat. Dahlia Soc. Ex. at Crystal Palace (2 days).

SATURDAY, SEPTEMBER 7—
Pollockshaw Fl. Sh.
Soc. Franc. d'Hort. de Londres meet.
German Gard. Soc. meet.

TUESDAY, SEPTEMBER 10—
Scottish Hort. Assoc. meet.
Dahlia Sh. in Manchester Botanic Gardens (2 days).

WEDNESDAY, SEPTEMBER 11—
Roy. Caledonian Hort. Soc. Sh. at Edinburgh (2 days).

THURSDAY, SEPTEMBER 12—
London Dahlia Union's Sh. in Botanic Gdns., Regent's Park (2 days).

FRIDAY, SEPTEMBER 13—Hamilton Fl. Sh.

SATURDAY, SEPTEMBER 14—Newton Mearns Fl. Sh.

MONDAY, SEPTEMBER 16—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, SEPTEMBER 17—
Roy. Hort. Soc. Coms. meet.
Brit. Gard. Assoc. Ex. Council meet.

SATURDAY, SEPTEMBER 21—German Gard. Soc. meet.

TUESDAY, SEPTEMBER 24—
Nat. Rose Soc. Autumn Sh. at R.H.S. Hall, Westminster.

FRIDAY, SEPTEMBER 27—Roy. Botanic Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—59.4°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 28 (6 P.M.): Max. 75°; Min. 52°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 29 (10 A.M.): Bar. 29.9; Temp., 70°; Weather—Bright sunshine.

PROVINCES.—Wednesday, August 28 (6 P.M.): Max. 60°, Colchester; Min. 56°, Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Sale of Dutch and other Bulbs at Stevens' Rooms, King Street, Covent Garden, at 12.30.

MONDAY TO FRIDAY—
Dutch Bulbs in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

FRIDAY—
The whole of the Greenhouse Plants, Glass Erections and Sundries, at the Woodstock Nurseries, Golders Green, N.W., by Protheroe & Morris, at 12.

Grammatophyllum speciosum at Peradeniya.

We have received from Mr. Hugh A. MacMillan a photograph of a plant of this species in flower in the Royal Botanical Gardens, Peradeniya, Ceylon (see fig. 69), who describes the specimen as being at its best on July 17th last. So remarkable are the size and form attained by the leaves and inflorescence of *Grammatophyllum speciosum* under suitable conditions in the tropics, that all other Orchids appear but miniatures in comparison. The species is a native of some of the Malay Islands, and a plant was introduced to the gardens at Peradeniya about the year 1850. Like certain other introduced species of plants, it flourishes there to an extent seldom seen in its native habitat. This was not the case, however, until recently, for though the *Grammatophyllum* had apparently been grown there for about 40 years, it was

not until 1898 that, in consequence of a change in its treatment, it really began to assert its majestic habit. Up to that year it was tenderly nursed on an old, decaying tree stump under the partial shade of surrounding trees, thus imitating, it was thought, as far as practicable the conditions of its native habitat. The result of removing the plant from this tree to a sunny position, writes Mr. MacMillan, the curator of the gardens, and planting it in a mound of turf, decayed manure, charcoal, broken bricks and laterite stones, was that it soon commenced to grow rapidly, and about a year later threw up

FIG. 68.—AERIAL ROOTS OF GRAMMATOPHYLLUM SPECIOSUM WHICH ARE NOT PRODUCED FREELY AT PERADIENYA.

six flower spikes. It has since flowered more or less every alternate year, and in July last was bearing 26 magnificent inflorescences. It is obviously a great effort on the part of the plant to produce at one time so enormous a crop, and it is not surprising that the specimen does not repeat the process every year. From the first appearance of the spikes above ground to the visible setting of the first fruit occupies about four months, and two months more are required to ripen the stout pod-like fruits. The minute, brown seeds are produced in great quantity, but hitherto these have not found at Peradeniya conditions necessary to their germination, even though afforded artificial aid. Therefore the only means available for the propagation of the species is by division.

Though so shy in flowering, it is worthy of note that but few plants seem to grow so well under such varying conditions as the

"Giant Orchid." By nature it is chiefly epiphytal, and may be found growing upon trees, but at Kew it is treated as an aquatic, having been grown there for many years in the tank in the Victoria Regia House; whilst at Peradeniya it is most successfully grown as a terrestrial or ground-plant. At Peradeniya it has become so accustomed to the terrestrial treatment that it seems to have gradually lost the habit of producing the characteristic, upright, spiny roots, which are invariably present when the plant is growing under the conditions of an epiphyte. It has been supposed that these peculiar roots (see fig. 68) are associated, under normal conditions, with the absorption of water and nutriment from decaying vegetable matter. At Peradeniya they have hitherto been produced chiefly in the dry season.

Grammatophyllum speciosum is a species that, for obvious reasons, is seldom found in Orchid collections which have to be cultivated in glasshouses in temperate climates. There are, however, a few cases on record of the plant having flowered in English hot-houses. In October, 1859, a writer in these pages recorded a plant then in flower at "Nonsuch House," in Surrey, and he for some reason referred to it as the "Letter Plant." The plant now cultivated at Kew, and which was presented by Messrs. Sander & Sons, made a poor effort to blossom in 1901, and the specimen is developing inflorescences at the present time. The species has also flowered in Sir Trevor Lawrence's collection at Burford (see fig. in *Gardeners' Chronicle*, August 4, 1906, p. 86). As regards the flowering of this species in the tropics, Mr. Curtis, late of the Botanic Gardens, Penang, described a plant in bloom there in 1903 as having 24 flower-spikes.

The specimen recently in flower at Peradeniya, and which it is believed has not yet attained to its maximum size or vigour, is apparently the finest yet recorded. It bore 26 stout, erect racemes, and these varied from 5½ to about 8½ feet in height, each having over 100 flowers. Thus the plant carried nearly 3,000 single flowers, which are sweet-scented and borne mostly towards the tops of the racemes. They measured individually 5½ to 6 inches across. The ground colour is of a yellow tint, profusely spotted and blotched with purple or chocolate, the pedicels being greenish-white. The Peradeniya plant is furnished with about 70 stems or pseudo-bulbs, these varying in length from 5 to 10 feet, and bearing a hundred or more ribbon-like leaves, which are 20 to 30 inches long.

We have reproduced an illustration of a single flower at fig. 70.

The foliage to be seen in the background of fig. 69 is chiefly that of *Monstera deliciosa*, the "Giant Creeper" of Mexico, as it is sometimes called.

OUR SUPPLEMENTARY ILLUSTRATION.—The illustration which forms the supplement to our present issue shows a view in the Fernery at Shipley Hall, Derbyshire, the residence of E. MILLER MUNDY, Esq. (gr. Mr. J. C. TALLACK). The photograph could only take in the back and central portion of the house, and an *Adiantum* clothed rockery at the front of the house is, therefore, not visible. Sufficient is shown, however, to give a good idea of the interior of the house. The rock-

Photograph by W. J. Vasey.

VIEW OF AN ENCLOSED GARDEN AT HAMPTON COURT PALACE.

work was built about 14 months ago, and was planted in the month of May last year. Most of the plants have succeeded well, and the Ferns, *Begonia Rex* in variety, *Periplocas*, and a few other species afford a very good effect, the *Begonias* showing especially well when illuminated with electric lamps placed behind the plants. This Fernery forms a continuation from the Water-lily house, illustrated in our issue for August 17, and which is itself entered from the long corridor attached to the residence.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of the Royal Horticultural Society will be held on Tuesday, September 3, in the Society's hall, Vincent Square, Westminster. At the afternoon meeting of Fellows, at 3 o'clock,

Elgin, where a great quantity of young trees of numerous species, of which the Scots Fir and the Larch predominate, are grown. At the Pinefield Nursery of this firm were seen 4,000,000 one-year-old plants of Scots Fir, 2,000,000 two-year-old trees of Scots Fir, 4,000,000 one-year-old specimens of Larch, and about 3,000,000 other seedling forest trees. Large numbers of young forest trees were also seen at five other nurseries belonging to Mr. WISEMAN.

MR. W. H. YOUNG, who for 17 years was Orchid grower to the late Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, has purchased the nursery and seed business carried on at the Mercury Nursery, Romford, Essex. Mr. YOUNG is a member of the Orchid Committee of the Royal

"the weather" has such a far-reaching influence upon the well-being or otherwise of the plants under their charge, and although no word is as frequently on their lips, yet how few gardeners appear to have even an elementary idea as to how weather changes in this and other countries are brought about. It may be they see no use in acquiring the necessary knowledge, considering how helpless even the best informed must always feel in regard to such changes—whether favourable or unfavourable. Or, may not this indifference rather arise from the science of meteorology being so seldom treated in such a clear and interesting manner as to enable those having no previous acquaintance with the subject to know, for instance, where our rainfall comes from, why the barometer is so often misleading when regarded simply as a "weather

FIG. 69.—GRAMMATOPHYLLUM SPECIOSUM IN THE PERADENIYA BOTANICAL GARDENS. THE PLANT PRODUCED 26 RACIMES, EACH BEARING UPWARDS OF 100 FLOWERS. (See page 168 and fig. 70.)

a lecture on "Lesser Known Orchids," illustrated by lantern slides, will be given by Mr. F. W. MOORE, Glasnevin.

PRESENTATION.—Mr. A. C. SMITH was presented on the 21st inst., by the employees on the Lydhurst Estate, with a marble timepiece on his leaving to take up his new duties as Assistant Superintendent of the Royal Horticultural Society's gardens at Wisley.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY.—The annual excursion of this society took place recently, Elgin being selected as the headquarters for the visit. On Wednesday, August 8, the estates of Orton and of the Duke of RICHMOND and GORDON at Fochabers were inspected, and visits were paid to Mr. EDWARD WISEMAN's extensive nurseries in the vicinity of

Horticultural Society, and for several years he has written the yearly calendar in these pages under the heading "The Orchid Houses." Our readers will join us in wishing Mr. YOUNG every success in his new departure.

CARNATION ANDREW CARNEGIE.—It is stated in *The American Florist* that a fine new Carnation, to which the above name has been given, appeared as a sport with the Chicago Carnation Company of Joliet, Illinois, and also with Mr. J. P. SNOW, Sharon, Massachusetts. It is said to be in habit identical with the parent Harlowarden, but the colour is scarlet.

"WEATHER."—This is a little pamphlet written by the Hon. H. A. STANHOPE, and published by the Agricultural and Horticultural Association, Ltd., London, at the price of one penny. Although

glass," why the winds in the British Isles are so variable in strength and direction, and other similar questions of considerable interest to all those engaged in horticultural pursuits. This little pamphlet is therefore to be welcomed, as the author in the small compass of 20 pages manages to deal successively with the subjects of temperature, clouds, atmospheric pressure, rain, thunderstorms, wind, and forecasts in such an interesting way, and by means of such simple language, that all his explanations can be readily understood by the ordinary reader; while those who will take the trouble to study it carefully will be able to gather helpful information as to some of the laws which govern the apparently hopeless irregularities in the movements of our atmosphere. The illustrations scattered through its pages will also prove of service.

NATIONAL DAHLIA SOCIETY.—The annual show of the National Dahlia Society, to be held on September 5 at the Crystal Palace, is expected to be very successful. Mr. H. L. BROUSSON, honorary secretary to the Society, writes us to the effect that the Dahlias promise to be of unusually good quality, owing to the frequent rains and warm nights.

AN ORCHID AUCTION AT SCHONBRUNN.—

As a consequence of the overcrowding of the Orchid houses in the Imperial Gardens at this palace of the Austrian Emperor, 2,000 plants, as in the previous year, have been offered for sale recently. The plants were put in small lots and included some that were raised in the Schönbrunn Gardens. One of these novelties carries the name *Cattleya Schönbrunnensis*, and is the result of a cross between *C. Bowringiana* × *C. maxima floribunda*. The blooms are said to be of a larger size, darker in colour, and the lip more beautifully marked than those of the parents. Cut blooms of choice *Cattleyas*, *Dendrobiums*, and *Cœlogynes* were likewise sold by auction. Such sales will be held annually at Schönbrunn.

THE STRAWBERRY CROP IN GERMANY IN 1907.—

Herrn L. MAURER, a well-known cultivator of small fruits at Jena, states, in the *Deutsche Gärtner-Zeitung*, that, owing to frosts in the spring, many of his Strawberry plants lost their leaves, and crown buds, even such varieties as have been hitherto regarded as immune from loss by frost, namely, the Alpine varieties. Some of those which suffered worst are varieties of French origin, as *Belle de Meaux*, *President Meurin*, and even the old *Gloire d'Orleans* have not bloomed at all. Herrn MAURER mentions varieties which the older generation of gardeners were well acquainted with, but which have dropped out of general cultivation in these islands, viz., *Bearn's Mammoth*, *Sabreur*, *Victory of Bath*, *Teutonia*, *Dr. Neubert*, *Globe*, *Duke of Edinburgh*, *Duc de Magenta*, *Helvetia*, *Belle de Bourg*, *La Reine*, &c. The varieties *St. Joseph* and *Antoine de Padoue*, and the Chilean Strawberry, *Wilmot's Superb*, lost a high percentage of plants. On the contrary, *La Reine*, *Reine des Precoces*, and *Napoleon III.* suffered but few losses. A further remarkable experience was noted in a number of popular English-raised varieties, as *Lord Suffield*, *Lord Napier*, *Guntton Park*, *Stevens' Wonder*, *British Queen*, *Jubilee*, *Monarch*, *The Countess*, and *Laxton's No. 1* were frozen out, to a great extent, in the previous winter. His observations of English varieties proved that many have not become acclimatised. German and French varieties succeed better under similar conditions. Of English varieties that are hardy and fruit freely are *Dr. Hogg*, *Fillbasket*, and *James Veitch*. *Laxton's Noble* withstood 22° Reaumur, but the beds of all of these must be renewed every third or fourth year at the farthest. This notwithstanding these varieties are reckoned among the best that he cultivates. The three hardiest and most suitable Strawberries for that part of Germany are *Jucunda*, *Sharpless* and *Ker's Prolific*. These grow vigorously and withstand frost, even in heavy, wet land. Others that come next in point of hardiness and fruitfulness are *Kaiser's Samling* (Seedling), *Noble*, *Deutsch-Evern*, *König Albert von Sachsen*, and *Comet*.

DEATHS IN FRANCE.—In the obituary columns of the French horticultural journals we note the death of M. GEORG BUCHIER, proprietor of one of the largest firms in Paris. He was chiefly concerned with the distribution of novelties in plants. M. POUBELLE, a former Ambassador, and the first President of the French Dendrological Society, died in Paris recently at the age of 63 years.

ROOT ACTION AND BACTERIA.—In our issue for August 10 we reproduced a letter, printed in *Nature*, from Mr. F. FLETCHER. The following reply by Mr. SPENCER PICKERING in the same journal is interesting:—The experiments mentioned by Mr. F. FLETCHER in *Nature* of July 18 (p. 270) bear only on the functioning of roots once they have come into activity, not on their

been previously treated in various ways; the water-contents of the medium were the same in every case, and re-inoculation from the air was prevented. All the experiments were made in duplicate, and all the duplicates were remarkably concordant. The results were that seeds in unheated earth began to germinate on the ninth day, the total germination being 65 per

FIG. 70. *GLADIOLUS SPECIOSUS* TO SHOW SINGLE FLOWER: COLOUR, YELLOW SPOTTED WITH PURPLE OR CHOCOLATE. (See page 168.)

passage from the dormant to the active condition. The probable analogy between the bursting of a dormant root-bud and the germination of a seed has led me to investigate the latter, and some of the results already obtained tally exactly with those obtained with trees. Seeds of *Lolium perenne* sterilised by carbon disulphide, were planted in soil or sand which had

cent.; in earth heated to 250°, 150°, 95°, and 80°, no germination has occurred yet, although 22 days have now elapsed, while in the case of earth heated to only 60°, germination did not occur until the eighteenth day, and the total germination is only 30 per cent. Dr. RUSSELL mentions that in his experiments he had not noticed any retardation to be produced by the sterilisa-

tion of the soil; but in his experiments, as well as in my own Apple trees, no steps were taken to guard against re-inoculation from the air, and such re-inoculation would be very easy in the case of seeds just below the surface of the soil. Another explanation may be that we have not used similar seeds; and from some experiments with mustard, now in progress, it is evident that different seeds behave differently, though the difference may be due to the imperfect sterilisation of the seeds themselves in some cases. Dr. RUSSELL has been good enough to examine my experiments whilst in progress, and I believe that he is satisfied with the results so far as they go at present. There is not sufficient evidence yet to show whether the bacterial action is a direct one on the seeds, or whether it is an indirect one, as Dr. RUSSELL suggested, modifying some chemical change produced in the soil by heating. The very low temperature (60°) which suffices to affect the germination tells against the view that chemical change is one of the governing factors, as also does the fact that the results obtained with sand are similar to those obtained with earth. On the other hand, it was found that with soil which had been heated to 150°, and then re-inoculated, germination was much retarded, and was very feeble, this pointing to some chemical change which was not counteracted at once by the re-inoculation. The view that plants in growing charge the soil with something which is toxic to other plants was put forward a year or two ago by Dr. WHITNEY, but the evidence adduced for it seems to have been very inconclusive; the details of Mr. FLETCHER's results in this direction will, therefore, be expected with considerable interest. We have, during the last three years, been endeavouring to ascertain whether any action of this sort can account for the effect of Grass on trees, trees having been grown in earth or sand in pots and watered with leachings from earth or sand in which Grass was growing. The results, however, have been entirely negative.

A NURSERYMAN'S VISIT TO CANADA.—Mr. JOSEPH CHEAL, a member of the firm of Messrs. J. CHEAL & SONS, nurserymen, Crawley, has recently returned from a visit to this important colony. In the course of his journey he visited the Okanagan Valley, where the large fruit estate started by Lord ABERDEEN about 14 years ago is situated. The fruit-growing industry in British Columbia bids fair to become an important one. The Okanagan estate is now managed by a company (the Coldstream Estates, Limited), and they are fast developing their 13,000 acres, clearing the land, dividing it into farms, erecting buildings, and planting the ground with fruit trees. It is a lovely valley; the greatest drawback seems to be the drought of summer, and irrigation is necessary to bring the fruit to perfection. A great irrigation scheme is in preparation for supplying the whole district. The older plantations of Apples at the time of Mr. CHEAL's visit were carrying splendid crops, which were being severely thinned. Mr. CHEAL regards the prospects in British Columbia for fruit growing as being very favourable. The climate is greatly tempered by the nearness of the Pacific Ocean and also the sheltering mountains, but the district does not experience anything like the extremes of temperature that are found further inland, for Peaches and Grapes grow even in the open air. The fruit industry is evidently only in its infancy in this colony, but there is an enormous demand for produce over the great prairies and growing cities of the Central Provinces, where it is practically impossible to grow fruit. Vancouver, Mr. CHEAL describes as a city of delightful situation, nestling amongst hills and forests round a magnificent harbour with rocky promontories. One of these, 960 acres in

extent, is reserved for a public park, and contains many noble specimens of the original forest trees. The largest of these, *Thuya Lobbii*, has a hollow trunk with irregular, warty sides that measured 57 feet round, whilst another beautiful symmetrical specimen measured 42 feet in circumference at 4 feet from the ground and towered up to probably 200 feet in height.

A GARDENERS' UNION FOR LOWER AUSTRIA.—The gardeners of Lower Austria have founded an association and will establish a number of branches in other places. At the inaugural meeting, which was numerous attended, many questions of importance to nurserymen and florists came up for discussion. The conditions of the trade-gardener, the pressing necessity for the introduction of a certificate of efficiency in this business; accident and sick clubs, railway charges as affecting the trade, and other matters were discussed.

THE ASSISTANT DIRECTORSHIP AT KEW.—We have pleasure in reproducing a portrait of Mr. ARTHUR WILLIAM HILL, M.A., who has recently taken up the duties of Assistant Director in the Royal Gardens, Kew. Mr. HILL spent several years as senior Demonstrator in Botany, and has

MR. ARTHUR WILLIAM HILL, M.A.

been lecturer in Botany at Cambridge University since 1905. He was elected Dean of King's College last year. He has written many botanical papers in scientific journals, and in 1903 he travelled in the Andes of Bolivia and Peru. Since the appointment of Sir DANIEL MORRIS as Director of the Imperial Department of Agriculture for the West Indies, the post of Assistant Director at Kew has remained unfilled, although it is common knowledge that the duties involved in the Directorship have pressed with increasing severity. Our best wishes go to Mr. HILL in his new and important appointment.

SAMUEL HENSHAW.—This widely-known and successful landscape gardener in the U.S.A., died on July 23, at the age of 63 years, in West New Brighton, Staten Island, New York.

Publications Received.—*Orchidee di Seme*, by Chas. Sprenger, being an extract from the *Bulletin* of the R. Società Toscana di Orticultura.—*The Botanical Magazine* (Tokyo).—*Bulletin* of the Imperial Botanic Garden, St. Petersburg. Vol. VII., pt. I.—*Guide to Experiments conducted at Burgoyne's (University) Farm, Impington*, and at other centres in the Eastern Counties (1906-1907). Issued by the Cambridge University Agricultural Department.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 84-90.)

5.—SOUTHERN COUNTIES.

(Continued from page 146.)

SURREY.—The promise for good crops of all kinds of fruits was excellent, but cold nights have greatly thinned the fruits. Our soil is of a light sandy nature. *S. T. Wright, Wisley Gardens, Ripley.*

—Apples and Cherries are average crops in this district. Pears are not plentiful, but Plums are above the average in quantity; in fact, the trees are breaking with the weight of the fruits. Small fruit are about an average; Strawberries have been very good. *Geo. Jackman & Son, Woking Nurseries.*

—Of Apples, Warner's King is the only variety that is heavily fruited. All varieties of Pears are bearing a sufficient, but not an enormous, crop. Such heavy crops of Plums were never before seen in this district, and the fruits hang thicker than the leaves. Every tree requires at least half its fruits thinned. Strawberries were spoilt by the 12° of frost on May 20. *Rev. W. Wilks, Shirley Vicarage, Croydon.*

—In spite of the dull, cold, windy weather of spring-time, the fruits crops, with the exception of Apples, are very good in this district. Apples appear to have suffered severely from the unseasonable weather and from blight; the trees in some cases are presenting a half-dead appearance, and although spraying was carried out last winter, the trees have never before appeared so bad. *W. H. Honess, Cobham Park Gardens.*

—Differences of soil seem to make very little distinctions as to the extent of the fruit crops. Some kinds of fruits are good on all soils this season, whilst others are rather thin. Apples, whilst plentiful on some trees, are very few on many others, due, without doubt, to the frequent low temperatures and cold rains at the time the blossoms were expanded. The earlier blossoms on wall trees, also on Cherries, Plums and Pears seem to have suffered less—a fact of material importance when so much is being expressed in favour of later-blooming fruit trees to escape spring frosts. Bush fruits are abundant, and probably they were never better. That Black Currants have been so plentiful and fine serves to show that the ravages of the Currant mite are very far from being universal. *Alex. Dean, Kingston-on-Thames.*

—The fruit crops in this locality are above the average in quantity. All kinds of Apple trees are carrying large crops. Pears are somewhat fewer, but the fruits, being evenly distributed over the trees, promise to finish well. Plums are much too thick, and we have pulled off quite half the fruits. Cherries, both dessert and Morello, are a heavy crop. Peaches and Nectarines are an average quantity, and these fruits promise to mature well. Apricot trees set an enormous crop, necessitating much thinning of the fruits. Small fruits are very abundant. Strawberries are a light crop, and about ten days later than usual in ripening. The varieties Laxton's Latest and Bedford Champion require special mention. Nuts are plentiful. Walnuts are certainly later than usual. The soil here is a light, gravelly loam, and to keep the crops growing satisfactorily much rain is needed. *George Kent, Norbury Park Gardens, Dorking.*

SUSSEX.—Apples are very much under the average in quantity; varieties such as Irish Peach and Claygate Pearmain, that fruit at the ends of the previous year's growths, have the heaviest crops. The excessive rainfall caused many Strawberries to decay before they were ripe; slugs also spoilt many of these fruits. *Alex. Reid, Possingworth Gardens, Cross-in-Hand.*

—The fruit crops generally in this district are very good, with the exception of Apples, which are indifferent. The Apple trees are badly infested with blight, and this caused many of the fruits to fall. All other fruits are plentiful; the late-fruited varieties of Strawberries gave very good crops. The soil here is stony, and rests on the sandstone formation. Potatoes appear to be good: I have observed a little blight on the early varieties, but others are excellent. *W. Brunson, Brambletye Gardens, East Grinstead.*

— Considering the untoward season, the fruit crops are satisfactory. Strawberries suffered from the excessive wet and cold weather, and many of the first blooms were spoilt by frost. Raspberries, Gooseberries, Currants, Plums and Pears are plentiful and of excellent quality. A few trees of Bramley's Seedling, Dutch Mignonne and Lord Suffield Apples have very heavy crops, but, generally, Apples are scarce. We still have a few of last season's Apples. Our soil is a heavy loam on a stiff clay. *W. J. Langridge, Ote Hall Gardens, Burgess Hill.*

— Apple trees are more injured by fungus diseases and aphides than ever before in my experience. Most varieties of Plum trees have full crops, but many of the fruits are dropping off. Gooseberries are very abundant, and red and white Currants are above and black Currants about an average in quantity. Strawberries on light soils were practically a failure. Almost all vegetation is more or less unhealthy, as the result of the cold and wet season. The foliage on Currant and Apple trees has withered prematurely to a great extent. *W. E. Bear, Hailsham.*

— All fruit trees here are carrying average crops, whilst Plum trees are heavily laden with fruits. The earliest and best fruits of the Strawberries were spoilt by frost on May 18. Blight early attacked Apple trees; cold winds prevailed throughout June, and the south-west winds caused much damage to all trees, especially tall standards. The soil here is a stiff, heavy loam on a sub-soil of marl, clay, and sandstone. *A. B. Wadds, Paddockhurst Gardens, Worth.*

— The fruit crops upon the whole are satisfactory. Pears are a fine crop, and the foliage of these trees is fairly clean. But this cannot be said of Apple trees. Some varieties of Apples are laden with fruits, and many have been removed. Apples will be of bad quality, owing to an attack of aphids. Cherries generally are plentiful, but tender varieties are scarce, owing to excessively cold weather during the stoning period. Bush fruits, also Peaches, and Nectarines are all good crops. Raspberries are an excellent crop and of high quality. Strawberries have been good. Plums are an average in quality. Our soil is of a heavy nature, with a clay sub-soil. *W. A. Cook, Leonardslee Gardens, Horsham.*

— These gardens are situated about 100 feet above the sea level and in a valley, where the effects of late spring frosts are badly felt. Strawberries and other tender fruits suffer considerably from this cause. From May 18 to 20 the frost was very severe, and affected both Apples and Strawberries considerably. All kinds of small fruits are plentiful and of good quality, Raspberries in particular. Nuts are an average crop, and appear to be swelling well. Cherries have suffered much through the cold weather in June, and many of them failed to develop their stones, and on that account are falling off badly. We have not had such a heavy crop of Plums for several years, and trees of many varieties are overlaid. Apples, with the exception of a few early varieties such as Irish Peach, Ecklinville Seedling, The Queen, &c., may be considered a failure. Pears of most kinds are an average crop, and appear to be swelling well. Our soil is a cold, retentive one, and is not suited for the cultivation of Pears, though in dry seasons they succeed fairly well. *H. C. Princep, Buxted Park Gardens, Uckfield.*

(To be continued.)

LAW NOTE.

BANKRUPTCY.

In a comparative table issued by the Inspector General in Bankruptcy showing the total failures under Bankruptcy and Deeds of Arrangements among gardeners, florists and nurserymen, we find that in 1902 there were 40 failures with liabilities amounting to £63,273; in 1903 there were 49 failures with liabilities amounting to £33,603; in 1904 there were 49 failures with liabilities amounting to £29,104; in 1905 there were 31 failures with liabilities amounting to £27,065; in 1906 there were 32 failures with liabilities amounting to £62,343.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

ASTILBE DAVIDII.—Mr. Tallack's experience does not correspond with mine in regard to this plant. I think he must have a bad strain, such as may happen easily with a plant that seeds so abundantly as this species. I noticed the disagreeable change of colour of the fading flowers in some plants at Kew; but here, where the atmosphere is more humid and the soil cooler, that change for the worse does not take place, and I consider the plant one of the most valuable of those recently introduced. It does not require swampy ground, as Mr. Tallack suggests, but it grows vigorously in the ordinary border, if peat and sand are added when it is planted. If Mr. Tallack would like a few seedling plants, I can send him a few, or seed, if he prefers it. *Herbert Maxwell, Monreith.*

THE OLD CLOVE CARNATION.—Can any reader tell me whether there is in commerce a true pink-flowered form or sport of the old crimson Clove Carnation? I know there is a white one, although I have forgotten the name by which it is known. I ask because a railway employee here in Kingston has quite a large stock he has worked from a branch sport of a fine pink-flowered variety, the colour being a true pink, but deeper than is that of the well-known tree Carnation Enchantress. It is strange that, after cultivation in gardens for generations, a sport of this kind should arise in this man's garden. Both the old crimson Clove and the pink one are very robust and in perfect health. The sport greatly resembles the pink sport seen now somewhat plentifully from the old double crimson Pæony, and of this there is, though yet rare, a white-flowered sport also. *A. Dean.*

THE SOWING OF CYCLAMEN SEED.—I have sown seeds of Cyclamen for the past nine years by the first week in August. I find the best method is to use pans and to dibble the seeds in by the finger to a depth of a quarter of an inch, and at a distance of three-quarters of an inch between each seed. The seeds are germinated in a temperature of from 60° to 65°, and the soil in the pans is kept in a moistened condition. This is a better plan than placing them in a cold frame to germinate. After the seedlings appear they are still allowed this high temperature. I find the seedlings do not require to be transplanted when the seeds are sown in the manner I have described. The first potting should be done in February, and small pots should be used. The next shift should be given when the tiny pots are filled with roots, which should be about the middle of May, and they should still be kept actively growing in a warm atmosphere. As the season advances and the weather becomes more genial, the plants should be placed in a frame containing water pipes, so that a little warmth may be afforded should the weather turn cold. The final potting should be done in July or not later than early in August, but I prefer the July potting. Pots having a diameter of 6 inches will be of an ample size for their flowering. By this system of culture the plants will flower from the end of September until after Christmas. Some persons keep their plants of Cyclamen somewhat dry at the roots, but this is a mistake, for their large fleshy corms require plenty of moisture during their season of growth. A suitable soil for Cyclamen consists of good fibrous loam, some leaf-mould, lime rubble, dry sheep manure rubbed through a half-inch sieve, and a sprinkling of bone-meal. Do not have too rich a compost, as this will favour too much leaf growth. The secret to success in the culture of seedling Cyclamen is to grow them without a check from the start to the finish. *W. Fulford, Castle Eden Gardens, Co. Durham.*

NOTOSPARTIUM CARMICHAELIÆ.—This fine shrub is hardy in several parts of Scotland, and it soon assumes a large size. The finest specimen I have seen in Scotland is in the garden of Mr. W. D. Robinson-Douglas, Orchardton, Kirkcudbrightshire. This is growing in the rock-garden, where it has been for a number of years, without suffering much from the severe winters experienced since it was planted. It flowers freely, and is a beautiful shrub when in bloom, as is shown by your excellent illustration on page 146. *S. Arnott, Dumfries.*

DEFOLIATING TOMATO PLANTS.—This is not so generally practised as it was a few years ago, and those persons who still continue to remove the foliage in a ruthless manner cannot understand much about the functions of the leaf. The practice has probably resulted from a common error in obtaining too gross a growth in the plants, the result of either a free use of organic manures or an excess of moisture at the roots of the plants. Over-crowding at planting time has also necessitated the removal of many of the leaves subsequently in order to admit the necessary light and air. I have seen Tomato plants 4 feet or 5 feet in height stripped of two-thirds of their leaves at a single trimming. The removal of the leaves in this manner causes a severe check to the plant, and the harm can be seen at a glance by cutting open a few of the fruits, which are found to be poor in colour, hollow, and light in weight. Every cottager knows the ill-effects of frosts upon the Potato, and that when the foliage is badly injured the crop suffers accordingly. A frequent excuse for defoliating the Tomato is that it "assists the fruits to colour more quickly." When the plants are well cultivated, the proper development of the fruits follows as a matter of course, and in such circumstances the removal of a leaf-lobe in places does no appreciable harm. The greater mischief is done when the plant is divested of much of its leafage while the fruits are in an early state of development. *E. H. Jenkins, Hampton Hill.*

NEW ATTRACTIONS AT SHREWSBURY SHOW.

—Your suggestion as to the desirability of providing some fresh feature at this great show should command consideration. The introduction of a champion prize for collections of vegetables this year had a wonderful effect in stimulating public curiosity, as also great interest amongst professional gardeners. Throughout the first day no tent was so densely thronged as was the vegetable tent, everybody being anxious to see the winning exhibit. It is easy to understand how difficult it is to provide many absolute novelties in competitive classes. The grand decorative groups staged seem to have reached perfection in displaying the exhibitor's decorative art, as well as that of the plant cultivator. Yet even these have now reached a stage of comparative yearly reproduction in style and in beauty, and a new and novel method would be welcomed. I am not sure whether a class for groups of certain dimensions of literally any description of plants, the primary consideration being entire novelty in arrangement associated with beauty, would not prove to be a powerful attraction, could competitors only be induced boldly to break away from what is getting to be stereotyped styles and plants. The distinctly beautiful, as well as novel, arrangement set up by Mr. Amos Perry indicates something of the direction in which competitors might go. You mention a desire to see some change in the dessert tables. With respect to the fruit, there is naturally some variation in the arrangements and kinds each year on each table, but a change is needed in the flower decorations, and those in most cases seemed to be too dominating, too heavy, though built up of light flowers. There is more desire to decorate a table than to allow for conversation between the guests sitting at the table. Possibly, limiting the heights of the flowers to 12 inches—the judges being requested to make awards to them for lightness and beauty obtained from the simplest material and the smallest quantity—would put competitors on their mettle to produce something that would have the charm of novelty. Should a new challenge vase be provided for a champion Grape class, the vase should be made rather more difficult to win than it has been hitherto, and to that end I would suggest that no award be made of the vase except at least six of the bunches shown secure maximum points. That would prevent so great a prize ever going to an inferior collection. Mr. Shingler has done wonders to maintain a high standard of excellence, but even he secured but three maximums, and Mr. Mitchell, who came second, had but two maximums. In his table of points, the maximum of points capable of being obtained by Gros Maroc is put as 11 instead of nine. Only perfect examples should be regarded as worthy of such a splendid vase, but the cash prizes should be awarded in any case. *D.*

THE HORTUS DUROVERNI.—I have had a copy of a *Hortus* in my possession for some years past. It bears the name given above, and the title-page states that it is "a tabular and descriptive catalogue of perennial flower-roots, hardy trees and shrubs, greenhouse and hothouse plants, fruit trees, kitchen-garden and flower seeds, &c., cultivated and sold by W. Masters, Nursery and Seedsman, St. Peter's Street, Canterbury." The copy in my collection is the third edition, published in 1831 by Longman, Rees, Orme, Brown and Green, London, and comprises 130 pages of small type, bound in marbled covers of the size $4\frac{1}{2}$ inches wide by $6\frac{1}{2}$ inches long. The author was the father of the late Dr. Masters, a Fellow of the Horticultural Society and Curator of the Canterbury Museum, which latter institution he was the means of founding, and in the preface he "congratulates those friends who, fully entering into his wishes, promptly assisted in the undertaking, on the success that has attended their efforts; for already in nearly every department of natural history are there specimens to guide and illustrate the researches of the naturalist." To aid in completing this museum, Mr. Masters formed an herbarium of specimens from his nursery, which were duly arranged in their natural orders and named for reference. It seems scarcely possible that three-quarters of a century have elapsed since the publication of this work when we read the introduction, which might well have been written for a modern book. The author remarks: "The study of natural history has, of late years, assumed a rank and importance which, from its scope and tendency, it ought ever to have held; for can we conceive an education more eminently defective than that which does not include a knowledge of those objects in the animal and vegetable world by which we are surrounded, and of which we are essentially a part in the great chain of animated beings?" It is quite refreshing to read such thoughtful words in a catalogue of plants, for there is an unfortunate tendency to lose sight of the principles which should underlie the true pleasures of horticulture. The *Hortus Duroverni* contains a most remarkable list of plants, and as the considerable area of 30 acres was devoted to them, it can be imagined what an interesting collection had been formed. The total number of genera enumerated is 736, and the number of species and varieties must exceed 10,000. In the first division, viz., that devoted to hardy perennials and bulbs, 299 genera are included, and some of these comprise surprising collections of varieties, for instance, of *Ranunculus asiaticus*, which was at that time one of the popular flowers; no fewer than 226 forms are named and the colours stated. But the most astonishing of all are the Tulips, of which the collection was a particularly rich one, comprising 219 Bizarres, 188 Roses, 254 Byblœmens, 25 doubles, and 40 early varieties, or a total of 726. Dahlias came next in point of numbers with 159, which are grouped under singles (20), doubles (114), Irish Globe and Anemone flowered (25). Of double Anemone coronaria no fewer than 100 varieties are named, a large proportion being of French origin, judging from the names. Under Dianthus, besides several species, 50 varieties of garden Pinks are given, 67 varieties of Carnations, and 19 of Picotees. Amongst the former is one bearing the enticing title of "Strawberries and Cream." Hyacinths are classed as double rose or pink, double yellow, double blue, double white, and singles, the total being 78 varieties. Of *Chrysanthemum sinense* 36 varieties are named, which included most of the best of those then known. At the present time many nurserymen would be well satisfied if they could confine their collections to the number stated above. Hardy trees and shrubs representing 173 genera formed another section of the *Hortus*, and the collection appears to have been a fine one for that period, being especially rich in deciduous trees. Elms received a good deal of attention from Mr. Masters, and he raised several seedlings from *Ulmus campestris*, which were fully described by Loudon. One of these, *U. campestris*, var. *viminalis*, is represented in many gardens at the present time by fine specimens. Of *Cratægus* 24 species and varieties were included; of *Ilex*, 22; *Pyrus*, 18; *Quercus*, 18; *Rhododendron*, 28; *Azalea*, 56; *Fraxinus*, 18; and *Salix*, 41. Roses are placed in this list, 15 species and 284 varieties being named. It is interesting to note

that of *Pinus* only seven forms are listed, and of *Abies* five. Greenhouse and hothouse plants comprise 386 genera, but only in a few instances are the numbers of species and varieties large. Thus, of *Camellia* 55 forms are named, mostly varieties of *C. japonica*; of *Erica* 88 species and varieties are given; of *Mesembryanthemum* 35; and in all these cases it would be difficult to find a British nursery at the present time with anything like these numbers. Twenty-five species of *Pelargonium* are mentioned, while the varieties reach a total of 175. Amongst Orchids only two species are named, viz., *Bletia Tankervilleæ* and *Cymbidium ensifolium*, while the *Palms* are restricted to three—*Chamaetrops humilis*, *Phoenix dactylifera*, and *Rhapis flabelliformis*. Hardy fruits received a good deal of attention at Canterbury, and the collection was a thoroughly representative one. Apples, for instance, comprised 200 varieties, Pears 128, Gooseberries 62, Plums 42, Cherries 28, Peaches 26, Nectarines 19, Strawberries 26, Apricots 11, and Grapes 38. Under the list of *Pinus* is a note to this effect: "We observe in most gardens the Orleans, on account of the abundance of its produce, superseding much finer and more desirable kinds, such as Coe's Golden Drop, Guimaraen, La Délicieuse, &c." The second of these I have failed to identify, the last is known as Cooper's Large, and the French name has been corrupted in some districts to "Lady Lucy." Guimaraen is described as yellowish-green, long, of medium size, of rich, sugary flavour, and ripe in August and September. Is it known in any of the Kentish gardens or nurseries now? It should be added that the whole of the botanical names of plants are accented, the translation of the name is given in most cases, together with the native country, natural order, colour of the flowers, height, and time of flowering, while in the fruits the shape, colour, quality, and season are indicated. It makes one wish that modern catalogues could be issued in a similar form. R. Lewis Castle. [This little book is rarely met with now; the copy I purchased in the old Holywell Street, Strand, about 1890, was the only one I ever saw on sale, though I was then familiar with it, as the work was included in Dr. Robert Hogg's library at the Journal of Horticulture Office. When I sent the MS. (now printed) to the late Dr. M. T. Masters, he acknowledged it in these words: "Many thanks, I was born in that *Hortus*." The last communication I had from him referred to these notes, and requested he might be allowed to retain the MS. "a little longer." R. L. C.]

VERBENA MONTANA.—This plant is a hardy floriferous species, with pale pink blooms from the Rocky Mountains, and it was brought to this country in 1873. This journal, in noting the introduction of this species, stated (1873, p. 575), "Crosses made between this new species and *V. venosa* would in all probability produce an interesting progeny, and if it were also used by raisers of seedling Verbenas, for the purpose of restoring something of the lost constitution which has resulted from inter-breeding, the Verbenas might eventually become more popular, or at least better fitted for outdoor purposes in our gardens." The *Verbena* has, in fact, become more popular as an outdoor and pot plant since that date, but I am not aware of any recent raiser who has followed the advice then given. The Verbenas of the present day are even more beautiful, and quite as floriferous as any that existed in the 50's and 60's. I would ask what has become of *Verbena tenera* var. *Mahoneti*, a very dwarf plant, with pretty striped flowers. If it exists, it might be used with some taller-growing modern varieties for the production of fancy-coloured plants for basket work and filling small beds, similarly to the brilliant scarlet-flowered *V. melindres*, which, it is to be feared, is lost to gardens. F. M.

RONDELETIA STRIGOSA.—A specimen of this uncommon species of *Rondeletia*, growing in a suspended basket in the intermediate portion of the "T" range at Kew, well shows its suitability for this mode of treatment. It forms a freely-branched little bush, whose slender arching shoots are clothed with neat foliage of a deep shining green, while the flowers, which very much suggest those of a *Bouvardia*, are bright crimson with a yellow centre, and about one-third of an inch in diameter across the expanded mouth. They are borne in neat,

rounded, terminal clusters. *R. strigosa* cannot be obtained from the nurseries, but when introduced from Guatemala under the name of *Bouvardia Roezli* it was grown in Messrs. Henderson's nursery at St. John's Wood, and one hybrid at least between this species and a garden form of *Bouvardia* was put into commerce. The name of this particular variety was "Unique," the flowers being violet-carmine with a white tube. I have not seen it for some years, and in all probability it has now dropped out of cultivation. As such a cross has been effected, this species suggests various possibilities to the hybridist. W.

FLOWERING WALL-PLANTS FOR NORWAY.

A lady who has a house in Norway on a small fjord running out of the Sogne Fjord, would like to plant some flowering creepers on the sunny side of her house, facing to the south. On that side of the house facing to the fjord, which has a N.E. aspect, she has Hops and Virginian Creepers. Annuals are not satisfactory there, as the snow lies so late, and the summer is too short for them to make growth and flower. Her Sweet Peas this year, on August 15, were not one foot above the ground. The Norwegian spring and summer are very brief, but for a short period the sun's rays are very powerful, and the duration of sunlight longer than ours in England. Our common wild flowers grow plentifully in that district, and both Harebells (*Campanula*) and wild "dog" Roses are much deeper in colour and larger in size than any I have seen in England. Hemp Nettle (*Cannabis*), Yarrow (*Achillea*), Asphodel (*Asphodelus*), St. John's Wort (*Hypericum*), Meadowsweet (*Spiræa*), Grass of Parnassus (*Parnassia*), Kingcups (*Ranunculus*), Sundew (*Drosera*), Butterwort (*Pinguicula*), all flourish, and this year we found *Linnea borealis*. Two glaciers come down into two valleys at the head of the fjord some six miles inland, but the aspect intended for the creepers is away from the glacier breezes. L. J. F.

QUESTION NIGHT.—I was much interested in the note in last week's issue, p. 152, by A. D., upon the above subject, wherein it is proposed to set apart one night during the winter session as "Question Night," at the Kingston Gardeners' Mutual Improvement Society's meetings. The Birmingham and Midland Counties Gardeners' Mutual Improvement Society introduced such an evening three years ago, and one member presented the society with a polished mahogany question box—having a fair-sized slit in the top. This box is placed in a convenient position every evening, to enable members to put a written question in at any time. On the night set apart for the purpose, the box is unlocked by the chairman, who reads each slip out separately and invites any member to reply—it generally falls to one of the officers to start the ball rolling, when discussion soon follows from various members. Each question is dealt with separately and an excellent evening is the result. W. Spinks, *The Nurseries, Solihull*.

THE POISONOUS PROPERTIES OF PRIMULA OBCONICA.—It might interest some readers to know that during the present season we have had very unpleasant experiences of the effects of the leaves of *Primula obconica* upon the skin of those persons who have had reason to handle them. Early in spring my foreman suffered greatly for many days, and was unable to sleep through the irritating effects caused by handling several plants at the potting bench; in his case the arms between the wrist and elbow were badly swollen, and of a crimson colour. Some nine or ten days ago, and following the clearing of some 30 to 40 plants from the conservatory, one of my journeymen came to me in a terrible state, his hands and wrists, and the greater part of his face had broken out in sores (each sore appeared as if a water cell), and he had suffered extreme nasal catarrh for 24 hours. I at once sent him to a doctor, who pronounced him badly poisoned, and now, a week later, he is still incapacitated. Our stock of this *Primula* has been consigned to the fire heap. Geo. Burnes, *Shandish Gardens, Elm Hill, Hemsted*.

TRADE NOTICE.

Mr. J. H. TAYLOR will manage the Nurseries, Bexley Heath, Kent, for Mr. G. S. EVANS, as formerly for Mr. A. F. DUTTON.

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

AUGUST 20.—*Present*: E. A. Bowles, M.A., F.L.S., F.Z.S. (in the chair); Dr. M. C. Cooke; Messrs. J. T. Bennett-Poe, H. T. Güssow, E. M. Holmes, G. Gordon, and F. J. Chittenden (hon. sec.).

Tomato disease caused by Septoria lycopersici.—Mr. Gussow showed specimens of Tomato leaves from Gloucestershire having brown spots. These quickly cover the whole leaf, which dies in the course of a very few days after the infection commences. The disease does not seem to have been recorded in this country hitherto, although it was found in Argentine as long ago as 1881. There seems no remedy after the plants are once attacked, since the progress of the trouble is so rapid, but plants attacked should be burned immediately.

Neobenthamia gracilis, Rolfe (see fig. 72).—A spike of this very pretty Orchid from Zanzibar was shown by Mr. BENNETT-POE. It was awarded a botanical certificate in 1900, and is described by Mr. Rolfe in *Gardeners' Chronicle*, 1891 (ii. ns.), p. 272, and figured in *Bot. Mag.* (1900), t. 7221.

no doubt of its being Berkeley's species; it agrees so well with the description and the figure. The spores are so profuse that it would be dangerous as a pest were it to obtain a foothold."

Plum Anthracnose.—Dr. COOKE also said: "Some Plums have recently been submitted to me which were evidently suffering from the attacks of a new pest. The surface of the nearly-ripe fruit exhibited one or two concave depressions, about a quarter of an inch in diameter, and of a pale tan colour, contrasting strongly with the deep purple of the fruit. These depressions were lined with the minute receptacles of a species of Anthracnose, as the Americans term this form of disease, produced by species of the genus *Gloeosporium*. In this instance the spores were abundant in the depressions, hyaline, but comparatively very small for the genus, not more than 10 to 12mm. long, and about one-fourth as broad. Hitherto I have found no described species to correspond with the present, so that for the purpose of identification I have called it *Gloeosporium prunorum*." (See *Gardeners' Chronicle*, August 24, 1907, p. 160.) Dr. COOKE showed sketches and specimens of this disease.

Ceropegia hybrida.—Mr. E. A. BOWLES showed a flowering specimen of this hybrid, which was described and figured in the *Gardeners' Chronicle*

this was another case of graft hybridisation somewhat similar to that seen in *Cytisus Adami* and in *Cratægo-mespilus*.

Effect of lightning on Elm.—Mr. C. H. HOOPER sent specimens illustrating the effect of lightning on an Elm tree which had been struck during a storm on August 17. "The tree, which is about 100 yards from a tall church tower, was struck about 40 feet from the ground, and shows no damage till within 6 feet of the ground, where on one side the bark with the wood has been gouged out, and on the other side the bark only has been cut and stripped as if with a knife." The extent of the damage caused to trees in this manner seems to depend on the amount of water in the wood.

Effect of light on direction of growth.—Mr. SUTTON, through Mr. BENNETT-POE, called attention to a letter from Mr. J. B. WALLIS in the *Times*, who described a curious growth in an Elder in a thicket near Wirksworth, Derbyshire. He writes: "So great was the tangle of brushwood that the branches of this tree had been forced to bend over and grow towards the ground, after the manner of the Weeping Willow. To grow normally the leaves would have appeared with their under sides uppermost, but, to prevent this, the stalk had grown spirally, making a complete revolution of the axis, and thus bringing the leaf right way up, the whole presenting a peculiar appearance. Such is the power of sunlight and the faculty of adaptation to environment."

Twin Apples.—Mr. G. F. HOOPER, of Croft Fruit Farm, Pershore, sent an excellent specimen of this not very uncommon phenomenon. In the present instance the two fruits were on quite distinct stalks, and the fruits had become coherent in the upper parts.

ROYAL HORTICULTURAL OF
ABERDEEN.

AUGUST 22, 23, & 24.—This society held its annual show on the above dates in the Duthie Public Park, Aberdeen. The weather on the opening and second days was unfavourable, but on Saturday the weather was fine, and many persons attended.

There were upwards of 1,600 entries.

POT PLANTS.

In the class for a display of stove or greenhouse plants, arranged for effect, in spaces measuring 8 feet by 6 feet, Mr. GRIGOR, Fairfield Gardens, won the 1st prize. Mr. GRIGOR had also the best Ferns, his specimens of *Nephrolepis Whitmanii* and *Adiantum Farleyense* were exceptionally well grown.

Mr. GILLESPIE, Northfield Place, Aberdeen, showed the best Fuchsias. In a class for six plants suitable for the decoration of a dining table, and in pots not exceeding 6 inches in diameter, the exhibits shown by Mr. John Petrie, Gardener to Sir THOMAS BURNETT, Bart., of Leys, Crathes Castle, well deserved the 1st and 2nd prizes awarded to them. Mr. MACKIE, Morken, carried off the premier prize for Begonias with exceedingly fine plants.

Orchids were not numerous shown, but those exhibited by Mr. A. DUNCAN, Rubislaw Den House Gardens, Aberdeen, were of excellent quality, and deserved the 1st prize awarded them. Mr. A. Douglas, gardener to THOMAS OGILVIE, Esq., Kepplestone, Aberdeen, had finely-grown *Dracænas* and *Crotons*, which gained for him the 1st prize. *Gloxinias* made an exceedingly fine show, the specimens shown by Mr. ALEXANDER DUNCAN, Rubislaw Den House, were the best. *Petunias* were few in entries, but were decidedly good in quality. Mr. J. W. BRECHIN, Gardener, Ardoe, Belhelvie, Aberdeenshire, had the best of these plants.

CUT FLOWERS.

The marquee devoted to cut flowers proved a delightful attraction to the many visitors, the principal feature being the splendid display of Roses and Cactus Dahlias. Mr. ALEXANDER HARPER, Rubislaw Park Gardens, Aberdeen, and Mr. WILLIAM COUTTS, Ellon, Aberdeenshire, were successful in these classes. Mr. HARPER easily won the premier prize with capital specimens of Tea and Noisette Roses. Mr. ALEXANDER BREBNER, Dalhelvie Gardens, Aberdeenshire, exhibited Cactus Dahlias, which evoked general admiration, and worthily gained for him the premier place.

FIG. 72.—NEOBENTHAMIA GRACILIS, SHOWING HABIT AND FLORAL DETAILS.

Aphides on Palm roots.—Mr. GORDON showed portions of the root of *Kentia Forsteriana* upon which were large numbers of a species of woolly aphid. The plant from which the specimen had been taken did not appear to have suffered to any extent from the attacks of the insects. They were referred to Mr. SAUNDERS for further examination.

Reappearance of a Peach pest.—Dr. M. C. COOKE showed figures of a pest of Peaches, which "the late Rev. M. J. Berkeley recorded and figured in *Gardeners' Chronicle* for 1864, p. 938. This mould Berkeley discovered on ripe Peaches in Wales, where he found it to be a pest producing a great profusion of large spores. He named the fungus *Macrosporium rhabdiferum*, but, as the spores were not muriform, it could not be *macrosporium*. In the *Handbook*, I called it *Helminthosporium rhabdiferum*, but now that I have seen it I find it is not *Helminthosporium*. In the interim it appears not to have been met with anywhere, until last week it turned up on Peaches again—after everyone had given it up as a mystery, and it was excluded from all consideration as a pest. There can be

for December, 1906, p. 383. It was raised from seed of *C. Sandersonii*, which species had been crossed with pollen of *C. similis*. Mr. BOWLES also showed a flower of *C. Sandersonii* for comparison.

Fruit of Pyrus Malus floribunda.—Dr. BONAVIA sent some large fruits of this Japanese variety of Apple, which he had not before seen producing seed. Several members of the committee remarked on the large size of the fruit produced by this variety this year.

Variation in Beech foliage.—Mr. A. HOSKING sent specimens of the foliage of the fern-leaved Beech (*Fagus sylvatica asplenifolia*), and branches from near the top of the same tree bearing leaves intermediate between the fern-leaved type and the normal type, which he sent for comparison. The specimens were from the garden of W. FITZHERBERT-BROCKHOLES, Esq., of Cloughton Hall, Preston. Mr. HOSKING had since noticed the same variation on a Beech in Avenham Park, Preston. The branches bearing the intermediate foliage were intermixed with the ordinary branches, and did not arise from the base of the tree. Mr. HOSKING suggested that

The displays of hardy flowers were exceedingly fine. Mr. JOHN PETRIE, Crathes Castle, was successful in the principal class for such flowers. In the class for a collection of 20 varieties of cut flowers and fine foliage bedding plants, including annuals best adapted for flower garden decoration, the collection staged by Mr. A. GRIGOR, Fairfield, worthily won the premier honour.

The cool season has been exceedingly favourable to the growth of Pansies, and a good display was seen in the classes for these flowers. Mr. GILLESPIE, Aberdeen, took the chief honour with an exceptionally fine exhibit, including both show and fancy varieties. The decorative classes proved most interesting.

FRUIT AND VEGETABLES.

There was a considerable decrease in the number of entries in these classes compared with previous years, and the quality of the fruit, with the exception of the hardy varieties, was not equal to the standard usually seen at Aberdeen. There was only one entry in a class for a collection of eight dishes of fruits (Pines excluded). This was shown by Mr. DOUGLAS, and gained for him the Silver Cup presented to the society by his employer, Mr. Ogilvie, of Kepplestone.

For the best collection of six dishes of hardy fruits, Mr. JOHN KINNAIRD, Hazelhead, Aberdeen, won easily. Grapes were very poorly shown, and the berries were lacking in finish. Mr. W. S. MACKIE, Morken, led in the class for Melons, while the best Peaches and Nectarines were shown by Mr. HOWE, Fintray House.

Vegetables were exceedingly fine. The best collection of vegetables in 10 varieties were exhibited by Mr. DOUGLAS, Kepplestone. Mr. FRANK KINNAIRD, Broomhill, Aberdeen, won in the class for a collection of vegetables open to market gardeners only, with an excellent entry.

The exhibits of Potatoes were an outstanding feature, as is invariably the case at Aberdeen, the leading places being taken by Mr. FERGUSON, Linton Gardens; Mr. DOUGLAS, Kepplestone; Mr. WILLIAM COUTTS, Ellon; and Mr. WILLIAM LAWSON, Oakbank School.

Splendid produce was shown in the classes reserved for amateurs and working men.

NON-COMPETITIVE DISPLAYS.

Messrs. COCKER & SONS, Aberdeen, exhibited a collection of Roses of splendid quality.

Mr. M. H. SINCLAIR, Union Street, Aberdeen, had an exceedingly fine display of Gladoli, American Tree and "Malmaison" Carnations, sprays of hardy foliage (all named), Sweet Peas and other flowers.

Messrs. WILLIAM SMITH & SON, Aberdeen, made a fine display of plants in pots, hardy flowers, and floral designs.

Mr. JAMES ROBERTSON, Hadden Street, Aberdeen, had a display of Gladoli, hardy flowers, and Sweet Peas.

Mr. P. McHARDY, Aberdeen, showed hardy flowers, Sweet Peas, &c.

SOCIETY OF AMERICAN FLORISTS.

AUGUST 20.—The "Society of American Florists and Ornamental Horticulturists" held their annual convention at Philadelphia, Pa. The proceedings were opened on the above date, and continued for five days. We have been favoured with a copy of the speech delivered by the President, Mr. WILLIAM J. STEWART, of Boston, and from which we make the following extracts:—

THE MISSION OF THE SOCIETY.

To aid the horticulturist through the influence and power of concentration, by the gathering together, moulding and assimilating of the concrete wisdom of the many, and to bring the profession to a lively sense of their duties and privileges and a better realisation of what is possible through the medium of a well-supported central organisation is the task of this society. Its aim and its purpose have ever been to stimulate emulation, to broaden the channels of business, to promote the fraternal spirit, to help the gardener and florist in making for himself an honoured position in the commonwealth, and to inspire the profession

with a more correct understanding and better appreciation of the nobility of their calling, which, as Downing tells us, "is intrinsically the parent and superior of them all," because agriculture is the basis of all wealth and horticulture is the refined essence of agriculture.

GARDEN-HUNGER AND THE HORTICULTURIST'S OPPORTUNITY.

Modern suburban transportation facilities have given a tremendous impetus to the rural home idea. It is to the man skilled in horticulture that the home-maker will turn for advice, assistance, and material needed, and for those who grasp the opportunity in the right spirit there will be found abundant scope and full recompense for cultural knowledge and artistic talent. Nothing comparable to the present demand for hardy garden material has ever been experienced in this country, and no horticultural enterprise intelligently and diligently conducted can fail of success if existing conditions are understood and provided for. Tender material, also, will get its full share of the prosperity if used with better discretion as to its adaptations and limitations. For the ambitious, earnest young man, blessed with an artistic temperament, no departure of horticulture offers better emoluments or higher honour than that of outdoor gardening in all its branches. Within the scope of our vision to-day the field seems practically unlimited and the young generation may safely go into training for large responsibilities—every one will be needed. Under pressure of exigencies prevailing in the past the gardener has in too many instances been acquiring a one-sided experience, and some of our most talented indoor growers find themselves badly handicapped through deficient education in the fundamental operations of general gardening. The horticulturist who will make his mark in the future will not have these limitations, but will combine a thorough equipment for outdoor planting, grading, management and executive ability, with a fine knowledge of indoor operations and proficiency in the production of flowers and fruits under glass that will stand the test of comparison with the products of the specialist. Several of the agricultural colleges are doing good work, and turning out trained young men from whom we may expect much.

ROOM FOR IMPROVEMENT.

Too many greenhouses are devoted to crops for which neither the houses nor their owners are competent. We see acres of nursery space filled with antiquated stock; well-grown flowers sacrificed through careless handling or through inefficiency in the sales department; the once-prosperous flower-shipping business prostrated by short-sighted methods; the trade subjected to criticism because of the trumpeting of undeserving novelties. Our exhibitions are crude in method, faulty in manner of making awards or interesting the public. In every branch of activity there is room for better system. The arrangement of flowers, the planting of garden beds or the larger operations of beautifying an estate or creating a landscape picture, in many of which, as we see them from day to day, the qualities of originality and artistic intelligence in form and colour harmony are conspicuously lacking, show conclusively the need for study and self-education in artistic taste before we are properly fitted to instruct the public. It is the province of the florists' club to seek out and apply the remedies for all these deficiencies, and it becomes the duty of the craftsman in justice to himself and his fellows to uphold in every possible day his local organisation, and do his share towards the general advancement which is sure to follow the fraternising of congenial spirits whose material interests are identical.

OUR RELATIONS WITH OTHER ORGANISATIONS.

There is nothing more to be desired to place this organisation in a position of greatest usefulness than some system of direct affiliation with existing or prospective special and local organisations. Far from regarding these societies as a possible menace I look upon their multiplication as distinctly to our advantage. The field is practically limitless, and we can well afford to nourish any and all well-meant efforts to build up horticulture in any of its branches. There is an infinity of specialised detail and local work which the smaller and more compact bodies can care for with an

efficiency far beyond the reach of a society constituted as this is. Let them do it if they will, and wherever and whenever the time comes that they find their burden heavy and the road rough, let us put our big shoulder to the wheel and help them. On the contrary there are movements where a successful consummation is only possible under the capacious mantle of a large national organisation. Events of the past year have indicated to us how at any moment we may be called upon to champion the cause of some branch of the trade where strength of numbers and national incorporation become elements of great strength, and where the existence of a powerful representative body serves as a restraint and defence against corporate plunder. I believe we should keep working on this problem of closer relations until some feasible plan of permanent affiliation and intelligent co-operation has been evolved and a system of specialised work established through these auxiliary bodies.

PLANT REGISTRATION.

A well-regulated system of plant nomenclature is needed. It would be an element of great stability if all registration of varietal names could be recorded in one universally recognised bureau. Whether this should be done direct by the owner or first pass the scrutiny of a specialised society, where such exists, is of little consequence, provided it finally comes into the custody of a central authority having the power to follow up infringement and extend the fullest protection within the law to the originator or owner. This central authority, I believe, should be the Society of American Florists and Ornamental Horticulturists.

TWO IMPORTANT DUTIES OF THE SOCIETY.

The time seems now ripe for us to insist that horticulture be made a regular course in our public school system. There can be no question of the wisdom of this society's taking an advanced position on this matter and fostering liberally all movements for the dissemination of garden knowledge through this means. Every argument on physical, mental and moral grounds is on our side.

As a society we should lend aid and encouragement to any investigation or experimentation for the purpose of stimulating the production of any horticultural material for which we have hitherto been obliged to depend upon foreign sources of supply. "Made in America" is an inscription too seldom seen on horticultural goods. How can this organisation best assist to that end? In the case of those goods which we must import, there is room for a better system and improved facilities in the appraisers' department, and I hope our legislative committee will give this question the attention it deserves.

PARCELS POST NEEDED.

The project of a parcels post is a reform worthy of our hearty support. A cheaper and more reliable means of distribution for packages of limited size and weight, such as is enjoyed in most European countries, would greatly benefit the plant and bulb trade, and provide the means for supplying the public at small cost with plants of a size that might be seen without the aid of a microscope and might be nurtured into large specimens without the use of an incubator. Were it not for the express companies a parcels post would have been a reality long ago—so we are told. The express companies and the S.A.F. have been making one another's acquaintance of late and find they don't think alike on some things.

STATE VICE-PRESIDENTS; OUT-DOOR EXHIBITIONS.

I am satisfied that the present system of selecting State vice-presidents to represent this society sectionally might be improved upon, and would suggest that you consider the adoption of some system whereby, in those localities where any organisation exists, we might through mutual arrangement confer upon the presiding officer the honour of representing the S.A.F. in his territory during his term of office.

It is much to be regretted that the Executive Board found conditions so unpropitious for an outdoor exhibition of planted material in connection with this convention that the project had to be abandoned. It was hoped by many

that the humble beginning made in Dayton might be followed up, and that in time an outdoor exhibit might be made a regular feature of our conventions, but in a large city the difficulties seem almost insurmountable. Wherever circumstances permit I believe it will be good policy to provide at least for a planting of such novelties as cannot be properly presented in an indoor exhibition.

NATIONAL FLOWER SHOW.

As the National Flower Show project will be reported on at the proper time by the very competent committee of fifty under the chairmanship of my predecessor I will not take your time now with any reference to it other than to submit that it would be a grave mistake to make any change from the time-honoured date for holding our annual convention. If it is thought wise to have a meeting at Chicago at the time of the exhibition, let it be a special meeting called as provided for in the by-laws. The proposition to merely meet formally in August so as to comply with the constitutional requirements, and then adjourn over until the time set for the flower show, would, I firmly believe, very seriously affect the prosperity of the society.

THE SOCIETY'S GOOD RECORD.

The birth of the Society of American Florists was the outcome of a conviction on the part of its promoters that the horticultural interests of America were ready to get together for mutual advantage and the uplifting of their art. The young society found the commercial florist, as a rule, isolated and provincial because of the lack of opportunity for any but the most limited intercourse and interchange of opinion and experience. Not one society, club or periodical devoted primarily to the interests of floriculture existed on this continent. The best test of the wisdom of the founding of any institution is what it has been able to accomplish. Do you not think that the seed sown 23 years ago has borne good fruit? The yield might have been increased many fold had everyone in the profession who needed just this help taken advantage of it; still, it is not too much to say that the S.A.F. has been the underlying force which has in this brief period placed American floriculture on an eminence where it commands the respect of the world, and that the splendid confidence of its founders in the future magnitude of their profession has been well justified. The spirit of progress which prompted them to break the shackles of past isolation and secretiveness and throw wide open the doors for a general intellectual and material advancement is still our best asset. We must allow free scope to the mighty reserve forces of American horticulture and be constantly on the alert to see and act upon every opening for strengthening our hold upon the heart-strings of the profession.

WHAT CONVENTIONS ARE GOOD FOR.

The society is to be congratulated on the magnificent attendance at this meeting. Conventions are always an incentive and encouragement. They give zest to work, feed the intellect, enrich our literature. They are a unifying force, establishing and cementing friendships and bringing into advantageous contact those who, although widely separated, are actuated by a common purpose in life. I pity the man who sees nothing to interest him here, and finds no inspiration in such gatherings, no strength to help him surmount the daily recurring difficulties which are our common lot, no advantage in the opportunity to inspect this great industrial exhibition. Little does he realise how great is his loss.

BRITISH GARDENERS' ASSOCIATION.

At the last meeting of this association, held at the R.H.S. Hall, Westminster, Mr. R. L. Castle in the chair, 17 new members were elected, bringing the total up to 1,095. Arrangements were made for the preparation of a certificate and diploma, after careful consideration. A request having been received from Newport, Monmouthshire, to hold a meeting, the secretary was appointed delegate to deliver an address on September 18. A conference on "Examinations for Gardeners" will take place at the Royal Botanic Society's Gardens, Regent's Park, on September 12, at 6 o'clock. J. W.

ANSWERS TO CORRESPONDENTS.

AMATEURS AT FLOWER SHOWS: *Correspondent.* The term "amateur" is sometimes used to describe an exhibitor who cultivates his own produce without the aid of a trained gardener, but in other cases it is used in a broader sense to distinguish a private grower from a nurseryman, even though the former employs a professional gardener. No person who sells plants can be regarded as an amateur, nor any person in the employ of a nurseryman. If the schedule be made to read "An amateur gardener who employs no professional help," or "an amateur owner," the distinctions will be sufficiently clear.

AQUATIC WEEDS: *W. P. B.* An article dealing with the best methods of combating aquatic weeds was given in the weekly Calendar on "Public Parks and Gardens" in the issue for May 25, 1907.

BLACK PANSY: *F. C. R.* There are several varieties of deep purple, almost black, Pansies already in commerce.

BOOK OF GARDEN RECEIPTS: *H. & G.* *The Horticulturist's Rule Book*, by L. H. Bailey, the Garden Publishing Company, Ltd., New York, U.S.A.

CARNATIONS: *G. C.* There is evidence of the puncture of small insects followed by an irruption of bacteria. The cultivation appears correct.

FIG. 73.—THE DEATH'S HEAD HAWK MOTH (ACHERONTIA ATROPOS).

CATERPILLAR: *W. S.* The caterpillar is the larva of the Death's Head Moth (*Acherontia atropos*) (see fig. 73). It feeds frequently on Potato plants.

CATTLEYA LEAVES DAMAGED: *Derby.* The plants have been attacked by thrips, which have probably resulted from cultivating the specimens in too warm an atmosphere with insufficient ventilation. Cut off the worst leaves and sponge the plants occasionally with a diluted insecticide. Admit more air to the structure during warm weather.

CORRECTION.—On p. 160 of the last issue *Macrosporium rhabdiferum* was inadvertently printed *M. rhalidiferum*.

CUCUMBER LEAVES: *A. B.* The leaves are spotted by *Oidium Balsami*, and this is apparently caused by the presence of too much moisture. The Begonia leaves are not affected by any disease.

CUCUMBERS: *C. L.* The fruit appears as if starved for lack of proper and sufficient nutriment. There is no disease present.

FERN: *D. E.* Not having arranged the questions to be submitted at the examination, we cannot attempt to explain exactly the views the examiners may have regarding their interpretation. As a rule, it is best in such cases for students to observe the literal reading of the questions.

GRAPES: *T. W. S.* There is no disease on the berries and no evidence in the Grapes themselves of the cause of the browning, which must be due to some local condition.

MANURES FOR SPECIAL CROPS: *Amateur.* Sweet Peas may be watered very occasionally with a solution containing a quarter of an ounce each of kainit and superphosphate of lime and an eighth of an ounce each of nitrate of soda and

iron sulphate, to two gallons of water. You should select plump corms of Gladioli for planting in window-boxes, and plant them in a rich, sandy loam. Great attention must be given to the watering of all plants in window-boxes.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

FRUITS: *W. G. W.* The Nectarine Peach. The Grape resembles Canon Hall Muscat.—*J. Service* and others. We cannot undertake to name Peaches with any degree of certainty unless particulars are sent as to whether the tree bears large or small flowers and if the flowers are richly coloured or pale. It is also necessary to send us leaves for the examination of the glands.

PLANTS: *F. B.* 1 & 2, varieties of *Fuchsia magellanica*; 3, *Spiraea japonica*; 4, *Spiraea japonica* bullata; 5, *Cornus macrophylla*; 6, *C. sanguinea*.—*A. C. F.* *Juniperus pseudo-Sabina* and *Cupressus thuyoides*.—*G. E. W.* *Astrantia major*.—*J. P.* 1, *Clematis viticella*; 2, *Sempervivum tortuosum variegatum*; 3, *Codiaeum (Croton) variegatum elegantissimum*.—*F. T.* *Hypericum perforatum*.

ODONTOGLOSSUM ROSSII: *D. A. L.* The variety you send is distinct from the species and very attractive, although not so showy as the best richly-coloured varieties.

PLUM TREE: *W. C.* There is no local disease in the leaves to cause the spotting and decaying. No fungus appears until the spots are quite dead, and then a small fungus—a species of *Phoma*—occurs on the spots, but does not cause them. Is it certain that the roots of the trees are in a proper condition?

PRONUNCIATION OF PLANT NAMES: *T. J.* If you have a copy of Nicholson's *Dictionary of Gardening* you will find a pronouncing dictionary in the supplement to that work.

SEEDLING CARNATIONS: *H. F. G.* As far as the variety can be judged from single flowers only they appear to possess qualities that should make them valuable garden plants. But in order to ascertain whether they are better than existing varieties it would be necessary to compare the flowers, and to have a knowledge of the habit of growth possessed by your plants. The blooms are certainly attractive, and they have non-splitting calyces. Two of the best are number 2 of rosy-salmon colour, and number 4 rich maroon-crimson.

SWEET PEA: *W. H.* There is no fungus disease present and nothing to account for the failure. It must be due to some local cause.

VARIETIES OF NECTARINE: *G. T. B.* Humboldt is a good Nectarine and may be forced satisfactorily, but it is not one of the earliest. Cardinal and River's Early ripen before all others, and they force well. Lord Napier may also be forced. Late fruiting varieties include Spencer, Darwin and Milton, which are all good sorts. Of early ripening Peaches, Hale's Early and Duchess of Cornwall may be recommended. These should be followed by Crimson Galande and Bellegarde, and later by Lady Palmerston, Sea Eagle, Golden Eagle, and Thomas Rivers.

HAMPTON COURT GARDENS.

[SEE FIGURES 74, 75, AND 76, ALSO SUPPLEMENTARY ILLUSTRATION.]

THE great charm of these public gardens is in the mingling of the older style with the more modern manner of flower-gardening. Probably no public garden has made the same advance in the matter of decorative gardening as that at Hampton Court, during the twelve years or thereabouts that Mr. J. A. Gardiner has filled the position of superintendent.

Not many years ago the quarter called the Wilderness was a very uninteresting part of the garden, with gravel walks winding among Laurels and other ordinary shrubs. At the present time its features are really more in conformity with wild nature than before, for it is planted with a representative collection of flowering and foliage shrubs, and in its centre, on the site of a former rubbish heap, has been constructed a rootery, and this is planted with Ferns, Alpine, and trailing plants. Tall Bamboos, pillars of Wichuraiana Roses, species of Rubus, Clematis, &c., are planted thereabouts. The stretch of water in this portion of the grounds, whose banks were formerly clad in the manner familiar on the backwaters of the Thames, is now beautified by gigantic Gunneras and similar foliage plants, a collection of Irises, and representatives of many other plants which thrive in marshy ground and have been planted at the sides of the water-

course. The surface of this water is ornamented by the fine foliage and the showy flowers of Water Lilies for which the gardens are noted.

The flower-border on the east front (see fig. 75) is about a quarter of a mile in length. Our illustration represents this border in its spring garb of Forget-me-nots, Tulips, Violas, Crocuses, &c., with Wistaria chinensis blooming on the wall. Now it is brilliant with Phloxes, Asters, Fuchsias, Violas, and a variety of flowering plants, both annual and perennial. The subjects are cleverly disposed in order that there shall be as little repetition as possible throughout the whole length of the border. The more important subjects are planted in groups, each kind being massed together separately. Chrysanthemums have been in flower since July, and they will continue to brighten this border until winter arrives; Bouvardia Humboldtii corymbiflora is bearing large masses of

ally good this season. The method adopted of planting several sets of plants of different heights is eminently suited for large flower-beds, as it admits of the use of a variety of subjects and at the same time adds to the scenic importance. A good example of these beds is seen in fig. 74. This has a very effective appearance and is composed of Violas, Yellow Broom, and Rhododendrons (Azaleas). Among the whole of the large number of these flower-beds not two are alike. One very pretty bed is furnished with grafted standard plants of Abutilon megapotamicum growing over the purple-flowered Salvia Horminum, and carpeted with variegated Holcus and dwarf Cockscombs, an edging of Echeveria glauca completing the whole. Another bed is planted with pyramid golden-leaved Fuchsias, white and green Abutilon Savitzii, pyramid Iresines, and Acalyphas with a base of variegated Veronicas. In several beds the double pink variety of

[Photograph by W. J. Vasey.]

FIG. 74.—A FLOWER-BED AT HAMPTON COURT.

its white, fragrant flowers; Calceolaria Burbidgei furnishes good, light yellow colour; patches of blue are formed by Salvia patens, and other species of Salvia furnish masses of brilliant scarlet-coloured flowers. Cuphea platycentra appears in bushes covered with tubular red flowers, Cassia corymbosa, Streptosolen Jamesonii, Plumbago capensis, various Abutilons, Agapanthus umbellatus, and other showy flowering plants commonly seen in greenhouses are in great beauty in this border. Asclepias curassavica, groups of the Tiger Lily (Lilium tigrinum); the white L. longiflorum, Lantana salvæfolia, Mina lobata, and countless showy perennials lend variety and are displayed to the best advantage.

The numerous flower-beds facing to the east front of the Palace have been exception-

tuberous rooting Begonia "Major Hope" forms a pleasing display, but in each bed a different variety of plant is used to form the taller subject, and variation in the edging is also insisted upon so that the beds will not be alike. When seen at a distance, the taller plants in the beds catch the eye first, and of these, the flowering Campanula pyramidalis, Cannas, Lilies, standard Heliotropes, tall Hydrangea paniculata, and Fuchsias are the more prominent subjects. A nearer view reveals the beauties of the second highest tier of plants in Verbena venosa, flowering Pelargoniums, Begonias, Celosias, &c., and a close inspection the more delicate effects of the varied carpetings and edgings of the beds. This style of bedding is specially suitable for large gardens.

Stately links with past ages are afforded by

the fine rows of aged Yews (some of which may be seen at the back of the flower-bed illustrated at fig. 74) and the shady avenue of Elms (fig. 76), all of which are said to have been planted at about the year 1690. The Elms are nearly all hollow, and they do not appear to have increased in size for many years, although they are carefully tended and everything possible done to keep them in health. The shoots are cut back every year, to be replaced by a similar scanty crop of leaf-bearing twigs in the following season, and this trimming helps to preserve their old-time appearance. Several of the trees, however, are in an enfeebled condition, although, like the proverbial creaking door, they may yet hang long on the hinges.

On the way to the vinery, which contains the historical vine—again well-cropped despite its great age—is encountered the Dutch or Tudor Garden shown in the supplementary illustration. This old-time feature is carefully retained in the original form, and as many old-fashioned flowers as possible are used for its embellishment. The centre rises in a grassy cone, from the middle of which a spreading jet of water falls into the basin below, which is planted with coloured varieties of Water Lilies. The walks are formed of irregularly-fitting paving-stones, and between these stones, Stonecrops, Cerastums, Spergula, and other low-growing plants appear, the mossy surface of the stones being in keeping with the general effect.

In the flower-beds are varieties of Dianthus, Violas, Marigolds, Candytufts, Antirrhinums, Verbenas, and many scented flowers both annual and perennial. At the back of the surrounding border rise the tall inflorescences of Sunflowers, brightly-coloured Phloxes, Larkspurs, Hollyhocks, Foxgloves, &c., and Sedums, Saxifragas, and many Alpine flowers appear in the irregularly-planted front. This pretty garden being enclosed forms a pleasant retreat, and, owing to the great variety of flowers used in its adornment, it is an interesting spot for all who delight in gardening.

From early spring until late winter the gardens at Hampton Court are bright with a display of flowers. Beginning with the *Iris reticulata* and *Chionodoxas* peeping through the snow, they are soon followed by myriads of Crocuses, Snowdrops, Tulips, and Daffodils that appear in the grassy slopes around the Wilderness, and on the borders of the long stretch of water. Probably these early spring flowers are more admired than the later brilliant show of summer-blooming plants. In autumn Michaelmas Daisies, Dahlias, perennial *Helianthus*, *Chrysanthemums*, and other flowering plants prolong the season of flowering well into winter, and when flowers are no longer possible outside, the beds are planted with low-growing, ornamental shrubs. A reserve of plants is kept ready in the nursery, so that any failures in the beds may be immediately replaced.

Mr. J. A. Gardiner, it will be remembered, has been appointed superintendent of the London Central Parks, in succession to the late Mr. Jordan, and Mr. A. Springs, who has long acted as foreman under Mr. Gardiner, is to succeed that gentleman in the management of the gardens at Hampton Court.

ORCHID NOTES AND GLEANINGS.

THE above interesting pedigree of plants bearing flowers, principally brown, overlaid upon a yellow ground colour, yields, as might be expected, another member of the great Harryanum family in which that potent species is at once recognisable, for though there are three other species concerned, it dominates in this resultant cross to about three-quarters of its appearance.

The sepals and petals are narrow, and, in form, like *O. Harryanum*. The colouring is of

coloured more or less, for in *O. cristatellum* the anther cap is dark brown.

The influence of the heavy blotch in the lip of *O. cristatellum* is strong; the ♀ parent of this cross is the ♂ parent of one of my crosses upon *O. crispum* with unblotched lip, and it produced *O. Urania*, all of which are heavily blotched on the lip. Such comparisons are interesting.

ODONTOGLOSSUM × AMONASRO.

O. × CRISTATELLUM ♀ × *O. × HARRYANUM* ♂

THE female parent of this plant is a far superior variety to the female parent of *O. Amneris*, being rounder, broader, brighter yellow in the ground-colour, and of deeper blotching. Its lip also is almost covered with deep brown, the spikes being long and arching, having carried as many as seventeen flowers; this will account for the differences in these two plants as they develop in the future.

This cross shows in an unmistakable manner

[Photograph by W. J. Vasey.]

FIG. 75.—PORTION OF THE FLOWER BORDER, UNDER WISTARIA-CLAD WALL, EXTENDING ALONG THE FRONT WALK AT HAMPTON COURT.

light chestnut-brown upon a greenish-yellow ground, which shows through in a few distinct bars, and at the base of the petals, is the usual slight purplish shade suffused into the brown. The petals stand forward at an angle of 45° to the plane of the flower.

The lip is the prominent feature, 1 × ¾-inch, bright sulphury-yellow, three parts of it being covered by a brown blotch that has a slight suffusion of lilac; extending along the side for half way are lines of similarly coloured pencilings.

The crest closely resembles that of *O. Harryanum*, the wings being a little thicker and more expanded.

The anther cap is yellow, as in *O. Harryanum*, but I have no doubt subsequent ones will be

the powerful influence of the smaller-flowered species *O. cristatum*, acting through the female parent, on the larger flower of *O. Harryanum*, and in this characteristic it is comparable to *O. Lindleyanum*, acting through *O. Wattianum* in *O. Ariadne* (see *Gardeners' Chronicle*, August 10, 1907, page 101).

In form and colour the flower is a very large edition of the female parent, excepting the lip, which combines the character of both parents, but *O. Harryanum* in the less degree.

The sepals and petals are covered, as to the outer half, with rich, blackish-brown, and the inner half is closely spotted on a greenish, bright yellow ground.

The lip is almost white, but shaded slightly with yellow here and there, resembling in

form that of luteo-purpureum having a broad base and slightly expanded blade, the front much rolled into the apiculus, which is very marked in the female parent. The keels and five pairs of large filaments form a very beautiful crest, which is yellow lined with brown.

The column is yellow, the stigma very large and round, the wings large and quite unlacerate, widely margined with brown. The anther cap is deep brown. *de B. Crawshay.*

THE BULB GARDEN.

LILIUM SULPHUREUM.

WHEN this *Lilium* was first introduced into this country there was divergence of opinion as to its proper name. In the *Gardeners' Chronicle*,

varies considerably; 5 feet to 6 feet is the average in the open, but when grown under glass it becomes much taller, and a plant in the greenhouse at Kew is 11 feet in height. One of the Kew specimens has developed 10 flowers, whilst others have eight and five. The tubular blooms are slightly pendant, 9 inches in length, and they measure 7 to 8 inches in diameter. The interior of the tube is yellow, and this fades towards the edge until it becomes a creamy-white; the exterior surface is tinged with purple, which is of a deeper shade in the flowers grown in the open. The blooms exhale a delightful odour.

Lilium sulphureum should be given a loamy soil rather than one containing peat. The stock may be easily increased from bulbils, which are freely produced in the axils of the leaves on the

NOTICES OF BOOKS.

ECONOMIC MYCOLOGY.*

IT is satisfactory that efforts are now made in this country to follow the example pursued for so many years in the United States of America of publishing from agricultural colleges and stations periodical reports on the various fungous diseases which, from time to time, attack cultivated plants. It has long been a source of regret that little or no effort has been made to disseminate trustworthy information on these diseases, with suggestions for their treatment.

The present report commences with that prevalent disease, the "brown rot" of Cherries, which also attacks Apples and other succulent fruits, giving a description of the disease, and methods by which it should be attacked.

This is followed by the "Cherry leaf scorch," a more recent disease, which has of late years seriously affected the Cherry orchards in some parts of Kent. This communication is illustrated by excellent plates, and is almost exhaustive of the subject.

Following upon this, the Apple Scab, or "black spot" comes in for notice. The disease appears to be unusually prevalent this year, and is evidently the cause of severe losses to Apple growers all over the country. Here, again, the information is of the most practical kind, well illustrated, and embodying many useful suggestions.

The "Crown gall of Lucerne" is one of the most modern of agricultural pests, and it is now brought to the notice of farmers, in many instances, for the first time.

The "European Gooseberry-mildew," with especial reference to its attacks on Red Currant, follows, and occupies the remainder of 25 out of the total of 58 pages.

From this point forwards the report is occupied by "The American Gooseberry-mildew in England, and the need for legislation." And here I regret to find that the reporter abandons his function of imparting information. From this point, therefore, I must leave the report to justify itself, inasmuch as I fail to recognise the good taste of introducing methods of personal recrimination into departmental reports. *M. C. C.*

LECTURES ON PLANT PHYSIOLOGY.†

By the recent issue of a translation by Prof. R. J. Harvey Gibson of Dr. Ludwig Jost's *Lectures on Plant Physiology*, students of botany in this country are once more indebted to the triple alliance of German scholarship, a good translator, and the Clarendon Press. In a substantial 8vo. volume of nearly 600pp., with 172 illustrations, Dr. Jost has compressed a thorough survey of the whole field of plant physiology in the light of present knowledge. It is probably unequalled as an up-to-date treatise. For the first time the recent researches of Haberlandt, Nemec, Correus, De Vries, Czapek, Pfeffer, and others are available to English readers in a single text-book of reasonable size.

The German edition appeared in 1903, and in its present form we are fortunate in having the author's corrections and additions up to 1906.

The 43 lectures are classed in three groups, treating respectively of Metabolism (plant chemistry, absorption, and conduction of water, assimilation of carbon and nitrogen, respiration, etc.), Metamorphosis (growth, reproduction, heredity, and variation), and Movement (transformation of energy and response to stimuli).

Although a work covering so wide a field must of necessity be a compilation, yet the present volume is something more than this. Dr. Jost

[Photograph by W. J. Vasey.]

FIG. 76.—AVENUE OF POLLARDED ELMS AT HAMPTON COURT. (See p. 178.)

October 24, 1891, p. 480, Mr. J. G. Baker describes it under the name of *L. Wallichianum* var. *superbum*. A coloured plate published in the previous year in *The Garden* bears the name *L. ochroleucum*. Eventually the plant was made a distinct species and named *L. sulphureum*, under which name it is figured in the *Botanical Magazine*, tab. 7237, and *Gardeners' Chronicle*, September 15, 1906, p. 190.

The plant first flowered in this country in Messrs. Hugh Low and Company's nursery, and was exhibited by this firm at the meeting of the Royal Horticultural Society on June 25, 1889, when it received a First-Class Certificate from the Floral Committee. The height of the plant

upper half of the stem. When fully matured the bulbils should be harvested, and be dibbled at once into sandy soil in boxes. The following year they should be planted in a frame or in a situation in the open that can be protected from severe weather. The bulbils will flower when from three to five years old.

L. sulphureum can be cultivated quite easily in pots, but much better results are obtained by planting the bulbils in a bed or border of the conservatory or greenhouse. The best group of this *Lilium* I have seen in the open air was planted in the ordinary soil of a suburban garden, with a little lime rubble and chicken manure mixed with it at the time the bulbils were planted. In Devonshire and Cornwall it does splendidly in the open. *D. D.*

is a competent critic, and preserves an independent attitude throughout. The author, while pointing out the difficulties in the way of accepting certain arguments and theories, is never in a hurry to put forward an alternative explanation, or to substitute a solution of his own. He keeps in touch with current work and new views, but preserves an open mind, and does not hazard a positive opinion unless sufficient evidence has been accumulated on one side or the other. Thus the indefiniteness and inconclusiveness of several of the lectures, whilst a true reflection of the present state of our knowledge, will be disappointing to those who like to take opinions and judgments ready made. Yet it is just this judicious and critical attitude which makes the book one of peculiar value to the genuine student, for it trains him to think for himself, and leaving him unsatisfied, tempts him to follow up the points in question by reference to the original authorities (which are quoted in the bibliographies appended to each chapter), or even to attempt to solve them on lines of his own.

We do, however, find here and there expressions of the author's opinion stated in no uncertain fashion, and these are of interest as indicating his point of view in regard to some of the prominent questions. For example: "As our knowledge increases, the distinction between the different types of variation may be broken down; still, it is certain that mutability will remain the *chief*, if not the only factor in species formation"—page 395. "To attribute to the chromosomes, or, indeed, to the nucleus at all, the exclusive possession of the initials [hereditary factors or units] is a view which has in no sense been justified. . . . We conclude that the chromosomes are not definite *organs* of the cell . . . they are re-formed at each division, and hence the chief basis for believing them to be transmitters of hereditary characters disappears"—p. 378. "We . . . regard it as established that the supposed distinction between somatic and germ-cells does not in reality exist at all"—p. 380. With reference to Haberlandt's "light-perceptive organs," Dr. Jost says: "The experimental evidence in favour of the function of the ocular cells will scarcely stand critical investigation"—p. 475. In the two lectures on Geotropism, we have an excellent, though necessarily brief, summary of the various theories of graviperception, statoliths and otherwise. It is noteworthy that the author never digresses into mere hypothesis and vague theory, but keeps throughout in close touch with objective facts, and makes reference in practically every paragraph to facts and experiments on which the theories are founded.

In a book so replete with details, it is important that each subject should be easy of reference, and in this connection we could have wished for a more complete index.

There is a good summary of the contents at the commencement, but why in the table are some portions of the contents grouped in chapters, when in the body of the book there are no such divisions?

We do not, however, wish to end in a tone of criticism, but rather in one of gratitude to all concerned in the production of this admirable book.

GLEOSPORIUM DISEASE OF CURRANTS.

THE *Gloeosporium* disease of Currants is a leaf disease. Affected leaves are covered with numerous brownish, confluent spots, in which small cushions of spore-masses are visible under the microscope. The leaves begin to curl and eventually fall off. This generally occurs at the time the fruits are in full development, and, in consequence, they experience a sudden check in their growth, and begin to prematurely colour, shrivel and to drop. The accompanying illustration shows three twigs of a Black Currant bush almost defoliated. I have been told by a

large grower of Black Currants that the disease has caused this year more damage to the fruit crop than was ever the case with the "Big Bud" mite (*Eriophyes ribis*).

The fungus causing this disease formed an interesting memoir by Dr. Klebahn in *Zeitschrift für Pflanzenkrankheiten*, Vol. xvi., pp. 65-83. We find that the following species of the fungus cause similar injury on:—

Gooseberry = *Gloeosporium ribis* (Lib.) Mont. et Desm.

Red and White Currant = *Gloeosporium ribis* (Lib.) Mont. et Desm.

Black Currant = *Gloeosporium curvatum*, Oudemans (Mat. flor. Néerl. II. 28).

Dr. Klebahn, through a series of experiments, proves that the fungus hitherto known as *Gloeosporium ribis*, is only a form of a higher fungus, which he succeeded in cultivating. He observed on leaves, which had fallen to the ground and

FIG. 77.—SHOOTS OF BLACK CURRANT BUSH AFFECTED WITH *GLEOSPORIUM*.

remained there through the winter, a form which developed from the *Gloeosporium*, and was similar to the well-known Larch canker fungus *Pseudopeziza Willkommii*. He kept this fungus, to which he gave the name *Pseudopeziza ribis*, under observation, and established by experiments that the spores of the latter form developed into the same *Gloeosporium*, with which he succeeded in re-infecting Currants.

The fungus which caused the injury on the Black Currants, as illustrated, is described as *Gloeosporium curvatum*, a different species, with the spores of which no injury could be produced by infecting Red or White Currants, but affection was readily made on Black Currants. From the evidence of the fungus on Red and

White Currants, it may safely be concluded that this fungus (*G. curvatum*) may yet either prove to be identical with *G. ribis*, or that it possesses another *Pseudopeziza* form. The work of Dr. Klebahn is so recent, that no experiments with the Black Currant fungus have been reported in Germany, and it seems doubtful that there will be any, because the culture of the Black Currant in Germany is being very little practised.

This question is of more importance to English observers, and I hope, by the means of these lines, to find some independent co-workers! Though this investigation is more or less laboratory work, yet it is of economical value also, for it plainly illustrates the harm resulting from the bad practice of letting the leaves decay under the bushes; they should be collected and burned in all instances where the plants have been attacked.

Recent experiments dealing with the cure of this disease have been published by Dr. Ewert, of Proskau, whose interesting memoir on "Seedless Fruits" will still be in the memory of the readers of this journal (see *Gardeners' Chronicle* for May 18, 1907).

Dr. Ewert made experiments in a plantation of Red and White Currants (see *Zeitschrift für Pflanzenkrankheiten*, Vol. xvii., pp. 158-169), which showed pronounced injury by *Pseudopeziza ribis*, Klebahn (*Gloeosporium ribis* (Lib.) Mont. et Desm.). He treated some of the infested bushes with copper solutions and left some untreated. The solutions mainly employed were 1 per cent. and 4 per cent. solutions of the Bordeaux mixture, and 1 per cent. solution of basic acetate of copper, known as verdigris. He began spraying on April 4, and sprayed twice each week until May 30, with 1 per cent. and 4 per cent. solutions of the Bordeaux mixture and 1 per cent. solution of verdigris. The fruits were harvested on July 10 and 11, and the experiments showed plainly that the bushes treated were almost all free from disease, whilst those left untreated lost all their leaves. The results further showed that spraying till the middle of April was of no marked result. Thus it is obvious that the main time of infection is during the month of May. It is important to further state the results obtained by spraying with 1 per cent. or 4 per cent. Bordeaux mixture, or 1 per cent. solution of verdigris. The Bordeaux mixture undoubtedly takes the first place, because the verdigris solution showed a pronounced injurious influence on the foliage. Though the 1 per cent. solution of Bordeaux mixture has been employed for nine consecutive weeks, twice weekly, it by no means completely arrested the disease, though the disease certainly lost in virulence. The 4 per cent. solution of Bordeaux mixture left plain bluish incrustations on the leaves, and it was feared that the assimilation capacity of the leaves would suffer; these fears were realised, though the injury resulting from spraying with a 4 per cent. solution was much the smaller evil of the two. The rains washed off much of the fungicide. The experiments prove that copper solutions, especially the Bordeaux mixture, are excellent remedies for the *Gloeosporium* disease. Though the author, in his experiments, deals only with Red and White Currants, there can be little hesitation in saying that a like treatment of all infected species or varieties of Ribes will prove equally successful. In conclusion, it is to be said that the *Gloeosporium* disease is a malady of "old age." Bushes and leaves of even the more susceptible varieties must have attained a certain age before they are attacked. H. T. Güssow.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 84-90.)

(Continued from page 172.)

7.—ENGLAND, N.W.

CUMBERLAND.—Considering the continued cold and wet weather, the fruit crops in this district are remarkably good. Green and black aphids, however, have been very troublesome, but on trees which were sprayed with an insecticide the results generally are good. Gooseberries, Black, Red, and White Currants are much over an average in quantity. Strawberries were plentiful, and, being backward, the fine weather is

July greatly benefited these fruits. The soil in these gardens is of a light, sandy nature. *William Scott, Eden Hall Gardens, Langwathby, R.S.O.*

— The promise of a good Apple crop was excellent up to the second week of May, but the cold, sunless weather, with frequent rains, after that date caused the fruits to set badly: a few varieties of Apple trees are carrying fair crops. All fruit will be very late in ripening this year. The Loganberry is fruiting splendidly; the berries are excellent for jam-making, and it is a valuable addition amongst hardy fruits. Our soil is a light loam, resting on a sub-soil of bastard clay. *Thomas Tunstall, Carleton House Gardens, Penrith.*

LANCASHIRE.—We have good crops of all kinds of fruits with the exception of Apples, which are a total failure. Many Apple trees are without a single fruit, whilst another tree of the same variety close by is carrying a fair crop. Old Apple trees have made a few inches of growth only. I attribute the failure of the Apple crop to the continuous rains, for, during a period of 70 days, only five were without rain. *Wm. P. Roberts, Cuerden Hall Gardens, Preston.*

— The excessive rains and cold weather adversely affected the fruit crops, especially on our cold, heavy soil, and the early promise of an abundant yield is not realised. Black fly has been very troublesome on trees bearing stone fruits, and green fly on Currant bushes. Caterpillars have not been quite so troublesome this season as in former years. Strawberries decayed on the ground instead of ripening. Our soil is a cold, heavy loam on a subsoil of clay. The aspect of the gardens is to the north-west, so that crops are always late in maturing. *E. F. Hazelton, Knowsley Gardens, Prescot.*

— The fruit crops, and especially Apples and Pears, in this district have suffered greatly from an absence of sunshine and continued low temperatures, followed by an incessant rainfall during the time the trees were in bloom. On April 17 9° of frost were registered, with the result that many of the fruits on early varieties of Pear trees dropped and the same thing happened with early Apples. Small bush fruits are a good average yield, especially Black Currants, Raspberries, and Loganberries. Strawberries have been very poor in quality, while many of the berries and much of the foliage have been attacked with mildew. *B. Cromwell, Cleveley Gardens, Alkerton.*

— The late spring frosts occurring whilst the trees were in full bloom and heavy with moisture caused much damage to the Plum and Damson crops in this neighbourhood. Apples also suffered severely from these causes, and Pears to a lesser extent. Some varieties of Apple trees are carrying full crops of fruits, and others have none. Of Pears, Louise Bonne of Jersey, Marie Louise, Easter Beurré, Beurré d'Amanlis, Beurré d'Aremberg, Beurré Diel, and Doyenné du Comice are the best fruited. Plums, with the exception of Victorias, are a failure. Strawberries suffered from the excessive rains, and many of the best fruits rotted before they were ripe. Taken altogether, the present is the worst fruit season in my experience of nearly 40 years. Our soil is a dark, sandy loam, generally overlying white sand. *Ben Ashton, Latham House Gardens, Ormskirk.*

WESTMORELAND.—Apple trees when in bloom promised well for a plentiful crop, but the continued wet, cold, and sunless weather during May and the early part of June ruined the fruits. Pears have also suffered from the same causes. Wall trees of Victoria and Gage Plums set heavy crops of fruits, and many have had to be removed. All crops are very backward, and unless bright weather ensues I am afraid many of the hardy fruits will not ripen. Our soil is a strong loam resting on clay. *F. Clarke, Lowther Castle Gardens, Penrith.*

— The Apple crop is very light in these gardens. Many trees are quite barren of fruits. Pears on wall trees are very sparse. The weather last year was dull, and the wood did not mature, and cold and wet weather prevailed this year when the trees were in bloom. Strawberry Royal Sovereign always crops well with us, but requires replanting every third year. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

3.—ENGLAND, S.W.

CORNWALL.—Small fruits are plentiful and extremely good in quality. Strawberries have failed for the first time in eight years; cutting winds prevailed when these plants were in flower, and cold rains fell just before the fruits were ripe. Apricots are a splendid crop. In spite of protection, the severe weather of winter, and fierce gales accompanied with hail showers when the trees started into growth, killed some Peach trees and crippled many others. The growth of Apple and Pear trees has greatly improved with the warmer weather. *A. C. Bartlett, Pencarrow Gardens.*

— In March the fruit crops promised well, but the cold, wet weather during the three succeeding months completely ruined the fruits, excepting those of Peach and Nectarine, which are plentiful. These will be later than usual in ripening, but they promise to be of excellent quality. Small fruits are very plentiful. The soil in this district is very light in texture, and dries very quickly, even after long periods of rain. *Alfred S. Read, Port Eliot Gardens, St. Germans.*

— The Apple crop in this district is almost a failure. One farmer informed me that in two orchards he can count but four Apples on all the trees. Pears are also very few in number. The heavy rains spoil quantities of Strawberries. Currants, Gooseberries, and Raspberries are abundant. The soil here is a light, sandy loam. *W. H. Bennett, Menabilly, Par Station.*

DEVONSHIRE.—An abundance of blossom on all fruit trees set well, but the cold, sunless weather, with occasional frosts, thinned the fruits. In favoured positions the trees have heavy crops, but, generally, they are carrying a thin crop. The continued cold weather and heavy rains during April, May, and up to mid-June, have caused to be average what promised to be phenomenally heavy crops. *Andrew Hope, 38, Prospect Park, Exeter.*

— With the exception of small fruits, the fruit crops are a failure in this part of Devon. Continuous fogs at the time the trees were in blossom greatly contributed to the failure. The blossoms were plentiful, and I believe that the deleterious matter in the fogs was the cause of the foliage becoming burned. The leaves of Peach trees are much blistered; Gooseberries and Strawberries are the heaviest crops I have known. The foliage of Black Currant bushes is much blighted, and the fruits are not swelling. *Geo. Baker, Membrand Gardens, Near Plymouth.*

— Almost all kinds of fruit, with the exception of Apples upon Standard trees, are more or less plentiful. Pears are an average crop. Stone fruits are present in quantity, with the exception of Cherries. The trees have made a free growth, and notably those of Apricot, Peach, and Nectarine, while the two last-named are remarkably free from "blister or curl." Strawberries have been a heavy crop, but the early berries decayed somewhat badly. Givons' Late Prolific furnished a late supply of brightly-coloured and highly-flavoured fruits. Strawberries succeed well on our deep, sandy loam, which rests on the old red sandstone. *James Mayne, Bickton Gardens, East Budleigh.*

— Apple and Pear trees promised heavy crops of fruits, but cold winds caused the fruits to drop freely after they were set. Peach, Nectarine, and Apricot trees all set very heavy crops. Strawberries, generally, were good, although many were spoiled by the wet weather. Gooseberries, Black Currants, and Raspberries are all plentiful and of good quality. Red Currants are an average crop. Peaches, Nectarines, Cherries, Red and Black Currants have all been badly affected with aphids, and the foliage and shoots have required frequent sprayings and washings. Our soil is a rich and fairly heavy loam of volcanic origin, and overlying the red sandstone formation. *J. Coutts, Killerton Gardens, Broadclyst.*

— With the exception of Plums, there was an abundance of blossom on all fruit trees, and the promise for heavy crops of fruits was good. Notwithstanding this, the fruit crops are the worst for some years past. About half the flowers on Strawberry plants were "blind," and the fruit that ripened was very indifferent. During July frost was registered on several nights. *T. H. Slade, Poltimore Gardens, Exeter.*

GLoucestershire.—Many Apple trees developed but little blossom, and that which did appear failed in some instances to set, consequently there are few Apples in this district. Pear trees blossomed freely, and we have a good crop of this fruit. Cherries dropped badly after they had set. Plums, Peaches, Nectarines, and Apricots are all plentiful. Gooseberries are a heavy crop, also Red and Black Currants. Superlative Raspberries are carrying excellent crops of good fruits. Strawberries have done well, but some of the berries rotted before they ripened. The soil here is variable; some trees are growing in a sandy, and others in a clayey loam. The subsoil consists of the old red sandstone. *John Banting, Tortworth Gardens, Falfield.*

— Apple and Pear trees blossomed abundantly, but owing to cold winds and blight most of these fruits have dropped. Stone fruits, including Apricots, Cherries, Plums, Peaches, and Nectarines have needed severe thinning. Gooseberries, Currants, and Raspberries are good, and much above the average in quantity. Strawberries have been a good crop, but many of the earlier fruits decayed owing to continued rains. Strawberry Givons' Late Prolific furnished splendid fruits of excellent flavour and high colour. Our soil is a light loam resting on limestone rock. *F. C. Walton, Stanley Park Gardens, Stroud.*

— Apple trees produced an abundance of blossom. Early kinds are above the average in quantity. Late-keeping varieties are scarce. Pears are an average crop. Early kinds are greatly affected by the Pear-midge, though precautions were taken to combat this pest. Many kinds of Plums are plentiful, such as Victoria, Monarch, and Golden Drop, but Greengages are bad. The trees blossomed well, and set their fruits well under the protection of nets, but cold, damp weather and rough winds caused many of the fruits to drop. Of Cherries, Morellos are good, but very late in ripening. The cold season has adversely affected other kinds. Peaches and Nectarines are above the average in quantity, but a plague of wasps and flies has ruined many of the fruits out of doors. Apricots are over the average in number, but later than usual in ripening. All small fruits are good. Strawberries were an abundant crop, and the fruits were of good size, but they lacked flavour. Givons' Late Prolific produced grand crops of fruits. *A. Chapman, Westonbirt Gardens, Tetbury.*

— Although the season has been very cold, the fruit crops generally are satisfactory. Growth was very slow during May and June, and all trees suffered from blight owing to the cold winds and low temperatures. Apples are an average crop. Pears set well after an abundance of bloom, and are satisfactory. Plums are abundant. Peaches, on walls outdoors, are good, although the foliage is still pale in colour from the effect of the cold. Among small fruits Gooseberries are plentiful and good. I have not yet seen the new Gooseberry-mildew. Some of the Red Currant bushes are blighted, but they are carrying plenty of fruits. Black Currants promised well, but many dropped owing to the cold nights. Raspberries are good in every respect. Strawberries have been good, although wanting in colour and flavour. A few rotted, and some were attacked with mildew. The soil here is a strong loam resting on clay. *Alfred E. T. Rogers, Sudeley Castle Gardens, Winchcombe.*

HEREFORDSHIRE.—Apples are much under the average in quantity; varieties of Apples carrying the best crops are (culinary) Bismarck, Bramley's Seedling, Golden Noble, Golden Spire, Hambling's Seedling, Hornead's Pearmain, Newton Wonder, Stirling Castle, Warner's King, and Loddington Pippin; (dessert), Allington Pippin, Adams' Pearmain, Beauty of Bath, Fearn's Pippin, Margil, Ribston Pippin, Rival, and Wealthy. Of Pears, the best on bush trees are Clapp's Favourite, Conference, Emile d'Heyst, Fondante d'Automne, Fondante Thiriot, Marie Benoist, Magnate, President d'Osmonville, and Triomphe de Vienne. Our heaviest crops of Plums are on bush trees, which are much better fruited than wall trees. Small fruits are good, especially Currants. Our best Black Currant is Boskoop Giant. *Thos. S. Goodrich Court Gardens, Ross.*

— Apple orchards were a beautiful sight when the trees were in flower, but, owing to frost and wet weather, Apples are very scarce. Strawberries were fairly plentiful, but nearly all the berries were spoilt by mildew, some varieties being worse in this respect than others. Peach and Nectarine trees that were protected by netting on outside walls have had to have their fruits severely thinned. Our soil is a heavy loam resting on limestone. *George Mullins, Eastnor Castle Gardens, Leebury.*

— All fruit trees appeared remarkably well in the spring-time. The prospects for the Strawberry crop were extra good in May, but the unseasonable weather destroyed most of the berries. Strange to say, runners planted last year fruited the worst of all. Peaches and Nectarines out of doors set extraordinary crops. Some orchards contain a good number of Pears, and scarcely any Apples. The soil is cold and heavy, and rests on a stiff clay. *Thos. Watkins, Newport Hall Gardens, Eardisley, R.S.O.*

(To be concluded.)

The Week's Work.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Gloriosa superba.—These plants having finished flowering, the foliage is beginning to turn yellow. If they are growing in a prominent position and are considered unsightly, they may be taken from the wires and the growths trailed round some stakes, placed in the pots, after which the plants can be removed to a less conspicuous position, but one that is fully exposed to the sunshine. Gradually decrease the supply of water at the roots until the foliage and stems are quite matured, when it should be withheld altogether, and the roots kept in a dry condition throughout the winter in a structure having an atmospheric temperature of not less than 55°.

Caladiums, &c.—As the foliage ripens off, gradually reduce the water supply, but do not permit drought to occur until all the leaves have died quite away. The plants should now be placed in a moderately warm, but well-ventilated house or frame, and when thoroughly ripened off may be stored away for the winter in a warm position quite free from drip. Gloxinias and Achimenes may be treated in the same manner as they approach their resting period.

Begonias.—Most of these being nearly past the decorative stage, they may be removed from the houses and placed out-of-doors for the remainder of the month, or until the plants are cut down by frost. When this has taken place, and the soil is sufficiently dry, shake out the tubers and store them in a cool, dry place free from frost, such as is suitable for the storing of Potatoes.

Cyclamen.—If seed is not already sown, no time should be lost before carrying out this operation, as there is a decided advantage gained over sowing in winter, the plants having a good start if seeds are sown early in September and consequently a longer season to grow in. Thoroughly drain the pots or pans, and fill them with a mixture of light loam, leaf-soil, and plenty of sand. Place them in a warm house, taking care that the soil in the seed-pans never becomes quite dry. To assist in keeping the soil moist without frequent waterings, place some paper over the seed-pots, keeping this slightly damp. Remove the paper when germination has taken place, but shade the tiny seedlings from bright sunshine. Keep the pans on a shelf near the glass in an intermediate temperature, and pot the seedlings singly into small pots when they have become large enough to be handled. The plants should be encouraged to grow slowly all through the winter.

Schizanthus.—Seeds of *Schizanthus* should also be sown, and the pans placed in a cool frame on a damp base. Use light, sandy soil, and when grown large enough to be handled, prick out the young plants into pans or boxes. Keep them well up to the glass and ventilate the structure freely. Re-pot the plants as soon as they require more root-room, not allowing them to become pot-bound until they are in the pots in which they will flower. Keep them during the winter in a cool frame, *Schizanthus* being very impatient of heat.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Bedding Calceolarias.—In the West of England cuttings of these plants are rarely inserted before the end of September, but in less favoured parts it is now time to commence the work. The simplest method for their propagation is to prepare a frame, the bottom of which should be filled with porous material to ensure suitable drainage. The soil should consist of a mixture of three parts loam to one of leaf-soil, with the addition of plenty of coarse sand, and the whole should be passed through a sieve having a ½-inch mesh. Make the soil firm and spread a thin layer of silver sand over the surface. The cuttings should be short-jointed and without flower-buds; plant them firmly at a distance of 2 inches apart. Apply water copiously with a fine rose can, and keep the lights closed, except for half an hour each day, when they should be slightly tilted at the back to allow any superfluous moisture to escape. Shade the cuttings from bright sunshine, and when they are rooted admit air freely to harden them.

Watering.—The weather this summer has been moist and dull, but no great quantity of rain has fallen, consequently precautions must be taken to see that bedding plants do not suffer during dry, sunny weather. Such plants as *Lobelia cardinalis*, *Salvias*, *Nicotianas*, *Pansies*, *Violas*, and *Rudbeckias* will be found to suffer more from this cause than *Pelargoniums*, *Heliotropes*, &c. In these gardens, the soil is of a light texture, and *Cannas* need frequent waterings during even moderately dry weather to induce them to flower continuously; each watering is preceded by a light dressing of guano.

Bulbous Irises.—September is the best month in which to plant these Irises. If they are placed in different aspects in the garden, and a judicious selection be made of the best varieties of both the Spanish and the English types—the latter is a fortnight or more later in flowering than the former—a display of these flowers may be had for about five weeks. The best rooting-medium for both types is a light, rich soil that has been deeply worked. A general mistake is made in planting these Irises too thinly; a group of a dozen or more bulbs, planted at 6 inches apart, produces a much better effect than the same number scattered thinly along a border. *I. pavonia* (Moræa), the Peacock Iris, and *I. tuberosa*, the Snake's Head Iris, are also desirable species for planting; they should be given the same treatment as that described above. *I. reticulata* is one of the best garden species.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Masdevallias.—The proper seasons for repotting *Masdevallias* is at the beginning of September, and in February. September is generally considered the better time, because it is in autumn the plants make the greatest number of roots, and the cool, moist weather generally prevalent at this season is also favourable to the plants becoming quickly re-established. It is not advisable to repot any plant if it has already sufficient root-room and the compost is in good condition; neither should healthy specimens be disturbed unnecessarily that are needed for exhibition purposes next season, as they may fail to bloom satisfactorily the first year after repotting. But in some instances the compost may have become sour and stagnant, and this can easily be picked out down to the drainage and fresh soil substituted without causing much disturbance to the roots. Plants which have lost a number of leaves and become bare in the centre may now be safely divided and be potted separately for propagating purposes, or they may be remade up into neat, compact specimens. They will thrive equally well if treated either way. Select pots of suitable dimensions, bearing in mind that all the strong-growing *Masdevallias*, as *M. Veitchiana*, *M. ignea*, *M. Lindenii*, *M. macrura*, *M. coriacea*, *M. coccinea* and its numerous varieties (of which *M. c. Harryana* is an excellent example) are vigorous rooting plants, and requiring considerable space. Fill the pots to about one-half of their depth with broken crocks, and employ a compost of good, fibrous peat, polypodium fibre, and sphagnum-moss, mixing them in equal proportions, to which may be added a sprinkling of small crocks and coarse

silver sand. Cut up the materials roughly, mixing them well together, and make the compost moderately firm about the roots, especially towards the centre of the plant, for, unless this is done properly, the soil in that portion will decay more rapidly than that which is nearer to the sides of the pot. Carefully work the compost between the roots, keeping the base of the plant on a level, or just a little below the rim of the pot. When the operation is completed, prick in a few heads of living sphagnum-moss over the surface. This is a much better plan than covering the whole surface of the compost with a layer of chopped moss.

Dwarf-growing varieties.—*M. Wageneriana*, *M. Estradae*, *M. Shuttleworthii*, *M. Arminii*, *M. ludibunda*, *M. picturata*, *M. melanopus*, *M. ionocharis*, *M. hieroglyphica*, *M. O'Brieniana*, &c., form attractive objects when well flowered. Any of similar growth to those just enumerated should be grown in shallow pans, which may be suspended close to the roof glass, or they may be placed altogether upon an elevated position upon the stage. The critical time with *Masdevallias* is just after they have suffered root disturbance, it being an easy matter to afford an excess of water, which often results in the loss of many roots and leaves; therefore, to be on the safe side, it is advisable for the first few weeks to water very sparingly, giving just sufficient to induce the sphagnum-moss to grow, and as each plant becomes re-established, gradually increase the supply. After repotting, shade the plants from all sunshine and maintain a moderately moist atmosphere by damping the surfaces, in the house two or three times each day, but modifying this practice according to the locality and the construction and situation of the house. To avoid black and spotted leaves, also to prevent the spread of a fungus which attacks the leaves of *Masdevallias*, care should be taken to prevent an excess of atmospheric moisture during dull weather. When the temperature of the external atmosphere is falling below 50°, gradually reduce the amount of moisture inside, and where possible have the hot-water pipes made just luke-warm. Where no separate house is set apart for these plants, a warm, sheltered corner of the Odontoglossum house is the next best place for them. Keep all flowers picked off during the next three or four months, so that the plants will bloom the more freely in their proper seasons. The white *M. tovarensis* should not be repotted now unless a plant is in bad condition at the root.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Street trees.—The planting of trees and their maintenance in the streets of towns and cities usually devolves upon the public works department, while the actual work involved is invariably carried out by the staff of the parks department where such exists. Thus, with the exception of deciding when and where trees are to be placed, street planting is to all intents and purposes a branch of park work. As the primary success in growing street trees largely depends upon planting them early in the autumn, it is well to have all the necessary preparations made before the planting season begins. The numbers of trees required, the kinds most suitable for the locality, and the selection of the trees themselves where possible, are all matters which should be seen to before the autumn. Tradesmen generally do not care for trees in front of their premises, hence it is inadvisable to attempt to beautify the business part of a town with trees, unless the streets are exceptionally wide. On the contrary, in the residential quarters most people are very anxious to have trees planted in front of their dwellings, and it becomes necessary to make certain restrictions to prevent this work from being overdone and from becoming a very expensive form of luxury. In this city trees are never planted in streets that are less than 45 feet in width, a rule which prevents a very large number of thoroughfares from being planted, much to the regret of their inhabitants. As trees are liable to suffer injury from many causes when growing in a public thoroughfare, it is inadvisable to plant either rare or expensive kinds. We make it a rule never to plant a tree costing more than 3s. 6d., in a public street, unless under the most exceptional circumstances.

Suitable trees for planting in streets.—The choice of trees suitable for town planting is an important matter, and has much to do with the failure or success of the undertaking. Soil, position, and local conditions are the more important factors in determining the selection of suitable trees. In most English towns few trees are more adapted for street planting than the Oriental Plane, which is capable of withstanding much of the ill usage incident to the life of a town tree. The Sycamore, Norway Maple, Turkey and Scarlet Oaks, fastigiate Poplars, Beech, Ailanthus, the ordinary Robinia, and the smaller-growing forms of the Elm are all useful trees for street-planting. Unfortunately many highly-ornamental and easily-grown trees are unsuited for this purpose on account of their bearing either showy flowers or prominent fruits. The Horse Chestnut is a beautiful object in a public street, but on account of its fruits it is not desirable to grow it near houses, for boys will persist in throwing stones to bring down the nuts in the autumn. The Mountain Ash and several other members of the genus *Pyrus* are ideal town trees, but children destroy them as soon as the fruits begin to colour. If our town children were taught, like those on the Continent, not to interfere with street trees, what great possibilities of beautifying many of the most sombre-looking parts of a town would city gardeners possess!

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq.,
Norwood, Alloo, Clackmannanshire.

Pineapples.—A dry atmosphere should be maintained in houses in which these fruits are ripening, and ventilation should be freely afforded during the daytime; allowing the top ventilator to remain open also a trifle at night. The temperature should range from 70° to 80° Fahr. Keep the plants dry at their roots, for if water is applied to the soil at the time the fruits are changing colour, decay will ensue in the centre of the crowns. If these directions are followed, Pineapples may be kept in a satisfactory condition for some considerable time after they are ripe. Plants of Pineapples intended for fruiting next spring will now require careful treatment, and no greater quantity of water should be afforded them than is necessary to prevent the foliage from flagging. Maintain a warm, humid atmosphere in the pits, and admit fresh air daily during hot weather. Gradually lower the temperature as the days shorten, and close the ventilators early in the afternoon so as to conserve the sun's heat. Suckers should now be detached from the parent plants, and be potted in turfy loam, using pots with a diameter of 6 inches for the purpose. Pot firmly, and plunge the roots in a bottom heat of 80°; the atmospheric temperature in the pit should be 70°. Keep the atmosphere humid and afford the plants a copious watering with lukewarm water, which will suffice until the suckers form roots. Sprinkle the plants lightly overhead both morning and afternoon.

Melons.—Plants bearing ripening fruits will require a free circulation of air about them by day, and a little from the roof-ventilators at night-time. This admission of air is necessary in order to prevent the fruits from splitting. Both the night and the day temperatures of the Melon-pit should range from 70° to 80°; maintain a dry atmosphere constantly and be careful not to apply much water to the roots. By discontinuing the bottom heat and maintaining a cooler and drier atmosphere, the supply of fruits will be available for a longer period than otherwise. Mulch the borders with horse-litter. Late-planted Melons that are swelling their fruits require to have a moist atmosphere about them, with a day temperature of 85° and 75° at night. The damping should be done regularly, and the plants watered with the greatest care. Occasional doses of liquid manure will be beneficial. Secure the fruits to the trellis-work; pinch the ends of young growths, but leave a few shoots unstopped, until the fruits are almost ripe, in order to encourage a free root-action.

Orchard-house trees.—Pot-trees of such fruits as Apples and Pears should never be allowed to suffer from want of water at their roots, and flagging of the leaves must be studiously avoided. Any fruits that are ripe should be gathered and placed in the fruit room. Foliage shading the fruits from the sun's rays should be entirely removed, or arranged at the back.

Feeding should be discontinued as soon as the colouring of the fruit commences. Allow the trees to receive the full benefit of night dews, for the dew at night and the sun's rays by day are essential to the best maturation and colouring of Apples.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bicton,
East Devon.

Trained fruit trees.—If the lateral growths were pinched early in the season, secondary shoots will have formed, and these should now be stopped at the first leaf: this practice will favour the formation of fruit-buds at the base of the current season's shoots. A crowded condition of the lateral growths must be avoided, in order that the wood which should produce fruits next season may become well ripened: the hanging fruits will also benefit by the removal of superfluous shoots. The present is a suitable time to observe gross-growing trees that they may be marked for root-pruning towards the end of October and early in November. Frequently hose or syringe the foliage of trees trained against warm walls, for red spider is much easier kept away than eradicated when present. Aphids, too, will sometimes appear on Peach and Nectarine trees when syringing is discontinued while the fruits are ripening. Immediately the crop has been cleared, wash the trees with quassia-extract, and direct the syringe to the underneath side of the leaves, this position being a favourable lurking-place for insect life. In some gardens blackbirds and thrushes devour ripening Peaches, and crops of Figs are often entirely ruined by these birds unless netting is used to keep them at bay. Expose late ripening Peaches to the full rays of the sun by placing the foliage aside; part of a leaf may be cut away if it is unduly shading a fruit. Examine each day the traps set to catch earwigs, and destroy any that are caught by blowing them into a pail that is half filled with hot water.

Packing Peaches and Figs.—Both these fruits require very careful gathering and packing if they are intended for transit. Peaches should be first enclosed in tissue paper, twisted at the top with 2 inches to spare, so that the fruit can be easily taken out of the box. Next a piece of cotton wool of treble thickness should be wound around each, and afterwards they should be placed closely together in shallow boxes, or, if wood-wool be preferred, this may be put next the paper. Whatever material is used, all intervening spaces must be filled and the whole made moderately firm about each fruit, the base of which should rest on an inch layer of soft material, such as advocated above. Figs should either be wrapped in Spinach or soft Bean leaves, and be placed thickly together in quite shallow boxes prepared as for Peaches, with a layer of tissue paper over the fruits. The remaining space should be filled with a similar material as that used for the base. In packing Peaches, Nectarines, and Figs, only one layer of fruits should be placed in a box.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq.,
Cobham Park, Surrey.

Formation of Mushroom-beds.—A start should now be made to collect droppings from the stables for the purpose of forming mushroom-beds, collecting sufficient for making each bed in as short a space of time as possible. In the meantime, keep the collected droppings on a dry base in an open shed, and turn them over every morning until the required quantity has been obtained. When the beds are being formed, care should be taken to make them thoroughly firm by treading the droppings together, or if this cannot be done owing to the position of the bed, then by beating with a wooden mallet. After a few days the heat of the bed will commence to increase, and after a further lapse of time it will decrease. When the decrease has set in, and the temperature is at about 80°, the spawn may be inserted, first breaking it into pieces of about 2 or 3 inches square, and placing these pieces at about 2 inches deep in the bed. At the time of spawning, the atmospheric temperature of the house should range between 60° and 65°. When the bed has been spawned for one week add a thin layer of fine soil to the surface, applying it in a moist condition, and making it firm by

beating it with the back of a spade. Keep the atmosphere of the house moist and of even temperature until the first Mushrooms are ready for cutting, when a temperature of 55° will be quite high enough. The frequency at which fresh beds are made must depend upon the accommodation there exists and the demand needing to be satisfied. During the period the droppings are being collected give the house a thorough cleaning, and limewash all the walls, &c., renovating any planks that are faulty, and putting the whole of the interior of the house in good working order for the season.

Hoeing.—Continue to hoe at frequent intervals the surface soil between all winter crops. The season of growth is now becoming very short, therefore afford every assistance possible to the various crops, so that they may become properly matured, and be therefore the better able to withstand severe weather in winter. By freely using the hoe both between the crops and on vacant plots at this season, before the weeds have ripened seed, much labour will be saved next season.

Early Brussels Sprouts.—A few of the old leaves at the base of the plants should be taken off to allow a free circulation of air and light among the crop, particularly where much growth has been made and the leaves are now thick together. If this work is neglected the young Sprouts will become drawn, weakly, and loose.

Celery.—Attend to the earthing-up of this crop, doing the necessary work at the first favourable opportunity; but never, on any account, carry out such an operation when the leaves or stems are approaching a damp or moist condition, or decay of the crown will take place.

Turnips.—Late Turnips have been more satisfactory than for several seasons past. The seeds have germinated well, and the young plants have grown quickly, and consequently are unusually free from the infestations of "fly." The crops will, in most cases, require thinning, and this work should be done as early as possible to prevent the young plants from becoming overcrowded.

THE APIARY.

By CHLOVIS.

A word in season.—Those who are fortunate enough will now be counting up their gains, but most beekeepers will be filled with disappointment because of their losses. From all parts of the kingdom there were complaints about the complete loss of stocks in 1904 and 1905, but the losses of 1908 will be even greater than those if the bees are not given food at once. It is surprising how little has been stored in the brood-chamber this year, and how very weak the stock are.

How to make Syrup.—We must feed at once, in order that the bees may have a good supply of food next March and April, and also to encourage the queen to lay a large quantity of eggs that there may be a good cluster of bees to keep up the necessary heat of the colony in the coming winter. A strong colony always winters better and more economically than a weak one. Take about 8 lb. of white sugar and boil it well in 4 pints of water, taking care that it does not burn, and, when cool, place the syrup in jam bottles and cover with muslin. Take care to fill the bottles to the brim, because, if any air is left in the pots the syrup will be forced out by it; this will flood the floor board, and robbing with all its attendant troubles will commence.

How to put on the Syrup.—Cut a hole in the quilts, about 2 inches square, on three sides, and turn back the flap; over the hole place a piece of wood, 6 inches square and $\frac{1}{2}$ inch thick, having a hole in the centre about 1 $\frac{1}{2}$ inches in diameter. This stand will raise the bottle above the frames and give the bees freer access to the syrup. Overturn the bottle on the wood, so that the mouth of the bottle will be over the hole in the wooden stand.

A warning.—Robbing is not only caused by letting the syrup run on the floor board, but also by spilling the syrup near the hives, and by putting on the food during the day. Evening is the more suitable time to perform the operation. When feeding take care to wrap the bottle of syrup up warmly to conserve the heat, for bees prefer the liquid lukewarm. Many beekeepers are very careless in this respect, and the interior of the hive is very draughty.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, SEPTEMBER 7—

Pollockshaws Fl. Sh.
Soc. Franc. d'Hort. de Londres meet.
German Gard. Soc. meet.

TUESDAY, SEPTEMBER 10—

Scottish Hort. Assoc. meet.
Dahlia Sh. in Manchester Botanic Gardens 2 days).

WEDNESDAY, SEPTEMBER 11—

Roy. Caledonian Hort. Soc. Sh. at Edinburgh (2 days).

THURSDAY, SEPTEMBER 12—

London Dahlia Union's Sh. in Botanic Gdns., Regent's Park (2 days).

FRIDAY, SEPTEMBER 13—Hamilton Fl. Sh.

SATURDAY, SEPTEMBER 14—Newton Mearns Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—55.1°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 4 (6 P.M.): Max. 60°; Min. 46°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 5 (10 A.M.): Bar., 29.8; Temp., 65; Weather—Overcast.

PROVINCES.—Wednesday, September 4 (6 P.M.): Max. 61°; Ireland, S.W. coast; Min. 48°; Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—

Sale of Dutch Bulbs, &c., at Stevens' Rooms, King Street, Covent Garden, W.C.

MONDAY TO FRIDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—

Twenty-second Annual Unreserved Trade Sale of Pot Plants, at Dyson's Lane Nurseries, Upper Edmonton, by order of Messrs. H. B. May & Sons, by Protheroe & Morris, at 11.

TUESDAY—

Annual Trade Sale of winter-blooming Heaths, &c., at Burnt Ash Road Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris, at 11.

WEDNESDAY—

Great Annual Trade Sale of winter-flowering and other Plants, at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.
Lilium Harrisii, Roman Hyacinths and other bulbs, Palm seeds, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—

Twenty-sixth Annual Trade Sale of winter-flowering Heaths, &c., at The Longlands Nursery, Sidcup, S.E., by order of Messrs. H. Evans & Sons, by Protheroe & Morris, at 11.

FRIDAY—

Choice importations of Odontoglossum crispum, Cattleyas, Gigas, Mendelii, &c., also established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12-45.

tributed all over the country who have noted each year the dates of flowering of certain specified plants, the dates on which certain migratory birds were first seen or that when the note of other birds was first heard, and the first appearance of certain common insects. The observations are sent to him and are grouped under eleven large districts into which the British Isles have been divided for the purpose, and for each district and for each subject of observation he has obtained a series of mean dates which may be regarded as characteristic of an average phenological year. The deviation of the dates in a given year and district from the average enables the reader, therefore, to get a fairly good idea of the character of the season in that part of the kingdom, and to appreciate what has been the cumulative effect of the various elements of climate upon vegetable life and upon those forms of animal life with which the gardener is chiefly concerned. The Report before us was prepared for the Royal Meteorological Society, and it contains the results of Mr. Mawley's analysis of the observations for the agricultural year extending from December, 1905, to November, 1906, and supplies much interesting information, for which the Report itself should be consulted by those who are interested in the subject. But, in addition to the purely phenological results, it gives a good general summary of the most noteworthy features of each of the four seasons, which should enable horticulturists and agriculturists to better understand some points connected with their work which may perhaps have been a little puzzling to some of them. Mr. Mawley mentions as the most noteworthy features of the weather in 1906 which affected vegetation, the dry period which lasted from the beginning of June until the end of September, and the great heat and dryness of the air at the close of August and the beginning of September. He points out that, whilst wild plants came into flower earlier than usual until the middle of April, those which flowered after that date were later than usual. A remarkable result of the unusual weather last autumn was the very long time the trees retained their foliage without assuming any change of colour.

Potato Trials.

We have already referred to the trials of tuber-producing species of Potatoes by Messrs. Sutton and Sons, at Reading, during the passing season. But so far these tests have been furnished by pot plants grown under glass. It is therefore interesting to find that practically all the species have also been grown in the open ground at the Southcote trial grounds, and with results very much the same as were furnished by the house-grown plants. Several species seem to be much too delicate to thrive out of doors in such a season as we have experienced this year. Some others show admirable qualities, and none more so than *S. etuberosum*, of which there is growing a good breadth, the plants having spreading tops, full of bloom, and leafage of a somewhat glossy nature. It was interesting to note, on a recent visit, that, whilst there was not an ordinary commercial variety, however strong, but showed some evidence of diseased leafage, not a speck or spot could be found on the leafage of *S.*

etuberosum. That fact naturally leads to the hope that this species may yet become the parent of a disease-resisting race of Potatoes. Messrs. Sutton's anticipations that, because seedling plants from it show a certain amount of diversity, this species may have been the originator of all the varieties now in commerce is supported by the fact that the seedlings show material approach to the culinary Potatoes. It has, however, to be mentioned that, ever since its introduction to this country, *S. etuberosum* seems to have retained its specific form. Apart from certain seedling progeny, the stock plants of the species growing at Reading remain pure to specific character. Contrary to the habit of commercial varieties that have been propagated year after year from tubers, there are among the seedling Potato plants raised this year from commercial varieties crossed with each other, some that show not merely extraordinary growth, but also abundant flowers of remarkable size and colour. A breadth of the yellow-flowered selection from the bluish-flowered Up-to-Date now shows adherence to that character, although last year some plants reverted to the normal colour. The yellow tint is due to the interesting fact that petals have in the flowers become partially changed into stamens, hence the singular colour presented in the flowers of this selection of Up-to-Date.

The trial of Commersoni violet (*Labergerie*) and Blue Giant (*Paulsen*) out in the open is an extensive one, running into some 20 rods area. There is a large breadth of each variety, and they appear to have identical features. Both stocks being imported show very robust growth. There are also breadths of both raised from tubers grown at Southcote last year, the plant growth upon these latter being much less robust.

But test roots lifted from all the stocks showed that the best tuber-produce is obtained from plants of medium growth and from locally-grown sets. Gross tops do not always mean that there is a good crop of tubers.

Some locality tests as made last year were repeated. Scotch, Irish, Lincoln, and Berkshire seed tubers were planted of several varieties. There was very little difference in the crops raised from tubers obtained from Scotland and Ireland, both giving much better results than did either the Lincoln or Berkshire tubers. The testing of immature or unripe seed-tubers against others of the same stock left to fully mature in the ground has constantly shown that the immature tubers are most productive. Four varieties were thus tested in the present trial, and in each case the results agreed with those obtained at previous trials. It was found also that tubers lifted on July 18th proved to be more productive than those lifted also to be unripe on August 1st. That point would, however, have to be governed by the character of the variety, the position, where grown, and the general character of the season.

In order to check scab disease in the tubers, rows of Potatoes were, at the time of planting, dressed with sawdust, with which was mixed a small quantity of salt. So far as present appearances can be relied upon, the result has been a success, for such tubers as were lifted were very clean, whilst from other rows

The word "phenology" is not one with which many people are familiar, and since we have turned to a good many dictionaries for enlightenment as to its meaning, but without finding any, we are not surprised at the fact. The author of the report has defined the word elsewhere as "the science of appearances . . . it deals with the first appearance each year of certain wild flowers, birds, and insects"; and we might amplify this definition by saying that the function of phenology is to show the character of a season by exhibiting its effect upon the growth of plants, the migration of birds, the prevalence of insects, &c. For many years Mr. Mawley has directed the work of a large number of observers dis-

* Report on the Phenological Observations for 1906, by Edward Mawley, F.R.Met.Soc., V.M.H. (Quarterly Journal of the Royal Meteorological Society).

SENECIO WILSONIANUS, A SPECIES FROM WESTERN CHINA. FLOWERS YELLOW.

not so treated scab was plentiful. The experiment may, if good follows, have great value for Potato growers. Other rows treated with a proprietary substance not unlike tar has so far shown no good results.

The tests or experiments that have been conducted at Southcote this year are of a very modest character as compared with the elaborate series conducted last year, but, such as they are, they afford results that are of value to all Potato growers. It has not been shown at present that any gain is to be obtained from the *Solanum* species that Messrs. Sutton are cultivating, but at least they are interesting, and they are certainly capable of affording valuable information and material to botanists. It is, however, to the improvement of the Potato of commerce that practical men look forward, and especially so at the present time when we are said to be threatened with a tuber crop some 30 per cent. below the average.

RESEARCHES AT CAMBRIDGE.—The second part of Volume II. of the *Journal of Agricultural Science** is a record of some of the valuable work now being carried on at Cambridge. In the papers here printed we see, as it were, the fighting line of modern scientific investigators steadily making their way into the unknown, wrestling with and gradually overcoming by skilful experiments and patient research the obscure problems which exist in the vegetable world. It is noteworthy that all the papers here given, while examples of pure research and untrammelled by commercial connection or control, have yet a direct bearing on practical economic problems. Four out of the seven papers deal with Genetics—the new name for the old problems of heredity, variation, and descent—in a word, the science of breeding. Mr. BIFFEN contributes two important papers on cereals. In the first he continues his *Studies in the Inheritance of Disease Resistance*, and confirms and elaborates his previous interesting discovery that (1) liability, and (2) immunity to "rust" form an allomorphic pair of unit-characters in Wheat plants. That is to say, when a strain of Wheat, very susceptible to attacks of rust, is crossed with another strain which is known to be immune (or nearly so), the resulting hybrids are found to be, without exception, susceptible. But in the next generation raised from these hybrids, it is found that about one-fourth of the plants are immune (like the original immune parent), and the other three-fourths inherit the liability to disease. In the succeeding generations the immune plants retain their purity, while those liable to disease give off in each successive generation fixed proportions of pure susceptible, impure susceptible, and pure immune forms, in accordance with the Mendelian laws. Unfortunately, the type of Wheat which is valued for its resistance to parasitic disease is practically worthless in other respects; but Mr. BIFFEN's experiments show that by making suitable crosses and growing sufficiently large cultures it will be possible to raise a breed in which the valuable "immunity" of the otherwise worthless Einkorn Wheat is combined with characters from other varieties which (except for their liability to disease) are regarded by farmers as of first-class quality. Mr. BIFFEN's other paper gives the results of his hybridisation experiments with a number of varieties of Barley. Many pairs of characters are shown to follow Mendel's laws, while in other cases complications and deviations arise which call for further research. Miss D. C. E. MARRYAT supplements

Cambridge Press, 5s. net.

Mr. BIFFEN's work on Wheat by an investigation into the minute details of the relation between the parasitic rust fungus and the infected Wheat plant. She confirms the view of former investigators that immunity is quite independent of any structural character, such as thickness of cell-walls or size and number of stomata, and concludes that immunity to disease depends upon the presence or absence of mutually destructive toxins and antitoxins. Miss MARRYAT's paper is illustrated with figures showing the germination of the rust spore and its growth and destructive action upon the cells of a "susceptible" Wheat, while other figures exhibit the death and disintegration of the fungus when invading an "immune" variety. Another important paper is that of Mr. T. B. WOOD's on the *Chemistry of Strength of Wheat Flour*, in which an attempt is made to correlate the qualities recognised by millers and bakers with the ascertainable chemical and physical characters of the Flour. This is an exceedingly complicated problem, and one which is in urgent need of further investigation. In the same number of the journal is a paper dealing with the soils of Cambridgeshire from a farmer's point of view in relation to the underlying geological formations, by Mr. F. W. FOREMAN, and one on "Losses in Making and Storing Farmyard Manure," by Mr. T. B. WOOD, who compares the results obtained from cake-fed heifers and those fed only on roots and hay. There is also a note by Mr. W. L. BALLS, of the Botanical Laboratory, Cairo, on "Mendelian Heredity in Cotton."

INSECTS AFFECTING FRUIT TREES.—A pamphlet of 36 pages, by Dr. C. J. S. BETHUNE, Professor of Entomology at the Ontario Agricultural College, has been issued by the Ontario Department of Agriculture. It treats only of those species of insects which are most commonly met with, and that are sufficiently abundant to cause serious trouble to the fruit-grower. Particular attention is called to the uselessness of employing measures of destruction or prevention, yet allowing wild trees and bushes affording hiding and breeding places for the particular insects to grow without molestation, mention being made of the wild Cherry, wild Plum, Hawthorn, and Mountain Ash. None such should be allowed to exist near an orchard or fruit garden. The pamphlet contains illustrated chapters on some of the fruit-tree pests only too well known in Britain, as the Codlin moth, eye-spotted bud-moth, leaf-roller moth, Apple aphid, woolly aphid, oyster-shell bark louse, Pear tree Psylla, shot-hole borer or fruit-tree bark beetle, Pear tree slug, Plum curculio, Peach scale, Phylloxera of Grape vine, and several insects peculiar to the North American continent. A brief list of insecticides is given, together with the most approved methods of application.

"THE AMERICAN FLORIST."—Our American contemporary, known by the above title, issued its one thousandth number on August 3. Since the first issue, which appeared on August 15, 1885, it has recorded the remarkable growth of the cut-flower trade, and the wonderful changes and development in methods that have taken place in American horticulture. It has always taken a prominent part in assisting in the development of the horticultural industry. We congratulate our contemporary on its success, and wish it continued prosperity, and a long career of usefulness.

AN ANCIENT FLORIST'S BUSINESS.—We note that M. JACQUES ROLLAND, Nîmes, France, states in a contemporary that his seed business has been continued uninterruptedly since 1680, or 227 years, and he adds: "I should be very glad to know if I can count my business to be the oldest establishment in the seed trade."

STUDY OF ACCLIMATISATION IN AMERICA.

We have received from Mr. LEONARD BARRON, secretary, a preliminary programme of the proceedings that will take place at the International Conference on Plant Hardiness and Acclimatisation to be held on October 1, 2 and 3, 1907, in the rooms of the American Institute and in the Museum Building of the New York Botanical Garden. The conference, it will be remembered, will be held under the auspices of the Horticultural Society of New York. The following incomplete list of papers which have been promised will serve to indicate the general scope of the subjects that the conference will cover, and the committee of arrangements will be glad to receive promises of other papers or suggestions. It is purposed to publish in one volume a complete report of the proceedings:—
 "The Determining Factors in the Seasonable Activity of Plants," by D. T. MACDOUGAL, Tucson, Ariz.; "Factors that Control Acclimatisation," by HENRY C. COWLES, University of Chicago, Ill.; "Evaporation as a Climatic Factor Influencing Vegetation," by B. L. LIVINGSTON, Tucson, Ariz.; "Air Drainage as Affecting Hardiness of Plants," by ERNST A. BESSEY, Subtropical Laboratory, Miami, Fla.; "The Real Factors in Acclimatisation," by FREDERIC E. CLEMENTS, University of Nebraska; "Plant Improvements Needed in Specific Cases," by W. M. HAYS, Assistant Secretary of Agriculture; "Comparative Hardiness of Plants of the same Variety from Northern and Southern Points," by J. C. WHITTEN, Missouri; "Observations on Eucalyptus Hybrids; the Japanese Loquat in Algeria; Truth to Seed of Eastern and African Varieties of *Vitis vinifera*," by M. ROBERT, Algeria; "Temperate Zone Plants in the Tropics," by D. W. MAY, Porto Rico; "Acclimatisation of Economic and other Plants in the West Indies," by Sir DANIEL MORRIS, Imperial Department of Agriculture for the West Indies; "Co-operative Testing to Ascertain Hardiness in Fruits," by H. L. HUTT, Guelph, Canada; "Resistance to Cold, Heat, Wet, Drought, Soil, &c., in Grapes," by T. V. MUNSON, Texas; "Developing Hardy Fruits for the North Mississippi Valley," by SAMUEL B. GREEN, Ohio; "Hardiness of the Peach," by U. P. HEDRICK, Geneva, N.Y.; "Hardiness of Apples," by O. M. MORRIS, Oklahoma; "Fruits and Trees in the North-West," by W. S. THORNER, Washington; "Hardiness and Acclimatisation of Alfalfa," by B. C. BUFFUM, Wyoming; "Some Work with Timothy and Awnless Brome Grasses," by S. FRASER, Genesee, N.Y.; "Hardiness of Ornamental Plants in the Middle North-West," by ANTHONY U. MORRELL, Minnesota; "Studies on the Acclimatisation of Plants in the Prairie Regions," by L. H. PAMMEL, Iowa; "Observations in the Region at the Head of Lake Michigan," by JENS JENSEN, Chicago, Ill.; "Experiments in Plant Acclimatisation in Alaska," by WALKER H. EVANS, U.S. Department of Agriculture; "Fifteen Years' Experience in Southern California," by D. F. FRANCESCHI, Santa Barbara, Cal.; "Some Experiences with Field Crops in Virginia," by ANDREW J. SOULE, Blacksburg, Va.; "Observations on Hardiness of Plants Cultivated at the New York Botanical Garden," by GEO. V. NASH, New York Botanical Garden; "Some Anomalous Observations in St. Louis," by W. TRELEASE, Missouri Botanical Garden, St. Louis, Mo.; and "Problems of Hawaii," by J. E. HIGGINS, Hawaii. Promises of co-operation have also been received, writes the secretary, from Messrs. W. ROBINSON, J. BACKHOUSE, and the ROYAL AGRICULTURAL SOCIETY, of England; M. PH. DE VIMORIN, of France; Mr. W. SAUNDERS, Canada, &c.

APPLES SAID TO BE PROOF AGAINST AMERICAN BLIGHT.—An exchange of experiences and opinions in regard to varieties of Apples and Apple stocks that have been thought to be immune from attack from the American aphid or blight (*Schizoneura lanigera*), was recently published in *Möller's Deutsche Gärtner-Zeitung*. Taking a survey of the whole, there are eleven gardeners and nurserymen and the Biological Institute at Dahlem taking part in the discussion, and there appears to be one or two varieties of Apples which are said to be proof against this pest in certain specified localities. Bismarck, Charlomowsky, the Aluten, which is good for the first graft or bud; Gruner Fürstenapfel, Reinette de Canada, Flamed Cardinal, Sheep's Nose (an old Devonshire variety), Grey Autumn Reinette, and Golden Pearmain are said to be infested when trees of White Winter Calville, Great Cassel Reinette, and other soft-fruited varieties are grown in their neighbourhood. Some gardeners state that Emperor Alexander, Striped Beefin, and Northern Spy are immune; whilst others say that these varieties are those that are the worst infested with them. We may therefore assume that no variety is proof against attack. We are not surprised that one correspondent, after years of fruitless endeavour to get rid of the pest, finds the best results to follow good cultivation of the trees, by affording as much organic and inorganic manure as may be adjudged necessary, more especially nitrate of soda, superphosphate of lime and potash, and painting the stems and lower limbs with limewash in the autumn after the leaf has fallen and in the spring before the buds open. The Dahlem authorities lay great stress upon cleaning off the rough bark, and the brushing out of all hiding places, angles, crevices, and washing with tobacco-water. For the destruction of the aphid on the roots, soap suds containing soda is a good means, applying the liquid twice or thrice during the winter.

ONTARIO VEGETABLE GROWERS' ASSOCIATION, 1906.—The second annual report of this association, published by the Ontario Department of Agriculture, affords the reader a good idea of the state of vegetable cultivation in this province. What crops succeed in the various descriptions of soils, how they are best grown, the manures that are found most beneficial, the insect and fungus pests that infest crops, with the methods found suitable for their destruction or prevention, how to get crops to market, summer and winter cultural conditions, and much more that is useful to the man who elects to make this part of Canada his home. The greater part of the information is given in the form of questions and answers.

ELEMENTARY BOTANY: STUDIES IN PLANT LIFE.—J. ADAMS, M.A., Professor Royal College of Science (Ireland), School and College Series, published by FALLON & Co., LTD., Dublin and Belfast. We are sometimes asked for a simple book on elementary botany, one that is simple enough to be thoroughly understood by a student who is not yet familiar with the scientific terms employed in the science. The author of this little work carefully avoids using more of these terms than he can help, and speaks in popular language to make the subject intelligible to all. Considering that there are more than 16,000 technical terms employed in the science of botany, those may welcome this book who feel that such terms make the pursuit of botany as a hobby a difficult and uninteresting task. It may be pointed out, however, that the serious student is bound, sooner or later, to acquire a knowledge of strictly botanical language. The author has divided the subject into single chapters, of which each one may be studied separately. The book is well illustrated with

over 350 figures. Two chapters are added to the general work, one of which deals with plant habitats and the other with poisonous plants. This little book is well suited for use in schools and especially for the teaching of Nature study.

GERBERA JAMESONI.—Mr. R. ADNET, of Antibes, writing in the *Revue Horticole*, describes his experience with *Gerbera Jamesonii*, and shows that like other composites it is likely to afford interesting variations in the form and colouring of the blooms. The red colour already varies from the deepest orange to pure scarlet; also a beginning in the doubling of the florets has been noted. The plant requires much nutri-

ment of excess of moisture. Under suitable cultivation they flower when about five months old. The plant is employed in the south of France for filling groups and beds, and for furnishing blooms for cutting. The florists are hoping to obtain a dwarf, compact-habited race, with a less tender constitution and greater vigour in growth than the type. The variations in the colour of the flowers has been remarked upon in these pages on previous occasions,

CLADRASTIS TINCTORIA (YELLOW WOOD).

It is not often that this interesting tree flowers in the British Isles, and it is due probably to

[Photograph by E. J. Wallis.]

FIG. 78.—CLADRASTIS TINCTORIA AS FLOWERING AT KEW.

ment, and a porous not too heavy soil; it is easily injured by much moisture, but applications of manure water when the plants are in full growth are followed by good results. The collar must be placed slightly above the ground level when planted, this part being otherwise liable to be injured by moisture. Increase by means of seed is preferable to division of the root-stock. Fresh seed vegetates from 90 to 95 per cent. in the course of five to eight days. The young seedlings are particularly impatient

the tropical heat of August and September, 1906, that we have been enabled to enjoy them this summer. The species is a native of the inland slopes of the Alleghany Mountains in the States of Tennessee, Kentucky, and North Carolina. Although nowhere very plentiful, the beauty and distinct appearance of this species attracted the notice of the early botanical travellers, and it was introduced to England in 1812. It is to be found in most of the older collections of trees in this country, and in some of them fine

specimens exist. Mr. Elwes has not found one larger than that at Sion, which is 60 feet high, and has a trunk girthing 7 feet. The specimen at Kew, of which an illustration is given at fig 78, is a healthy tree, 35 feet high, with a thick trunk branching low down; the head of branches is 45 feet across.

Cladrastis tinctoria has pinnate leaves, consisting usually of seven or nine leaflets, but sometimes with two or four more. The terminal leaflet is 3 inches to 4½ inches long, obovate or oblong, the lower ones one-half to two-thirds as large. The base of the leaf stalk is swollen so as to enclose the bud, a character which readily distinguishes this species from *C. amurensis*, the only other species in general cultivation. In the latter species the axillary buds are quite exposed.

always dies off a bright yellow in autumn, thus compensating, in some measure, for its uncertain flowering. *W. J. Bean.*

THE GLASGOW PARKS.

GLASGOW is singularly fortunate in possessing a large number of public parks and open spaces. Of the former, indeed, there are no fewer than 36, some of which are so advantageously situated as regards elevation and consequent command of the beautiful country surrounding the city as to have few rivals elsewhere. The Kelvingrove Park, Bellahouston Park, Glasgow Green, Rouken Glen Park, Queen's Park, Tollcross Park, and Springburn Park are

The glen sides are steep, even precipitous, and are densely hung with Ferns of various species, including Lady Ferns, Male Ferns, Polypodies, &c. These Ferns are growing in the greatest luxuriance and abundance, despite the fact that the Glen is a favourite popular resort. Under the care of Mr. James Whitton, who superintends the whole of the parks and open spaces, the danger of vandalistic behaviour, apparently inseparable from free popular access to wild, natural scenes of this description, is being minimised as far as possible by the provision of appropriate rustic fences and well-defined paths. A judicious thinning out of shrubs and tree foliage has revealed delightful vistas, and affords a glimpse of the tumbling stream and its falls, as well as of the Fern-clad walls of the ravine. In this park the maintenance of its naturally wild and picturesque features is the chief object; in Springburn and Tollcross Parks, and also in the Botanic Gardens, however, there are conservatories and considerable ranges of greenhouses, propagating houses, and frames. Some of these are open to the public as houses of floral display, and the contents of others are available for the floral decorations inseparable nowadays from civic banquets and entertainments generally, or for the benefit of the lecturers and students of the university close by. In this particular connection there is a Mossery, in which are hundreds of living specimens of Mosses, Marchantias, &c., in splendid condition, set off here and there by fine varieties of native varietal Ferns, of which a good collection is also planted in the open.

In the Palm house at the Botanic Gardens are some large Tree Ferns and a gigantic Bamboo, which, at a height of 50 feet, has reached the glass roof. Unhappily, the Glasgow air is not of the purest, owing to the immense numbers of industrial manufactories which not only surround but actually permeate the city. But, despite these unfavourable circumstances, it requires a very keen eye to detect a fault, so judicious has been the selection of the plants in cultivation. In Springburn Park a conservatory is provided with a gallery, from which is obtained a comprehensive view of a collection of Tree Ferns, the finest I have seen; these tall Ferns are mingled with Palms, Cordylines, and other plants suitable for a warm, temperate climate. From below, the majestic growths of associated Ferns, Palms, and many other tall-growing plants appear as mere mixtures of interlaced foliage or frondage, the old and shabby growths perhaps predominating, while, seen from above, every plant shows its latest and freshest growths in perfection.

On returning to Glasgow after an inspection of the parks, the aspect of George's Square, in front of the magnificent facade of the Corporation Buildings, appeared to me as incomprehensible. The design consists of a series of unrelieved flat parterres, which, though well kept in themselves, are fenced in with plain, commonplace iron railings of a cheap and common type, forming altogether an *ensemble* which is both unworthy of the site it occupies and the pile of stately buildings which overlooks it. *Chas. T. Druery, V.M.H., F.L.S.* [Fuller particulars of the Glasgow Parks were published in *Gardeners' Chronicle*, November 23 and 30, 1901.—Ed.]

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

A PINK-FLOWERED CLOVE CARNATION.—In reference to the note on this subject by Mr. Dean on p. 172, there is a variety known as the "Blush Clove," but the flower described by Mr. Dean appears to be of a deeper pink colour than this. The "Blush" is a true Clove variety, identical in every respect with the type except in its colour. It is quite possible, however, that soil and situation may influence the colouring of these flowers, just as soil and cultivation effect changes in the flowers of the well-known Enchantress Carnation. The true Clove-scented Carnation does not appear to be much given to sporting, though occasionally white-striped petals are seen among the crimson ones. There is a white variety known as Old White Clove, and which I have never known by any other name. There is also the well-known Gloire de Nancy, which is, perhaps, the finest white Clove

FIG. 79.—FLOWER RACEMES OF CLADRASTIS TINCTORIA.

The flowers, which may be seen illustrated at fig. 79, are produced in June on pendant racemes, about 1 foot in length (occasionally half as long again). They are white, with a yellow spot at the base of the standard petal. The individual flower resembles that of *Robinia pseudacacia*, but the entire raceme is much longer and more lax.

There are few groups of hardy trees more interesting and attractive in gardens than the arborescent members of the Leguminosæ, and the Yellow Wood is far from being the least effective of them. At Kew its foliage nearly

the principal ones. In all, these parks and open spaces occupy 1,226 acres. The latest acquisition, Rouken Glen Park, of an area of 135 acres, was presented by A. Cameron Corbett, Esq., M.P. This park presents the most picturesque effects, its main feature being a deep ravine traversed by a stream of water, which, at no great elevation from the entrance, and at the head of a short and easy ascent, forms a series of splendid cascades (see fig. 80), spanned near the top by a one-arched bridge, beyond and through which the last and widest cascade of the series is seen as a picturesque watery curtain.

in cultivation, and which is quite distinct from the Old White Clove in flower and foliage. Mr. Dean refers to the perfect health of the plants of which he speaks, and this causes one to inquire why town-grown plants of these Carnations are so frequently seen in such fine condition, whilst garden or nursery-grown plants are frequently diseased. The reason, perhaps, is to be found in the excessive or high cultivation sometimes afforded them, and which appears unsuitable to such robust-growing plants. *E. H. Jenkins.*

Sports from the old crimson Clove Carnation have occurred at various times. Some years ago, probably 15 to 18 years, when Messrs. Heath Brothers cultivated the Clove Carnation extensively for market purposes, they had a large stock of a blush-pink variety, similar to that referred to by *A. D.* on p. 172. Mr. H. B. May also had plants of this variety, and many plants were sold by Mr. May to other nurserymen. When the maggot proved destructive, market growers gave up the culture of these flowers, and I have not seen the Blush Clove now for at least 10 years. It was known by no other name than "Blush." A striped variety, with markings similar to those seen in the "Malmesbury" Carnation Lady Middleton, also existed. The white variety referred to by *A. D.* is named Gloire de Nancy, and is one of the most powerfully-scented Carnations I am acquainted with, and it should prove a valuable variety for hybridising, for it possesses great vigour, large flowers, and a beautiful fragrance. It is, however, purely a border variety, and produces flowers from the previous year's growths only. The old crimson Clove Carnation was formerly grown extensively under glass for early flowering, and the blooms sold for almost as good prices as the best American varieties realise now. A year or two ago it was difficult to find healthy plants, but when recently visiting Messrs. H. B. May & Sons' nurseries I found that they had a large stock of the old crimson variety, and also of Gloire de Nancy quite free from the maggot. The best plan for combating this troublesome pest is to give the roots frequent applications of clear soot water, or to syringe the plants with quassia-extract during the summer and autumn months. *A. H.*

I have reason to believe that the pink form originated with Mr. G. Woodgate, when he had charge of the Warren House Gardens, Kingston Hill. I purchased some layers from Mr. Woodgate, when he was selling the plants at the time of the breaking-up of the establishment, following the death of Lady Wolverton, about 12 years ago. I understood from him that the sport was one from the old dark-coloured Clove Carnation. *C. Young, Gardener to W. St. Q. Leng, Esq., Welford Park, Newbury.*

THE SHREWSBURY SHOW.—The time allowed for judging the Grapes in the Champion Class at Shrewsbury was too short. To register accurately the standard point value of 132 bunches of Grapes in the short space of 120 minutes, and, at the same time, maintain the proper relative value by comparison from top to bottom of this number of bunches, and all open to public criticism by experts and others, is not altogether a light business for two men. *D.* wrote on page 172:—"Should a new challenge vase be provided for a champion Grape class, the vase should be made rather more difficult to win than it has been hitherto, and to that end I would suggest that no award be made of the vase except at least six of the bunches shown secure maximum points." Had such conditions been in force, the last vase would not have been won once to this date under the present pointing code. To extinguish a competitor's chance of obtaining the highest award unless he can stage six absolutely perfect bunches is unreasonable. One hears of certain competitors who are rather low down in the scale, and who wish to bring into use the decimal system; but even if this were done, the result would work out exactly the same, and would not assist anyone to creep in at the side door. *W. Crump, Madresfield Court Gardens.*

VERBENA MAHONETI.—Respecting *F. M.*'s enquiry about *Verbena Mahoneti*, p. 173, a plant of this variety of *V. tenera* was displayed in an exhibit staged by Messrs. Heath & Son, Cheltenham, at the show of the Royal Horticultural Society of Ireland, held in Dublin, on August 27. It is, I believe, a native of the Pyrenees. *E. Knowlton, Dublin.*

AN AMERICAN LAWN SWEEPER.—I have not seen Mr. Challis's lawn sweeper in operation, but recently, in Mrs. Budgett's park at Guildford, I saw a lawn cleaner of American construction which could easily be worked by a boy, as it was very light in weight. It collected leaves and other refuse on the turf remarkably well by means of toothed rakes and a rapidly revolving fan which creates a strong current of air. Behind the fan is a bag-like receptacle into which the refuse is cast, and should the wind be strong, a cover can be fixed over the bag. A special recommendation is that the price for such a machine is moderate. No sweeper with a broom could do the cleaning so rapidly or so well as this simple contrivance. It is known as the Pennsylvania Lawn Cleaner. *A. D.*

SOME NEW VARIETIES OF HEMEROCALLIS (DAY LILY).—I have bloomed this summer three varieties of these interesting and generally free-flowering Amaryllids. All of them are of Continental origin, two coming from Herr Sprenger, of Vomero, near Naples, and the third from M. Lemoine, of Nancy, in France. One of the Neapolitan hybrids was named *Fulva-Cypriana*, a most distinct and beautiful variety, with regularly-formed flowers that expand well. In colour they are of a clear brown shade, with a clearly-defined and slightly raised yellow midrib down the centre of each of the alternate petals. This is

FIG. 40.—WATERFALL IN ROUKEN GLEN PARK, GLASGOW (see page 187.)

one of the most beautiful *Hemerocallis* known to me. The second was named *Ful-Citrina*, and is a comparatively dull and worthless variety, with flowers of thin texture. The French seedling is named *luteola-pallens*, being probably either a sport or seedling from the same raiser's beautiful hybrid distributed some few years ago under the name of *luteola*, and which, curiously enough, is identical with one of Herr Sprenger's hybrids sent out under the name of *Parthenope*. The new French hybrid is distinctly good, with large, well-formed flowers of a pale shade of canary yellow. *W. E. Gumbleton.*

SCHOOL GARDENS AT LEYTON.—Excellent work has been done at Leyton, Essex, by the establishment of gardens for the boys in the elementary schools under the control of the Urban District Council. The chairman of the Education Committee, Mr. J. B. Slade, who is widely known in the horticultural world as one of the partners in Messrs. Protheroe and Morris, has taken a prominent part in the initiation of the scheme, and he has had the cordial support of Mr. Thomas Tiley, the Organising Inspector of Schools, who takes a great interest in the matter. The practical supervision of the work has been entrusted to the energetic Superin-

tendent of Parks and Open Spaces in Leyton, Mr. K. J. Frogbrook, who ably carried out the work of preparatory cultivation and general planning of the gardens, with the system of cropping and all essential technical details. The instruction of the boys has been mainly left with the school teachers who have passed an examination in horticulture; with, of course, reference to Mr. Frogbrook in all cases of difficulty. In 1906 a beginning was made with six classes, but this season there are 11 classes at different schools, each comprising 16 boys. Every student and worker is allowed about a square pole of ground, and under the direction of the teacher or superintendent, performs the whole work of digging, trenching, sowing the seeds, staking, hoeing, watering, etc. The seeds, tools, stakes, and manures are provided by the Urban District Council, but a large part of this expense is defrayed by the Board of Education grant to each school. The boys are allowed to have the whole of the produce, and they thus receive a material reward for their labour, which is greatly appreciated. On Saturday last (Aug. 31) the first competitive exhibition of the school garden vegetables and flowers was held at Leyton, when 11 classes were provided (one for each school), and 14 boys contributed collections of vegetables or bunches of flowers. The competition was thus confined in every case to the workers on each particular group of gardens, and the schools were not pitted against each other. Three prizes were offered for every school, and the general quality of the exhibits was alike creditable to the teachers and the pupils. The judges adopted a system of pointing throughout, and the results were highly satisfactory; for example, taking the 11 classes, the first prize-winners secured an average of 72 per cent. of the possible total points, in one case rising to 90 per cent. of the total. The second prize-winners averaged 67 per cent., and the third prize collections secured 66 per cent. of the total points. There was considerable difference in the standards of the various schools, but some have much less favourable soils and situations for the gardens than others, hence the reason for judging them all separately. Considerable local interest is taken in the scheme, and a large crowd assembled at the distribution of prizes in the afternoon, when Mr. J. B. Slade addressed the winners in an admirable commendatory, encouraging, and instructive speech. That such work as this, on the right lines, is of inestimable service in many directions was amply demonstrated to the judges by the exhibits, and by the subsequent inspection of the well-kept gardens attached to the schools. Another season's course of instruction is about to be commenced, and the desire to be amongst the fortunate lads selected to form the class acts as a considerable incentive to good conduct. *R. Lewis Castle.*

EUCRYPHIA PINNATIFOLIA.—Whilst spending a holiday recently in Cornwall I visited the gardens of Trewidren, the residence of T. B. Bolitho, Esq., especially to inspect a plant of *Eucryphia pinnatifolia*. This specimen, probably the finest in the country, measures roughly 30 feet in height and 15 feet in width, and at the time of my visit it was a mass of flowers. The tree was planted some years ago by the present gardener, and no check has since marred its progress. I regret no means were at hand for my obtaining a photograph of this beautiful tree. *A. Bullock, Copped Hall Gardens.*

THE SOWING OF CYCLAMEN SEED.—Like Mr. Fulford (see p. 172), I prefer to sow in August, but there were no Cyclamen plants here at the time I engaged about 12 months since, and I intend to flower Cyclamen next Christmas that have been raised from seeds sown on February 16 last. I have two dozen plants in 5-inch pots. They are well-rooted, and have about two dozen leaves on each plant; flowers, in most instances, being already observable. The seeds were sown in a lean-to structure, in which the atmospheric temperature was 55° at night and 60° to 65° by day. The plants have since been kept on a shelf near to the glass; no fire heat has been employed during the past month, although the sun only shines on the house from 10 a.m. to 4.30 p.m. The compost I used was similar to that recommended by Mr. Fulford, except that in place of the bone-meal I used burnt ashes. About five years ago, at a Gardeners' Improvement Society, I heard a lecturer say that if

Cyclamen seeds were sown in February, the resulting plants could easily be abundantly flowered in December. *W. Ettey, St. Clements, York.*

THE BLACK CURRANT GALL MITE.—During 1905-6 and 7 I have gratuitously distributed upwards of 3,000 reports to different fruit growers in the British Isles, giving particulars of the lime and sulphur treatment for the Black Currant Gall Mite. Many of these growers have since written me and stated that "the cure recommended has proved most successful," or "we are entirely free from 'Big Bud' now." I propose issuing, shortly, a further report upon this subject in which many of these reports will be incorporated and I invite all growers who have tried this remedy to write me stating upon how many acres, or bushes, they have tried it, with what result, and if they have any objection to their report being published with the others (not necessarily with their name and address). *Walter E. Collinge, University of Birmingham, Dept. of Economic Zoology, Birmingham.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 3.—The display of flowers and fruits at the fortnightly meeting on Tuesday last was well up to the average for this season of the year. An outstanding feature was a collection of hardy Bamboos in about thirty varieties and species shown by Messrs. JAS. VEITCH & SONS. Dahlias reminded visitors of the approaching autumn, and one exhibit of these flowers was of especial merit.

Several good displays of fruits were seen. Among the Orchid exhibits were several meritorious groups; the most noteworthy being a group of six plants of *Lissochilus giganteus*, shown by the Hon. WALTER ROTHSCHILD.

Novelties were plentiful amongst flowering plants, and the FLORAL COMMITTEE awarded no fewer than twelve Awards of Merit, of which four were given to varieties of Dahlias.

The ORCHID COMMITTEE granted two First-Class Certificates, three Awards of Merit, and one Botanical Certificate.

The FRUIT and VEGETABLE COMMITTEE made no award to a novelty.

At the afternoon meeting nine new Fellows were elected, and a paper on "Lesser Known Orchids," illustrated by lantern slides, was read by Mr. F. W. Moore, Glasnevin.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. Henry B. May, Chas. T. Drury, Geo. Nicholson, T. W. Turner, W. Cuthbertson, H. J. Jones, Chas. Dixon, W. Bain, A. Turner, W. Howe, R. C. Notcutt, R. Hooper Pearson, and C. R. Fielder.

Messrs. H. B. MAY & SONS, Edmonton, showed a miscellaneous collection of greenhouse flowering plants, interspersed with decorative varieties of Ferns. The exhibit included *Ixora aurantiaca*, *Solanum jasminoides*, *Campanula isophylla*, *Heliotropes*, a variegated-leaved *Oleander*, and the white-flowered variety *Madonna*; *Abutilon Boule de Nieve* and others; *Statice profusa*, *Swainsonia*, *Lobelia cardinalis*, *Bouvardias*, &c. (Silver-Gilt Banksian Medal.)

LORD ALDENHAM, Elstree, Herts. (gr. Mr. Edwin Beckett), filled the side of one table with vases of Pentstemons. The range of colouring in the varieties was very wide—some were almost pure white, and others dark crimson, with varieties of most of the intermediate shades. The strain is exceptionally fine, and the culture of the flowers was of the highest excellence. (Silver-Gilt Flora Medal.)

A remarkable collection of Bamboos and allied plants was displayed by Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea. There were more than 30 varieties and species in this group, some of which, including *Arundinaria japonica* and *Phyllostachys Quiloi*, were over 10 feet in height. Amongst the rarer species we noticed *Bambusa angustifolia*, *Arundinaria nobilis*, and *Phyllostachys Castillonis*. Two of the showiest were *Arundinaria Fortunei* variegata and *A. auricoma*. In another part of the Hall, Messrs. VEITCH exhibited large plants of *Senecio clivorum*, *Aconitum Wilsoni*, and *Artemisia lactiflora*. (Gold Medal.)

Messrs. W. PAUL & SONS, Waltham Cross,

Herts., showed an excellent collection of Roses. The flowers were arranged in a setting of moss in baskets, an arrangement that was pleasing and that enabled the varieties to be critically examined. A new variety was exhibited under the name of Mrs. Dudley Cross. The blooms of this new Rose are cream-coloured, with a suffusion of rose in the older flowers. The buds are yellowish. Amongst the best of the older kinds were Frau Karl Druschki, Caroline Testout, Liberty, Mme. Jules Grolez, Madame Leon Pain, and Marie van Houtte. (Silver-Gilt Flora Medal.)

Messrs. FRANK CANT & Co., Colchester, displayed an assortment of Roses, some of the best blooms being those of Irish Elegance, Mrs. R. G. Sharman Crawford, Dupuy Jamain, Mad. Abel Chatenay, Commandant Felix Faure, and Ulrich Brunner. (Silver Banksian Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, N., exhibited vases of Carnations of the choicer varieties of the American or winter-flowering type. The blooms were of exceptionally good quality. (Silver Flora Medal.)

Messrs. G. STARK & SON, Great Ryburgh,

Phloxes, of such beautiful varieties as *La Sylphide*, *Tapis Blanc*, *Leonardo de Vinci*, *Esperance*, *Sheriff Ivory*, *Iris*, *F. von Lassberg*, *Coquilicot*, *Josephine Gerbaux*, *Crepuscule*, &c. (Silver-Gilt Banksian Medal.)

Misses E. & M. KIPPING, Hutton, Essex, displayed a small group of hardy flowers.

Mr. J. SPENCE, Wycliffe House Gardens, Guildford, exhibited *Alyssum maritimum*, with the notification that it was the original variety raised by the exhibitor's father many years ago.

Messrs. KELWAY & SON, Langport, Somerset, again exhibited a very excellent display of Gladioli, in all some 200 flower-spikes, representing more than 100 varieties. Marquess of Northampton (rose colour) and Purity (white) were two of the finest amongst this excellent collection. (Silver-Gilt Flora Medal.)

Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham, showed a group of hybrid Fuchsias, apparently crosses between *F. triphylla* and *F. fulgens*. They were freely flowered in small pots, and included varieties with flowers of scarlet, rose, and other shades of red. (Bronze Flora Medal.)

FIG. 81.—LYCHNIS GRANDIFLORA: COLOUR SALMON-ROSE.

Norfolk, showed vases of Sweet Peas that were interspersed with named varieties of Tropæolums.

Mr. AMOS PERRY, Enfield Chase, London, N., showed well-cultivated hardy flowers, including most of the best kinds in season. We noticed some good forms of *Lychnis Haageana*, some handsome spikes of *Liatis pycnostachya*, *Lilium auratum* in variety, sturdy *Tritomas*, a basket of the handsome *Stokesia cyanea præcox*, &c. (Silver-Gilt Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, exhibited seasonable hardy flowers, amongst which were many showy Composites. (Silver Banksian Medal.)

Messrs. G. BUNYARD & Co., Maidstone, also showed a display of garden flowers, of such kinds as *Montbretias*, varieties of *Lobelia*, *Gladioli*, *Lilium tigrinum*, and others. (Silver Banksian Medal.)

Messrs. GUNN & SONS, Olton, Birmingham, displayed a large and varied collection of garden

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed varieties of hardy Fuchsias, many of which are suitable for summer bedding. Interspersed amongst the Fuchsias were small, freely-flowered plants of Clematis, and a number of Eleagnuses, with showy foliage. (Silver Banksian Medal.)

Messrs. W. BULL & SONS, King's Road, Chelsea, showed ornamental stove and greenhouse foliage plants in variety, the group being enlivened with choice Orchids in flower. (Silver Banksian Medal.)

Mr. LL. GWILLIM, Cambria Nurseries, New Eltham, Kent, staged a large exhibit of flowers of tuberous rooting Begonias. They were shown in batches of one colour, with suitable greenery intermingled amongst them; the whole formed a very attractive display. (Silver Flora Medal.)

Messrs. JARMAN & Co., Chard, showed their improved varieties of Centaures in white, heliotrope, light-yellow, and dark-yellow colours. (Bronze Flora Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, exhibited plants of early-flowering Chrysanthemums. (Bronze Flora Medal.)

Several exhibits of Dahlias were staged. A magnificent collection of these flowers was put up by Messrs. CARTER, PAGE & Co., London Wall, London. This firm showed examples of all the types—single, cactus, show, pompon, &c., in many of the newer and the best of the older varieties. The blooms were arranged in baskets, epergnes, and vases, with sprays of Ampelopsis and tall vases of Grasses, small Palms, &c., between them. (Silver-Gilt Flora Medal.)

Mr. H. SHOESMITH, Westfield, Woking, Surrey, also showed varieties of this seasonable flower, the cactus-flowered varieties being especially fine.

Dahlias were also shown by Messrs. JOSEPH CHEAL & SONS, Crawley, Sussex. This firm exhibited a number of new varieties, the best of which is described under Awards. As a background to the Dahlias, were vases of choice, hardy flowers. (Silver Banksian Medal.)

AWARDS OF MERIT

were made to the twelve plants stated below:—

Arctotis regalis.—This *Arctotis* is described as a hybrid from *A. aureola* (orange-coloured) and *A. grandis* (white, with mauve colour on the exterior of the segments). *A. regalis* is a larger flower than either of the reputed parents; the blooms are pure white, with purple anthers, and narrow band of yellow immediately around the disc. On the exterior of the segments there is a slight tinting with pale purple. The flowers have erect stems, more than 1 foot in length. Shown by Sir TREVOR LAWRENCE, Bart. (gr. Mr. W. Bain).

Canna Madame Louis Voraz.—A large, yellow-flowered variety, richly veined with red, almost in circles, the red colour becoming confluent in the lower segments. Shown by Sir TREVOR LAWRENCE, Bart. (gr. Mr. W. Bain).

Carnation Mrs. T. Coulthwaite.—This is a first-class white border variety, with non-splitting calyx. It has an exceptionally free habit, and the flowers are fragrant. Shown by Mr. P. BLAIR, Trentham.

Dahlia "Alice".—This is a white decorative flower of the "Cactus" type with a little lemon colour showing at the base of the segments towards the centre of the flower. It is too small for exhibition purposes, but, having good, stiff stems, will be a useful decorative Dahlia.

D. "Mauve Queen".—An exhibition Cactus-flowered Dahlia, coloured mauve with white centre.

D. "Peggy".—This single Dahlia is remarkable for its colouration. The tips of the floral segments are purplish-rose, but this is followed a little lower down by orange, and at the base the colour is rich rosy-crimson, the effect being, therefore, one of purplish-rose, orange, and crimson in circles. The three varieties just described were shown by Messrs. J. CHEAL & SONS.

D. "Elsa Ellrich".—In this variety cultivators will find a large-flowered, exhibition, Cactus Dahlia of good form, and rich yellow colouring throughout. Shown by Mr. H. SHOESMITH.

Fuchsia "Coralie".—A variety obtained from *F. triphylla*, or possibly a hybrid from this species and *F. fulgens*. The flowers are 1½-inch long, and are produced in good clusters. The calyx lobes are short, as in *F. triphylla*, and the petals are even shorter. The colour is pale, or salmon red. This variety and other similar ones have been introduced from Germany. The present specimen was shown by Mr. H. J. JONES.

Gaillardia grandiflora, variety *Lady Rolleston*.—This is a magnificent variety of the species. The flowers are rich yellow-coloured throughout, and are 4 inches in diameter. They are produced on erect stems 2 feet or more in length. Shown by Messrs. HARRISON & SONS, Leicester.

Gladiolus Purity.—A large-flowered white variety, very slightly marked with purple, and having a suspicion of pale yellow on the lower segments. It is one of the best white varieties we have seen. Shown by Messrs. KELWAY & SON.

Lychnis grandiflora.—Mr. AMOS PERRY showed plants of this species, which is a native of China and Japan, and of which an illustration is reproduced at fig. 81. Mr. PERRY's plants are said

to have been collected in Thibet, and there were four distinct varieties, each of which differed in its degree of merit as a garden plant. One form had orange-coloured flowers, and the petals were divided in much the same manner as shown in the illustration. The type, however, selected for receiving the Award of Merit had flowers 3 inches in diameter, with large, overlapping petals of rosy-crimson colour. The plants grow to a height of 2 feet or more, but for some unexplained reason the species has, until the present, remained in cultivation in this country only for short periods, although it was introduced more than a century ago, and on several subsequent occasions. The type that was granted an Award of Merit on Tuesday last is probably the largest-flowered variety so far observed.

Pentstemon.—An excellent strain shown by Lord ALDENHAM.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair); and Messrs. Jas. O'Brien (hon. sec), Harry J. Veitch, H. Little, W. Boxall, F. W. Moore, W. P. Bound, A. Dye, H. T. Pitt, W. Cobb, J. Charlesworth, W. H. White, H. G. Alexander, H. A. Tracy, W. A. Bilney, F. Peeters-Carter, and W. Botton.

The exhibits of Orchids were very interesting, and especially a group of splendidly-grown plants of *Lissochilus giganteus*, for which the Hon. WALTER ROTHSCHILD, Tring Park, Tring (gr. Mr. A. Dye), was awarded the Silver-Gilt Lindley Medal. The group was composed of six fine plants, furnished with bright green plicate leaves and bearing between them nine flower-spikes, each about 7 feet in height, the individual spikes having from 20 to 30 flowers. The prominent bracts and reflexed sepals were green, tinged with purple; the orbicular-shaped, bright rose petals and massive lip forms the showiest feature. The lip varies in tint from light rose to pale violet, with a distinct whitish callus. The plants are grown at Tring as semi-aquatics until the flowers appear, when they are allowed to develop in a warm plant house in a similar manner to the allied *L. Horsfallii*, illustrated from the Tring Park specimens in the *Gardeners' Chronicle*, March 31, 1906. The species exhibited is a native of tropical Africa, the plants being imported from the Congo (see fig. in *Gardeners' Chronicle*, May 19, 1888, p. 617).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for a showy group of Orchids, principally hybrids, the centre of the exhibit being occupied by the superb *Cattleya Iris His Majesty* (see Awards). The group also contained a plant of the pretty new, lilac-tinted *Brasso-Cattleya Ena* (*C. Lawrenceana* × *B. Digbyana*); a good selection of *Lælio-Cattleya Bletchleyensis*, *L.-C. Dominiana*, *L.-C. Parysatis*, *L.-C. Wellsiana*, *Brasso-Lælia Digbyanopurpurata*, *Brasso-Cattleya Digbyano-Warscewiczii*, *Cypripedium Jas. H. Veitch*, and other *Cypripediums*.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, were awarded a Silver Flora Medal for a pleasing group, in the centre of which was a selection of their fine type of *Cattleya Iris*. Around these were plants, including a good white form of *C. Gaskelliana vestalis*, *C. atalanta*, *C. Mrs. Pitt*, *C. Fowleriana*, and various showy *Lælio-Cattleyas*. At one end of the display were several finely-bloomed *Ancistrochilus Thompsonianus*, var. *Gentilii*, strong specimens of *Miltonia vexillaria Leopoldii*, *M. v. robusta*, *M. spectabilis Moreliana*, *Odontoglossum Rolfeae*, and other *Odontoglossums*; a specimen of *Brasso-Cattleya Digbyano-Warscewiczii*, with three well-developed flowers on one spike. Among the species was the remarkable *Cirrhopetalum ornatissimum*, with a spray of singular flowers having fringed dorsal sepals and petals. We also noticed *Bulbophyllum Godseffianum*, a well-grown specimen of *Epidendrum prismatocarpum*, the fine *Cymbidium erythrostylum*, *Vanda Kimballiana*, &c.

Messrs. SANDER & SONS, St. Albans, received a Silver Flora Medal for a group of Orchids, in the centre of which was a selection of their new *Cattleya Davidii* (*velutina* × *Hardyana*), the varieties varying much in the pretty rose, bronze, and purple flowers, the varieties *rubra* and *aurea* being the best. On either side of the group were selections of *Lælio-Cattleya Bletchleyensis*, *L.-C. Henry Greenwood*, and

other hybrids. *Cattleya Ethelreda* (*O'Brieniana* × *Dowiana*) has pretty blush-white flowers, with deflected, rosy-purple lip; *Lælio-Cattleya Magnæi* (*L. tenebrosa* × *C. granulosa*), has long, cream-white sepals and petals that are veined with purple, and having an elongated purple labellum. *Odontoglossum blandomobile* has pretty white flowers that are spotted with purple. Various *Cypripediums* and other hybrids were included in the display.

Messrs. HUGH LOW & Co., Enfield, were awarded a Silver Banksian Medal for an exhibit that contained *Cattleya Gaskelliana alba*, *C. Parthenia* "Prince of Wales," *C. bicolor*, two dwarf specimens of the yellow *Sobralia xantholeuca nana*, *Oncidium oblongatum* and its variety *citrinum*, which has yellow flowers without bars of brown on the sepals, *Cypripedium Gowerianum magnificum*, *C. vexillarium*, and other *Cypripediums*.

Major G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. Alexander), showed *Brasso-Cattleya Madame Hye*, *C. Iris*, Holford's variety, a very handsome form; a good *Oncidium Jonesianum*, and cut spikes of a fine *Vanda Sanderiana*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, showed a small group. The new *Cattleya Armstrongiae* (*Hardyana* × *Loddigesii violacea*), a pretty rose-coloured flower, with orange centre to the lip, which has a rose-purple blotch on front, was noticed; also *Cattleya Iris inversa*, with bronzy sepals and petals and rich purple lip; *Cattleya elatior*, *C. Madame Hye*, *C. fulvescens*, and a pretty hybrid between *C. Percivaliana* and *C. Schilleriana*.

Messrs. STANLEY & Co., Southgate, staged plants of *Cattleya bicolor*, *Lælio-Cattleya elegans Harrisii*, a variety having large, rich, purple-tinted flowers; and the singular *Brassavola cucullata*.

Messrs. HOOLEY BROS., Bitterne Park, Southampton, sent a flower-spike of *Cattleya granulosa* with 10 blooms.

H. T. PITT, Esq., Rosslyn, Stamford Hill, showed *Cattleya Hardyana* Countess of Derby, a superb white-petalled form with intense ruby-crimson lip, and which had previously received a First-Class Certificate as *C. Warscewiczii* Countess of Derby.

JEREMIAH COLMAN, Esq., Gatton Park (gr. Mr. W. P. Bound), displayed a clear yellow form of *Brasso-Lælia Fladosa* (*L. flava* × *B. nodosa*); the pale yellow, fringed-lipped *Chondrorhyncha Chestertonii*, and the singular *Cirrhopetalum appendiculatum*.

WALTER COBB, Esq., Rusper (gr. Mr. C. J. Salfer), showed *Lælio-Cattleya Iris*, *Dulcote* variety, and *L.-C. Ashtonii*.

Mr. MAURICE MERTENS, Ghent, showed *Odontoglossum Rolfeae magnificum*, a very large and finely-formed flower.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Iris His Majesty (*bicolor* × *aurea*), from Messrs. JAS. VEITCH & SONS, LTD., Chelsea. This is probably the finest form of *C. Iris* ever shown, and a remarkable reversion towards *C. aurea* both in size and colour. The specimen carried three very large flowers, the broad sepals and petals having a yellow ground colour tinted outward with an old-gold tint and shaded with bronze, passing to sulphur yellow towards the margin. The base of the lip is yellow, with red lines running into the centre, which is marked with orange. The broad front lobe is coloured a rich ruby-crimson. It was originally raised by Messrs. CHARLESWORTH & Co., who also were voted a First-Class Certificate for the plant, but the Award was withdrawn as a painting of the flower was not secured.

Brasso-Lælio-Cattleya Rowena (*L.-C. Doris* × *B. Digbyana*), from Major G. L. HOLFORD (gr. Mr. H. G. Alexander). A very fine flower, and a good addition to the hybrids of *Brassavola Digbyana*, especially on account of the bright colour of its flowers. The flower approaches in size and shape that of *Brasso-Cattleya Digbyano-Mossiae*, but the fringe on the lip is not so deep as in that variety. The colour is a clear, light yellow, with some emerald green lines at the base of the lip.

AWARDS OF MERIT.

Stanhopea platyceras, from the Hon. WALTER ROTHSCHILD, M.P. (gr. Mr. A. Dye). A very handsome and rare species, and one of the largest of the *Stanhopeas*. The broad, rather

concave sepals are cream-white, and closely dotted with purple; the narrower, recurved petals are also cream-white, but tinged with rose and spotted with purple. The long, boat-shaped hypochil has a whitish base that is heavily tinged and spotted with blackish-purple. The horns of the middle portion of the lip are broad and flat, and they form a distinguishing feature for the species, and, like the fleshy epichil, are white spotted with purple.

Cattleya Hardyana var. *Madame Valcke*, from Monsieur A. A. PEETERS, Brussels. A charming variety, with white sepals and petals, the lip being somewhat like that of a light form of *C. Warscewiczii*; the colour is rose, with a yellow patch on either side of the tube, and a broad pale lilac margin.

Sophro-Lalio-Cattleya Phyllis (Sophro-Lælia læta × *C. Lawrenceana*), from Major G. L. HOLFORD. A hybrid of dwarf habit, and with pretty rose-purple coloured flowers, having a claret-purple front to the labellum. The flowers are of good size and shape.

BOTANICAL CERTIFICATE.

Eulophia ensata, from the Hon. WALTER ROTHSCHILD. An African species, with lanceolate, plicate leaves and tall inflorescence, bearing a dense head of pale yellow flowers: the lip has a hairy orange-coloured crest. The species is figured in the *Botanical Register*, t. 1147.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (chairman); Messrs. Jos. Cheal, W. Bates, W. Pope, H. Parr, Horace J. Wright, H. Markham, Jno. Lyne, Owen Thomas, Chas. Foster, J. McIntosh, W. Poupert, W. Wilks, J. Vert, Geo. Woodward, J. Davis, and A. R. Allan.

A fine collection of fruiting trees in pots was shown by the KING'S ACRE NURSERY CO., Hereford. Especially fine were espalier trees of Peaches, the variety Sea Eagle being freely fruited. Thos. Rivers Peach was also shown fine fruited, and another tree heavily cropped was *Violette Hative* Nectarine, although the fruits were small in size. Trained vines in pots of Gros Maroc, Black Alicante, Lady Hutt, Alnwick Seedling, and others were staged at the back of the exhibit. The specimen of Alnwick Seedling was one of the best cropped pot vines we have seen. The exhibit also included Apples Cox's Orange Pippin, James Grieve, Worcester Pearmain, and Washington; Late Orange Plum, Conference, Marguerite Marillat, and other Pears, with tall plants of Red Currants, and small trees of Figs. (Silver-Gilt Hogg Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a collection of hardy fruits. At the back of this exhibit were Apples and Pear trees in pots, all of which had been grown in the open. Boxes of Plums, including the varieties Bryanton Gage, McLaughlan's Gage, Oullin's Golden Gage, and a very finely flowered red Gage, which is probably a new variety of merit. A row of large, well-finished Apples formed a suitable finish to the group. The varieties of Apples included Red Quarrenden, Red Astrachan, Duchess of Oldenburg, Worcester Pearmain, and Lady Sudeley. Messrs. CANNELL showed a new Apple, labelled Cannell's Market. It is a prolific cropper—as many as 24 fruits were exhibited on a small branch, and these ripen early in the season. (Silver-Gilt Knightian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, showed 50 trained fruit trees in pots. The best specimens were those of Pears and Plums. An excellent example of Belle de Louvain Plum was afforded a prominent position. Purple Gage and Cox's Emperor Plums were also heavily cropped. Trees of Beurré Jean van Geert and Marguerite Marillat Pears were carrying finely finished fruits of large size. The examples of Souvenir du Congrès, Charles Ernest and Conference Pears were also worthy of mention. Ben's Red Apple was highly coloured. Figs, too, were displayed in well-cropped examples, the best being Brown Turkey and Negro Largo. (Silver-Gilt Banksian Medal.)

Messrs. GEO. BUNYARD & CO., Maidstone, Kent, showed a miscellaneous assortment of fruits—Apples, Pears, Peaches, Apricots, Plums, Damsons, Nuts, and Cherries. Of Plums, we noticed White Magnum Bonum, the Burbank Plum (an attractive fruit in appearance), the Wickson Plum, Sultan, and Belle Louvain; Apples Lady Sudeley, Worcester Pearmain, and Red Quarrenden, all of which were coloured

highly; Duchess of Oldenburg, and very fine fruits of Stirling Castle. The best Pears in the group were Triomphe de Vienne, Williams' Bon Chrétien, Doyenné du Bossoch, and Marguerite Marillat. (Silver-Gilt Knightian Medal.)

Mrs. BRACE, Doveridge Hall, near Derby, showed a collection of hot-house fruits. A dish of Barrington Peaches was especially good. Bunches of Grapes, somewhat small, but with well-finished berries, formed a background to the collection, which included Peaches, Nectarines, Pears, Cherries, Figs, Plums, and Melons. (Silver Knightian Medal.)

The usual array of Seedling Melons was seen on the table devoted to novelties, but none was found worthy the distinction of an Award.

The curious Cucurbitaceous fruit known as Lemon Cucumber was shown by Messrs. BARR & SONS, King Street, Covent Garden, W.C. It was of ovoid shape, lemon-coloured, with a number of black dots, apparently rudimentary spines.

LECTURE ON LESSER KNOWN ORCHIDS.

The lecture at the afternoon meeting of the Fellows was by Mr. F. W. MOORE, Curator of the Glasnevin Botanic Gardens. The lecturer treated of Orchid giants, pigmy Orchids, species having some peculiar habit or structure, pendulous-growing varieties, Orchids of remarkable appearance, and others that are remarkable for requiring some special cultural treatment. Amongst the largest of Orchids is *Grammatophyllum speciosum* (illustrated in the last issue of the *Gardeners' Chronicle*), *Arachnanthe Lowii*, and the very rare *Eulophiella Peetersiana*. *Cyrtopodium Andersonii* bears an inflorescence that reaches a height of 4 feet 4 inches. *Cypripedium Lindleyanum* at Glasnevin developed leaves 2 feet 3 inches in length and 3½ inches in breadth, whilst the flowers were borne on inflorescences 4 feet 9 inches in height. *Arachnanthe Lowii* produced six inflorescences in the Glasnevin Gardens, each measuring 6 to 7 feet, and it is curious that this species produces dimorphic flowers, for the basal ones are quite different in shape and colour to those on the upper portions of the inflorescence. (See also *Lissochilus giganteus*, a gigantic species, figured in *Gardeners' Chronicle*, May 19, 1888, p. 617.—The inflorescences reach a height of 8 feet.—ED.)

Among pigmy Orchids, Mr. Moore enumerated *Pleurothallis asterophora*, *P. hypnicola*, *P. simmleriana*, and *P. lateritia*. *P. hypnicola* is one of the smallest of Orchids, its flowers being so inconspicuous that they can scarcely be seen. *Maxillaria funerea*, *Masdevallia nidifica*, and *Megacalinum minutum* are dwarf representatives of three other genera. The lecturer referred to the curiously-flowered *Arachnanthe annamensis*, which produced an inflorescence bearing eight to ten flowers, each 5 inches in length and with transverse bars of yellow on a red ground (see fig. in *Gardeners' Chronicle*, May 12, 1906, p. 290). Some of the most curious adaptations of Orchids are to be found in their labellums. In some species this organ is fleshy, as in *Stanhopea*, and in others, such as *Brassavola*, it is hairy but fixed. In *Bulbophyllum*, however, it is not only hairy, but hinged, so that it moves with the slightest displacement of the air. *Bulbophyllum barbatum* is a well-known species, but *B. tremula* is not so commonly seen. It has a heavy fringe of hanging hairs, which give the plant a singular appearance. The curious habit of growth of *Masdevallia deorsa* was referred to, and Mr. Moore stated that this species refuses to grow in any other position than a pendulous one. *Lycaste Dyeriana* dies if it is not allowed to grow with its roots uppermost. The species was flowered at Glasnevin in 1896. A curious adaptation of growth is seen in *Epidendrum versicatum*; the leaves of this plant form a cup, the upper pair enclose the flowers and form a sealed chamber, so that were they pointing in the normal upward position, the flower-spike would become rotted owing to the presence of water.

Other species of Orchids which require a pendulous position are *Brassavola nodosa*, *Cattleya citrina*, and *Scutecaria Steelii*. In opposition to this habit of growth are varieties which must be grown in a perfectly upright position, with their growths erect. *Coleogyne triplicatula*, when planted in an ordinary flat manner, refused to grow, but it was trained erect and it succeeded splendidly. It is a very scarce species, with brownish-yellow coloured

flowers, having darker lips, with marked keels. Some Orchids are self-fertile to a high degree, and of this class is *Dendrobium Brymerianum*, but, as is to be expected, the flowers of this plant are quite unimportant in appearance. *Cymbidium grandiflorum* (syn. *C. Hookerianum*) seldom opens its flowers, which are self-fertilised.

A curious plant is *Pleurothallis immersa*. The flower-spike appears to develop from the leaf blade about half-way up. There is a channel or tunnel in the leaf, and the growth is not contiguous. The usual appearance of an Orchid flower is with the lip in the lower position, but this is due to torsion in the ovary, and when, as in *Eria globifera*, the torsion is not present the lip is uppermost, and what is really the correct position of the flower appears abnormal.

The lecturer also referred to Orchids having a peculiar growth of pseudo-bulb and foliage, and showed lantern slides of some, including *Hexisia bidentata* and *Hexadnesia crurigera*. Mr. Moore stated that the genus *Maxillaria* contains several species with remarkable flowers, one of the most interesting being *M. fractiflexa*, which has curiously twisted sepals and petals (see *Gardeners' Chronicle*, May 31, 1902, fig. 125).

READING HORTICULTURAL.

AUGUST 28.—The annual exhibition of this society was held in the Forbury Gardens on the above date. The number of the exhibits exceeded those of last year—the jubilee year of the society—and this necessitated the provision of larger tents.

Outstanding features of the show were the exhibits of vegetables and fruit, and especially the collection of vegetables shown by Mr. James Dymock (gr. to GEO. D. FABER, Esq., of Wallingford), in the class for ten kinds of vegetables, the prizes being offered by Messrs. Sutton & Sons. The 1st prize in the class for six varieties of vegetables was won by Mr. George Ellwood (gr. to Mr. W. H. MYERS, Bishop's Waltham, Hants.), but there was not much difference of quality between this exhibit and that of the 2nd prize-winner, Mr. A. Basile (gr. to the Rev. THOMAS McMURDIE, Weybridge). In the cottagers' classes the produce was exceedingly well grown, Potatoes especially. Fruit was good considering the backward season. Exhibits of Grapes were of moderate quality, the best were shown by Mr. J. WILLIS FLEMING, of Romsey (gr. Mr. Mitchell). The same remark applies to Peaches, the exception being a fine dish of "Golden Eagle," shown by S. MONCK, Esq., Coley Park (gr. Mr. A. J. Booker). Nectarines and Plums were of good quality, but Pears and Apples lacked colour.

The class for a group of plants arranged for effect produced four good groups. The 1st prize was taken by EDWARD WAGG, Esq., of Maidenhead (gr. Mr. D. Phillips). Lady Cooke secured the 2nd prize for a group that was somewhat crowded, but the plants were well-grown specimens. Fuchsias made a good display; those shown by Mr. J. FRIEDLANDER, of Whiteknights, were considered the best, but those shown by Miss K. RATCLIFFE, Westfield, Reading, were not far behind those of the 1st prize group in point of quality. Mr. WAGG won the 1st prizes for stove Ferns and for stove plants of a miscellaneous character with well-grown specimens; Mr. S. B. JOEL was an easy 1st prize-winner for tuberous Begonias in the open class. The decorative classes were somewhat disappointing, and there was a lack of originality. In the open classes for Dahlias, Mr. JOHN WALKER, of Thame, was very successful, taking three 1st prizes. In the Rose classes open to amateurs only, Mr. C. E. KEYSER, of Aldermaston, won the premier award; 2nd, Mr. H. W. DUNLOP, Earley.

The non-competitive exhibits formed a very attractive feature of the show. Messrs. POWELL & SONS, Bath Road Nurseries, Reading, were awarded a Silver Medal for a group of floral designs, foliage plants, &c.; Messrs. HICKS & BLOOMFIELD, Calcot Nurseries, Reading, received a Silver Medal for a display of Roses; Mr. T. RIGG, Caversham, was also awarded a Silver Medal for cut Roses; and Messrs. JAS. HOLLIER & SONS a Silver Medal for a group of plants, &c. Messrs. WEBB & SONS, Stourbridge, showed a miscellaneous group of Sweet Peas, Carnations, and other flowers; fruit, vegetables,

&c., for which the Society's Gold Medal was awarded. Mr. FRED EAMES, Frome, was given a Silver-Gilt Medal for a collection of hardy flowers.

NATIONAL DAHLIA.

(By TELEPHONE.)

SEPTEMBER 5 and 6.—A year ago at the holding of the annual show of the National Dahlia Society, we referred in these pages to the extraordinary climatic conditions the plants had experienced in the last week of August and first week in September. The ground was dry, the atmosphere hot, and bright sunshine was registered almost every day! But such are the means that gardeners may employ in the cultivation of their plants, that even last year the Dahlia growers found themselves in a position to contribute a creditable exhibition of the various types of their favourite flowers.

The present season affords as striking a contrast to that of 1906 as could well be imagined, and the National Dahlia Society has to hold its exhibition just the same. The judging is taking place as these pages are being sent to press, but our representative at the Crystal Palace, where the exhibition is displayed, is enabled to give us a few particulars through the telephone, from which we gather that the show is likely to give satisfaction, although the quality generally is not of the highest. The entries are about equal to the average, and, consequently, there is a good exhibition.

The winner of the 1st prize in the class for 48 blooms of show Dahlias (distinct) open to nurserymen is Mr. JNO. WALKER, Thame, Oxon., and Mr. W. TRESEDER, Cardiff, has been awarded the 2nd prize.

In the smaller class for 24 blooms (distinct), Messrs. KEYNES, WILLIAMS & Co., Salisbury, have gained the 1st prize, and Mr. GEO. HUMPHRIES, Chippenham, the 2nd prize.

The best exhibit of 18 blooms of fancy varieties (distinct), in the class for nurserymen, was shown by Mr. WILLIAM TRESEDER, and Mr. J. WALKER was 2nd.

The smaller class for 12 blooms was won by Messrs. J. CRAY & SONS, Frome, and Mr. S. MORTIMER, Farnham, Surrey, gained the 2nd prize.

The principal class for Cactus Dahlias called for 18 varieties in bunches of six blooms each, and, in addition to the money prizes awarded, the 1st prize included a Silver Challenge Cup value £15 15s. This has been awarded on the present occasion to Messrs. J. STREDWICK & SON, Silverhill Park Nursery, St. Leonards; 2nd, Messrs. J. BURRELL & Co., Cambridge.

In the section reserved for amateurs, the Silver Challenge Cup offered for 24 blooms of show Dahlias (distinct), has been won by Messrs. WEBB & THOMPSON, Kingswood, Bristol, two amateur growers, who combined to make the exhibit.

Another Silver Cup offered for nine varieties of Cactus Dahlias, in bunches of three blooms each, has been awarded to Mr. W. E. PETERS, St. Leonard's-on-Sea; 2nd, Mr. J. SHOEBRIDGE, East Grinstead.

The Gold Badge, offered by Messrs. Dobbie & Co. for 24 blooms (cactus), has been gained by an exhibit from Mr. J. BRYANT, Salisbury. The money prize in this class was offered by Messrs. J. Cheal & Sons.

Some of the finest flowers in the show were staged in the class for 24 bunches of single Dahlias (nurserymen), the best collection being from Messrs. J. CHEAL & SONS, Crawley (1st prize), and Mr. M. V. SEALE, Sevenoaks.

A Silver Medal was offered by Mr. Edward Mawley for the best bunch of Cactus Dahlias in Classes 6 and 7, and this was awarded to Messrs. G. STREDWICK & SON for a bunch of flowers of the variety C. E. Wilkins.

Non-competitive exhibits included displays from Messrs. H. CANNELL & SONS, Swanley; Messrs. T. S. WARE (Begonias); Mr. J. E. KNIGHT, Wolverhampton; HOBBIES, LTD. &c.

ANSWERS TO CORRESPONDENTS.

BEGONIAS, DAMPING OFF: A. J. C. Your plants are quite free from disease, so far as can be determined from the specimens received. The damping is the result of an excess of moisture. Endeavour to obtain greater vigour in your plants by affording a more generous system of culture.

BOOKS: F. A. S. W. You would find the information required, in an abbreviated form, in *Flowering Plants and Ferns*, Vols. I. and II., by J. C. Willis, M.A., and published by the University Press, Cambridge.

LEVANTINE POMEGRANATES: South Carolina. We are unable to furnish you with the information.

MELONS CRACKING: M. L. If the cracking is not due to the formation of the "netting," it has probably resulted from an excess of moisture in the atmosphere of the Melon pit. More ventilation and a freer circulation of air should be allowed. You will find a note on this subject in our issue for August 10 last, p. 119.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers. FRUITS: C. H. Gooseberry Yellow Aston. J. A. B. Apple Sugar Loaf.

PLANTS: E. B. The Begonia flowers had dropped to pieces. If you think it is a species and not a mere seedling variety, you had better send fresh specimens, with growths attached.—V. W. Holland. 1, Aconitum Napellus; 2, A. rostratum; 3, A. Vulpura.—E. C. W. Crassula sp.—E. M. The yellow flower is Colutea arborescens. We cannot undertake to name the Sweet Peas.—B. S. 1 and 5, varieties of Helianthus; 2, Erigeron speciosus; 3, Cytisus species; 4, Arabis alba (double flowered variety); 6, Achillea Ptarmica (double flowered variety); 7, Veronica spicata.—J. A. W. 1, Probably Daphne pontica, but we cannot determine from leaves only; 2, Cichorium Intybus (Chicory).—S. H. J. 1, Yucca gloriosa; 2, Verbascum nigrum (British); 3, Fuchsia Ricartonii; 4, Olearia Haastii; 5, Veronica "Purple Queen," a garden hybrid.—6, V. salicifolia.—S. Platycodon grandiflorum.—E. B. 1, Hypericum Androsaemum; 2, H. hircinum; 3, H. elatum.—C. & Sons. 1, Pinus Laricio nigricans (Austrian Pine); 2, P. Laricio (Corsican Pine); 3 and 4, Abies nobilis.—A. E. Critchley. 1, Sedum altissimum; 2, S. reflexum; 3, Eryngium amethystinum; 4, Clematis heraclefolia.—J. W. Ptelea trifoliata.—G. W. Linaria repens var. alba.—W. C. Origanum Dictamnus (pink), Chænostoma hispida.—L. E. J. Pentstemon Hartwegii "Newberry Gem."—M. A. T. We cannot undertake to name varieties of Carnations.—W. H. Stenocarpus Cunninghamii.—A. G. 1, Podophyllum Emodi; 2, Anchusa italica; 3, Spiraea Douglasii; 4, Escallonia macrantha; 5, Diervilla (Weigela) species; 6, Leycesteria formosa.—A. M. 1, Arnebia echioides; 2, Abelia triflora; 3, Arbutus Unedo; 4, Lasiandra macrantha.—Talma. Celogyne speciosa.—X. W. Cattleya Dowiana aurea. Cattleya aurea is the usual garden name for this plant, which accounts for your obtaining it as such. Botanically it is a local form of Cattleya Dowiana.—Somerset. Kochia scoparia, a plant extensively grown for market, and for decorative gardening.—J. H. C. Vanda Roxburghii.—I. A. 1, Masdevallia triaristella; 2, Odontoglossum crinitum; 3, Ada aurantiaca; 4, Brassia verrucosa.—J. L., Shrewsbury. 1, Phytgelius capensis; 2, Vitis heterophylla variegata.

3, Prunus Pissardi; 4, Koeleria paniculata.—W. E., Norwood. Statice Suworowi.—A. C. W. Helenium autumnale, variety cupreum.—A. D. Both hybrids of Cypripedium villosum and very near to C. Harrisianum. The Anthurium is the long-spined form of Anthurium Scherzerianum.

NATIONAL CHRYSANTHEMUM SOCIETY: E. C. The Secretary to this Society is Mr. R. Witty, St. James' Villa, Swain's Lane, Highgate, London, N.

STREPTOCARPUS FLOWERS MALFORMED: E. D. The abnormality is due to fasciation or a fusion of growth. The upper flower has become regular, and presents an example of peloria—a common occurrence in many plants that normally produce zygomorphic flowers.

SUMMER BEDDING PLANTS: C. W. H. Flowerbeds filled entirely with one shade of a particular colour are liable to become very monotonous if the beds are of great size. At the same time, if shades of the same colour are employed for obtaining variety, there is a danger of their clashing with each other. For the "Blue Beds" we suggest that you plant in the middle of each, at 3 feet apart, three good plants of Campanula pyramidalis (blue), "Syon House variety," and as a groundwork to these plant light-blue flowered Victoria Asters. At a foot from the edge of the bed plant Salvia patens at distances of 2 feet apart and fill in the spaces between these with dwarf, blue, bedding Asters, finally employing an edging of single blue Lobelia. White Beds. If the specimen is well variegated retain the Acer for the centre and fill in 3 feet wide, from the Acer, with white Pelargoniums. At 18 inches from the edge of the bed put Francoa ramosa at distances of 2 feet apart, filling in the intervening spaces with white Verbenas. An edging of Antennaria tomentosa will be suitable for these beds, but the effect of this dwarf edging may be relieved by planting Echeveria secunda glauca 8 or 9 inches apart. Scarlet Beds. Use a plant of Ricinus Gibsonii or a good specimen of Cordyline australis for the centre and a Grevillea robusta 18 inches inwards from each corner. Edge with dwarf scarlet Begonia semperflorens, and fill the remainder of the beds with scarlet-flowered, tuberous-rooted Begonias. Pink Beds. Plant three or four specimens of Lavatera trimestris (rose pink) in the middle, and pink-flowered Ivy-leaved Pelargoniums, trained as small pillars, at 18 inches from each corner; edge with the same type of Pelargonium pegged down, filling in the remaining space with double-flowered Godetia. If the anchor-shaped beds, in which you require yellow flowers, approximate in shape to the nautical anchor, they are too narrow to admit of many dot plants. Dwarf yellow Antirrhinums would make a good edging and you could fill in with Calceolaria amplexicaulis, placing a good yellow-flowered Canna where the width of the beds will permit of its being displayed to advantage.

TOMATOS DISEASED: E. J. V. Your plants and fruits are badly affected with a disease known as Macrosporium solani. You can do nothing in the case of the fruits and plants already attacked, but you should remove promptly all the leaves and fruits that are seen to be affected. The spread of the disease may be arrested by spraying with the Bordeaux mixture. Burn all diseased fruits and leaves.

VINE LEAVES: F. H. The discoloration of the foliage has been caused by sudden changes of temperature in the vinery. No disease is present: the black-mould is a saprophyte, and occurs only on the dead tissue.

ZALUZIANSKIA MARITIMA: B. H. B. There is but little doubt that this is the plant you purchased years ago under the name of Erinus Lychnidea, for, as stated in Mr. Gumbleton's note on p. 161 of our last issue, the species was formerly known by the latter name, and it was illustrated as Erinus Lychnidea in the Botanical Magazine.

PRESENT DEMAND. FOR BRITISH TIMBER.

THE past season has been one of considerable activity in the timber trade.

The demand has been good, and prices generally have been above the average; indeed, for the best quality Oak, Ash, Sycamore, and Larch wood, prices were perhaps never higher than at the present time. Particularly in Southern England has timber been valuable. Large, clean logs of Oak, situated not too far from means of easy transit, have realised fully 2s. 6d. per cubic foot, and in several instances even that price has been exceeded for exceptionally fine timber produced in Surrey and Sussex. The average value of Oak in the London district would be much lower, and from 1s. 6d. to 2s. 3d. per foot probably represents a fair average. For boat and barge-building on the Thames some splendid Oak timber, the pick of the market, has been supplied during the past season, and the price has been proportionately high. Beech timber, too, has had a steady and profitable market at all prices from 10d. to 1s. 7d. per cubic foot, whilst for the best trees from the chalky

Chiltern Hills or the districts around Boxmoor and the Chenies the demand has been unusually brisk at advanced prices. Larch cannot be procured in the quantities required, nor is it apparent that the supply will increase for many years to come. A considerable quantity of these trees will be felled in Ireland during the coming winter, but little of this timber will be sent to the English market, owing principally to prohibitive carriage rates. The Larch disease is far less prevalent in Ireland than in any other part of these islands, and some Larch trees that I saw lately in the North of Ireland, and growing on reclaimed peat bog, were unusually fine. The trunks rose straight, and with remarkably small taper, for a height of 80 feet, the cubic contents often exceeding 50 feet. Good Larch timber sells readily in England at about 1s. 4d. per cubic foot, but several instances occurred recently when 1s. 6d. was paid per cubic foot for Larch timber of first quality. Railway fencing and similar operations necessitates the use annually of large quantities of Larch wood.

Ash timber is in moderate demand, but there is a quantity of the big, knotty field and hedgerow timber on the market that is only disposed of with difficulty. Thickly-grown plantation trees, whose cubic contents average about a score of cubic feet, is that most in demand, and for which prices range from 1s. 4d. to 1s. 8d. per foot. In Bedfordshire and Buckinghamshire I recently saw some excellent Ash timber.

Large, well-grown Sycamore is by no means difficult to dispose of, at prices ranging up to 2s. 6d. per cubic foot, at which value a quantity was lately sold in Wales. This may be considered the top price, and the general price may vary from 1s. 6d. to 2s. per foot. Small Sycamore, unless for minor works such as turning and clog-soles, has not a great demand. The best logs are required for making calender machines in cotton and jute factories, but they must be of sufficient size for that important purpose. Alder and Birch timber sells readily in some parts of the country for the making of clog-soles: the usual price in the woodland is from 9d. to 10d. per cubic foot. Around Liverpool the demand for these woods for this purpose is considerable. Elm, if of best quality, has a good market, but prices vary greatly, according to the particular district; the difference of price for this wood in two adjoining counties is often remarkable. Trees from the field and hedgerow are not greatly wanted, for they are usually knotty, rough-grained, and ill-suited for the important purposes to which the best quality samples of this wood is applied. Large quantities of Elm planks are used for the making of coffins, for the boarding and flooring of carts, and for the making of furniture. The value, as mentioned, varies greatly; it ranges from 8d. to 1s. 6d. per cubic foot. In Kent, not long since, a large quantity of rough, hedge-grown Elm could not be disposed of at 8d. per foot.

Scotch Pine is to be had in plenty, but the price is not high, the average being 9d. per cubic foot in England, while in Scotland the price is even less. Best timber of Scotch Pine, used for lath-rendering, fetches 10d. per foot in Bedfordshire and several other counties. The wood of Spanish Chestnut

has a fairly ready market if it is clean, large, and free from "cup-shake." Much of this timber is split for park-fencing. The best quality logs realise from 1s. 3d. to 1s. 8d. per cubic foot. Horse Chestnut timber has scarcely any value. Large timber of Poplar realises remunerative prices; 1s. 7d. per cubic foot was paid for a big consignment of this wood near London in the spring of the present year. Poplar wood is useful for the bottoms of store-carts and barrows, being woolly and tenacious, while large quantities are also used for the making of packing cases and for other purposes where lightness is of importance. Lime timber is not greatly in demand, though inquiries were received not long since for suitable trees for the making of musical instruments.

Willow timber, if suitable for the making of cricket bats, finds a ready and profitable market, the price per cubic foot averaging 7s. 6d., though as much as 10s. 6d. has been paid for the same quantity, but the very best of this wood is by no means common. The wood of maiden or unpollarded Willows, of about thirty years' growth, is preferred for bat-making, and such wood has always a demand. Other quality Willow timber, suitable for the making of cart and barrow sides, sell at prices varying from 1s. to 2s. per cubic foot.

The timber of other less plentiful trees, such as Maple, Hornbeam, Walnut, and some of the more recently introduced Conifers, including the Douglas Fir, Austrian and Corsican Pines, have no special value, and are often classed as miscellaneous. In Scotland and Ireland the timber of Spruce Fir sells at from 6d. to 9d. per foot, but it is rarely in great request.

The firewood market has been dull, but will no doubt improve with the rising price of coal. About 5s. per cart load is the usual price for firewood logs, while faggots for fire-lighting may be bought in plenty at 2s. 6d. per 100, and of a larger type for the heating of ovens, at from 14s. to 17s. per 100, according to the quality of the wood and the particular part of the country in which they are offered for sale. A. D. W.

NEW OR NOTEWORTHY PLANTS.

CAMPANULA LONGISTYLA.

THIS fine Campanula, for which Sir Trevor Lawrence obtained an "Award of Merit" at the meeting of the Royal Horticultural Society on August 6, was first described by Mr. A. V. Fomaine in a publication in the Russian and Latin languages issued by the authorities of the Tiflis Botanic Garden, the title of which is Latinised in the *Index Kewensis* as *Acta Horti Tiflensis*. The description, which is in Latin, is in vol. vi., part 3, p. 37, and the author's remarks are in Russian. He states that *C. longistyla* has been confused in herbaria with *C. sibirica*, L. var. *major*, Boissier, *Flora Orientalis*, vol. iii., p. 901, from which it differs in the shape of the drooping corolla and other particulars.

The points emphasised in Fomaine's description of *C. longistyla* are:—Flowers large, violet, nodding. Calyx-lobes lanceolate, spreading, glabrous on the outside, fringed on the margin; appendages strongly reflexed on to the flower-stalk. Corolla bulging at the base and constricted above the middle; style much exerted. Fomaine gives no dimensions, and the following

description has been drawn up from plants raised at Kew from seed received direct from the Tiflis Botanic Garden. Individuals exhibit considerable differences in stature, in habit, and in the size of the corolla. In a small circular bed the plants in flower vary from 1 foot to 5 feet in height, and they are loosely branched from the base.

Biennial, sparingly beset with rough hairs; branches angular. Leaves thick, rough, obscurely toothed, oblong, ovate or lanceolate, rounded at the tip or acute; radical tapering downwards, 3 or 4 inches long; cauline sessile, broad at the base, and more or less clasping the stem; lower ones, 2 to 3 inches long, gradually smaller upwards. Flowers numerous, pendent, violet blue, $1\frac{1}{4}$ inch to $1\frac{1}{2}$ inch long, and wide at the top; stalk, 1 to 2 inches long. Calyx rigid, rough; lobes ciliate, acute, margins recurved; appendages between the lobes oblong, rounded, turned down close upon the stalk. Corolla bulging below the middle, constricted above the middle; lobes broad, acute, slightly recurved. Style club-shaped, longer than the corolla.

Campanula longistyla is a very attractive species; perhaps a little ragged in habit, but its rich violet flowers are sufficient to recommend it. The illustration (fig. 82) represents much larger and more crowded flowers than are shown by any of the Kew plants. It is a native of Transcaucasia, near the eastern end of the Black Sea. W. B. H.

PLANT NOTES.

LAGERSTROEMIA INDICA.

THE genus *Lagerstroemia* commemorates Magnus N. Lagerstroem, a Swede, and friend of the botanist Linnæus. About 23 species belonging to the genus are known to science, and they are natives of Madagascar, Eastern Asia, and Australia. The natural order Lythraceæ to which *Lagerstroemia* belongs is represented in the British Flora by *Lythrum Salicaria*, the Purple Loosestrife, common in ditches and other moist situations.

In the Mexican House at Kew the Crêpe Myrtle, which is the common name of *L. indica*, has recently produced its annual display of crumpled but exceedingly beautiful, rose-coloured blooms, from which it derives its common name. It is a native of tropical Asia, probably of China, and is largely cultivated in India, the Southern States of North America, and most countries where a tropical or sub-tropical climate prevails. In this country it is sometimes cultivated as a greenhouse shrub, although, in the gardens of the south, such, for instance, as at Abbotsbury, near Dorchester, it withstands the winters out-of-doors if protected by a wall.

The species is a strong-growing, deciduous tree, 10 to 25 feet high, with glabrous, light brown bark, and alternate, elliptical, pale green leaves, about 2 inches long, sessile on the branches, and mostly acute. The flowers are produced in open panicles at the end of the long growths of the current season. This circumstance affords an indication of its cultural requirements. To produce long growths and bloom freely it is necessary that the shrub should be pruned hard back in the autumn. The roots should be kept dry during winter. In the spring, in order to encourage the plant to break into growth, it should be syringed frequently. If the new growths be allowed to attain their full length without stopping, each will be terminated in summer by a large panicle of flowers. The normal colour of the blooms is rose-pink, but white, bluish-white and purple forms are known.

In parts of the United States, where the winters are too severe for the Crêpe Myrtle to exist, it is said to be a common practice to lift the plants in the autumn and store them in cellars, planting them out again in the following spring either in glasshouses or out-of-doors. This method does not appear to be practised in this country,

and seems worth the attention of admirers of this beautiful plant, who possibly find the bare stems of somewhat disagreeable appearance when devoid of leaves in the winter. H. Spooner.

FIG. 82.—*CAMPANULA LONGISTYLA*: COLOUR OF FLOWERS RICH VIOLET.
(Pollen grains magn. 300 diameters.)

SENECIO GALPINI.

FOR some years this pretty flowering Senecio has been grown at Kew, but although it is of considerable value for greenhouse decoration, and a plant of easy culture, I have not seen it elsewhere. When out of flower the general appearance of the plant would suggest an Echeveria rather than a member of the Rag-wort family, as the leaves are of a thick, fleshy nature and very glaucous. The flower stems, which reach a height of 1 foot to 2 feet, branch freely, each division being terminated by a round, closely-packed head of bright orange-coloured blossoms. Each head or cluster is more than 1 inch in diameter, and as several are developed at the same time, a well-flowered specimen makes a goodly show, added to which a succession is maintained for weeks together. The flowering season does not seem to be limited to any particular period of the year. The species is a native of the Transvaal, and may be grown in an ordinary greenhouse temperature. W.

COLONIAL NOTE.

EMIGRANTS IN NEW ZEALAND.

I NOTED in the issue of the *Gardeners' Chronicle* for May 11 a letter from a gardener in Auckland, in which he warned others not to come to this colony. In Dunedin there are a few openings for good men, but there are no large private gardens here and very little glass. I would not advise anyone either one way or the other, but may state that, whilst resourceful, pushing men may succeed here, duffers have less chance than in England. Employers have to pay good wages and must, therefore, have good men. In the gardens and reserves here we pay labourers 8s., gardeners 8s. 6d., and foremen 9s. per day of eight hours. Jobbing men in town charge 9s. and 9s. 6d. per day, and there are only a few good ones. I would like to mention the benefit gardeners out here derive from the *Gardeners' Chronicle* and other gardening papers received from England. The details concerning the "Week's Work" in "Public Parks and Gardens" and "The Flower Garden" are particularly interesting and they keep us up to date. David Tannech, Superintendent of Gardens and Reserves, Dunedin, New Zealand.

THE ROSARY.

ROSE DOROTHY PERKINS.

AMONG Rambler Roses this is one of the best for clothing a fence, wall, or unsightly object. As with climbing Roses in general, plants under three years old transplant more successfully than older plants, and are capable of making a good display in less time. The plants should be obtained in October or early in the following month. As it is always advisable to trench the soil for Roses; and allow time afterwards for the settling of the soil before planting is commenced, the work of trenching should be undertaken in the present month. If the trenching is three spits in depth, place about a 4-inch layer of rich manure, not greatly decayed, two spits deep, say 18 inches; and if the trenching should only permit of two spits being taken out, put the manure at the bottom after loosening the base with a digging fork or mattock. A small quantity of weak manure should be mixed with the top spit in each case. See that the Roses when they come to hand do not suffer from dryness at the root, and after cutting back the strongest roots a little, dip all the roots into a puddle of clay and water, adding a little cow-dung if this is procurable. In planting a Rose-tree spread out the roots in all directions, and cover them with some of the finer soil; partially fill in and make firm with the feet, then complete the filling-in and again

make the soil firm. In planting these climbers and any Roses that are not growing on their own roots, bury the point of union of Rose and stock 2 inches deep, and those on their own roots a very little deeper than when they were growing in the nursery. If the soil be dry at the time of planting afford the plants a good soaking with clear water; and before hard weather sets in, apply a strawy mulch over the roots. Cut back the plants to 5 or 6 inches in the following April, and encourage growth in after years as much as possible.

ROSA SETIGERA (THE PRAIRIE ROSE).

As an ornament for the shrubbery, this species and those derived from it are hard to beat in regard to rapidity of growth and freedom of flowering, and they are all excellent plants for covering rockwork, rough walls, and fences. They are unsatisfactory if planted in shady spots, and what shelter is afforded them against the wind should be as distant as is consistent with the object in view, viz., shelter. The soil must be well drained if naturally wet, and it should be rich and of good depth. In pruning these and most climbing Roses, it is sufficient to cut away all dead, dying, and weak shoots, and to cut back the previous year's growth far enough as to obtain two or three strong shoots. Weak plants should be cut back severely, and encouraged to make stronger shoots by applications of rich manure. F. M.

VEGETABLES.

EARLY VARIETIES OF PEAS AND BEANS.

DURING seasons like the present, and especially in the colder parts of the country, the great value of early types of vegetables is more than usually apparent.

I should like to add my testimony to that of Mr. Divers (p. 114) as to the distinctive qualities of that excellent new Marrowfat Pea Laxtonian. It is a very productive variety, with fine pods well filled with Peas which are dark green in colour and of excellent flavour. Chelsea Gem, an old favourite, sown on March 1, 25 days in front of Laxtonian, was only ready for consumption two days before Laxtonian, which would probably have beaten Chelsea Gem by a week had the varieties been sown at one time. Laxtonian with me has grown to a height of 3 feet, but Peas here generally go to a greater height than they do in most soils, and this year all varieties have grown well above the usual heights.

There is a distinct advance in the case of Broad Beans in the variety "New Extra Early." Sown with the "Early Long Pod" on March 1, the new variety came into use a fortnight in advance of the rest. This variety is of the broad, short-podded type; the pods are well filled, and the Beans are of good size and flavour. Its constitution must be excellent, for it grew well under most adverse circumstances as regards weather, and in a very cold soil. J. C. Tallack, Shipley Hall Gardens, Derby.

CHRYSANTHEMUMS IN THE U.S.A.

In *The Florists' Exchange*, of June 22, 1907, appeared the substance of a paper on the Chrysanthemum, read before the Boston Gardeners and Florists' Club by Mr. Charles H. Totty. He stated that the first seedling Chrysanthemums raised in America were exhibited before the Massachusetts Horticultural Society in 1879 by Dr. H. P. Walcott.

Peter Henderson, previous to this, had imported from Japan in 1863 some fine varieties, one of which at least, grandiflorum, was grown until very recently.

The American Chrysanthemum Society was not organised until 1889, but shows had been held for some time previous to that in the larger

eastern cities. Possibly the greatest enthusiast this country ever had is the veteran John Thorpe. Another gentleman who, although his name does not figure so much in print, did a great work in the early days, is Wm. Barr, of Orange, N.J., who is just as keen to-day in testing new kinds as he ever was.

In the early '80's, several Pennsylvania cultivators came to the front. W. K. Harris and H. Waterer left their imprint on the Chrysanthemum by raising some fine varieties. New Jersey was represented by T. H. Spaulding, and the firm of Pitcher & Manda; and two others deserving of mention as having done good service are Messrs. Fewkes and Hallock.

The Australian varieties in the past few years have swept our exhibition tables clear of the older varieties, giving us flowers of such splendid size and colours, combined with ideal habit, that there would almost seem to be an infusion of new blood into the race. The French and English seedlings are in too many cases disappointing to us, comparatively few standing the test of our climate, but the failures in the Australian varieties are few. The reason for this is because the Australian climate at flowering time is similar to ours, often warm and bright, and if a seedling shows a large, full, perfect flower in this condition, it will do the same with us. An English variety may be splendid in its native home, and yet be a failure here, showing an enormous eye, and only some five or six rows of petals. Some of the finest varieties act in this way here, including Lady Conyers, Elsie Fulton, Mrs. F. W. Vallis, which are good examples. The Australian varieties, on the contrary, succeed much better than they do in Europe; the bright sunlight here in the fall serving to bring out the size and breadth of the petal to greater advantage.

We should never lose sight of the fact that the Chrysanthemum is almost a hardy plant, and indoor culture is an unnatural condition, which in time tends to produce degeneration in the parent stock. The future will, possibly, see a race of American seedlings equal or superior to what we are now getting from Australia; but they will be raised out-of-doors somewhere in the great south-west. I am often asked how it is that the Australian types are such strong growers, splendid in both stem and foliage. Perhaps the chief reason is because in Australia they practice an out-door system of culture. Another reason why the Australian varieties are all good growers, lies in the fact that a rigid selection is kept up from the seed bed to the flowering stage. Any plant that shows an exceptionally tall, or a weak, spindly habit is destroyed before the plant reaches the flowering stage, so that the temptation to keep it, should it prove to be an exceptionally fine flower, is removed. This, I am informed, is the policy of Mr. Pockett, of the Wells-Pocket firm, and I say to-day that this firm, if they do not send us another variety, have left a mark on American Chrysanthemum culture that will endure for many years to come. The more popular type of flower at the present day is the Japanese incurved. The true Chinese type with its incurving petal is apparently too small for present-day taste, and is entirely crowded out of the commercial growers' list.

As regards the future, the author of the paper said, "Changes will come unquestionably; in fact, they are already looming up. It is seen in a reaction in some sections from the large blooms, and in the increasing popularity of single flowers, not only in Chrysanthemums, but also in Roses, Dahlias, and other flowers. Light, graceful, natural effects can be produced, impossible of duplication with the large, double flowers. Several new singles were awarded certificates in London last fall.

"The Pompons or hardy types will be planted much more largely in the next few years.

"For large, massive decorations the big flowers are unsurpassed; to make a display in an exhibition they are indispensable, and as evidence of cultural skill they tell their own story. That new types will crop up and have a share of the popularity is certain. The large flower, in its proper place, has a certain nobility that is not, to my mind, approached by any other flower, but its proper place is not in a low bowl to form part of a dinner-table decoration. That part of decorative art can be more artistically done with singles or Pompons or other small-flowered varieties."

ASTON ROWANT HOUSE.

ON one of the closing days of July we had the privilege of visiting the residence of Sir William and Lady Plowden, at Aston Rowant House, in Oxfordshire, and found there such a display of Roses and hardy flowers, including Japanese Irises, as would delight anyone having an appreciation for these plants. Aston Rowant is a railway station 40 miles from London, and may be reached by train either from Marylebone or Paddington. The passenger travels by ordinary train to Princes Risborough, and afterwards upon a short branch railway, consisting of a single track. Either route is interesting, and when Aston Rowant is reached, the district is of the most rural character.

The east front of Aston Rowant House may be seen in the illustration at fig. 83. Directly the visitor reaches the residence he becomes aware of the great amount of care given the garden, and of Lady Plowden's appreciation for floral

this point the chief attraction was the Crimson Rambler Rose growing and flowering splendidly on wires attached to, and depending from, pillars. The collection of 120 varieties of climbing Roses at Aston Rowant are trained on three fences, 14 arches, and one long pergola, and in some instances the Roses are interspersed with Clematis Jackmannii varieties. On one high fence, clad with Roses on either of its sides, we were particularly impressed with the beauty of the following varieties among many others:—Madame Plantier (white), Aimée Vibert, Gardenia (yellow in the bud, but opening into a large, semi-double flower of lemon colour which subsequently passes to white), Francois Crousse (rich crimson), Myrianthes, Leuchtstern (a single flower, pink with white centre, produced in immense clusters), Triomphe de Rennes (a very late blooming variety that is never so effective as in September), Mrs. O. G. Orpen (a very large single, pink flower, but a plant possessing a somewhat restricted habit of

Many more varieties might be mentioned did space permit, but even then it would be impossible to convey to readers an adequate idea of the gorgeous effects many of these Roses are capable of producing when grown strongly, and kept clean and healthy as the plants appear at Aston Rowant. Rambler Roses are notorious for their habit of flowering for a brief period only, but there are so many varieties obtainable that it is easily possible to so furnish a pergola or fence that the first flowers will open in June, and the last in October. Lady Plowden's collection is one composed of all the best varieties.

A very noteworthy feature in these gardens consists of three long flower borders, each about 300 feet in length. The first extends under the shadow of one of the garden walls, on the outer side; the second, parallel to the first, but divided from it by a grass-covered path; and the third also parallel and divided from the second in the same manner, and by a similar path.

[Photograph by Lady Plowden.]

FIG. 83.—ASTON ROWANT HOUSE, OXFORDSHIRE, THE RESIDENCE OF SIR WILLIAM AND LADY PLOWDEN.

displays, especially of Roses. This is evident in the manner in which these latter plants are cultivated in all available situations, even up to the front doors of the building. Standing with one's back to the creeper-clad house, the view over the grounds into the far distance, where it is effectively intercepted by the Chiltern Woods, is very gratifying. Three of the permanent features close to the front are a fine old Beech tree, a grand Cedar, and an ancient Yew of considerable dimensions, and which has probably stood there since the middle of the 17th century. The low terrace boundary, at the time of which we are writing, was clad with profusely-flowered plants of several varieties of Rambler Roses, as Blush Rambler, Hiawatha (one of the most charming of single Roses), and others. Some bright flower-beds lit up the lawn with patches of well-toned colour, and beyond

growth), Lily Ito (a new variety not then in flower, but promising well for a later display), Debutante, and Flora. Other varieties noticed in various positions were Dorothy Perkins (not then at its best), Mrs. F. W. Flight, Wedding Bells, Waltham Bride, Trier (an effective white variety with anthers of glowing yellow), Rubin, Lady Gay, Ards Rover (passing out of bloom, being one of the earlier varieties to flower), Papillon (a very distinctly coloured Rose, bearing shades of cherry-red and salmon), Reine André (pink and white, each flower being of moderately large size), Elisa Robichon (of delicate flesh tint), Euphrosyne, Soliel d'Or (a dwarf-growing Rose with fine yellow flowers), Jersey Beauty (of very fugitive character, but possessing large single flowers of sulphur colour), Helene, and Lord Penzance's hybrid Briars in variety. The Briars were growing on a fence to the height of 14 feet.

The excellent choice and disposition of the plants in these borders and the high cultivation afforded them is a striking testimony to the skill of the gardener in charge, Mr. W. H. Clarke, and to his capacity for "taking pains." We have never seen a better instance of border gardening, and the whole has been planned and carried out by the present gardener, as have several other important features that go far to make up the attractions Aston Rowant now possesses. The Pentstemons, Galegas, Dahlias, Phloxes, Michauxia campanuloides (4½ feet in height), double white Winter Stocks (put out into these borders from boxes), and an infinite variety of suitable plants, most of them valuable for producing flowers of a type that can be put to good decorative service in a cut state, are cultivated on these borders as perfect specimens. The intervening spaces between the permanent

herbaceous perennials are filled with thousands of seedling plants raised specially for the purpose, and that are capable of flowering well in the first season, whether of only annual duration or otherwise.

Sweet Peas, as in most other gardens, are grown numerous, and with greater care than was given Sweet Peas some years ago. A few circular groups of these in round beds, each group exhibiting one variety only, were of extraordinary proportions, the height and vigour of the plants being at once noticeable, but the staple soil of this garden, not being of the best, it had been removed 4 feet deep in this case, and good soil and much manure substituted for it.

It may be interesting to remark that in respect to the Dahlias, Lady Plowden does not favour their flowering before the month of September. She associates them peculiarly with autumn, and any blooms that appear on the plants before September 1 are removed whilst their potential beauties are still undeveloped.

situated in a low-lying portion of the park, and one that is shaded in more or less degree by tall-growing forest trees. We should expect the crops to be less in bulk and inferior in quality to those that might otherwise have been secured with the same amount of cultivation as the trees now require at the hands of the gardener.

There are the usual fruit houses necessary on such an estate, and their management leaves nothing to be desired. The Peach trees are in capital condition, and have borne heavy crops of fine fruits this season. Fruits of Early Rivers Nectarine, for instance, have weighed 12 oz. and 13 oz. each. Goldoni Nectarine, though not usually considered first class, is grown here of such a quality as meets with considerable appreciation.

At the commencement of this note we alluded to the Japanese Irises, and we may refer to them in conclusion. Lady Plowden has herself brought most of them from Japan. They have been introduced under native names, and are cultivated along the sides of the water shown

was obtained from the Continent, whence it had been introduced from Japan, its native country. I planted it in an open and sunny situation, where it blooms freely. Its flat cymes of yellow flowers are seen to advantage, and appear bright among the other flowers from July onwards. The leaves of *P. gibbosa* are swollen or blistered in parts, and these are the least attractive feature of the plant. My plant grows to a height of about 9 inches.

CAMPANULA "CHINA CUP."

AMONG the most satisfactory of the dwarfed Bellflowers for garden purposes are the forms of *Campanula carpathica*, and which are among the most valuable subjects for the decoration of the border or the rock-garden. Some cultivators experience a difficulty with the form called *turbinata*, and declare it to be not so enduring as some of the others; but this is not the experience of the writer. It is, however, of smaller stature than the majority. One of the newest and most delightful of these forms of *C. carpathica* is that known as "China Cup," a variety sent into commerce by Messrs. Barr & Sons a few years ago, and which I acquired on its introduction. My plant is now almost 2 feet in diameter, and it is very beautiful on one of my rockeries. The flowers are not so freely borne as on some of the other varieties: they are large, about 2 inches across, a good shade of blue, and the form is of a broad, open cup, with reflexed margins. These flowers are well raised on erect stems, and the whole effect is pleasing. *S. Arnott, Dumfries.*

TREES AND SHRUBS.

CALOPHACA WOLGARICA.

IN Scotland this Siberian plant is but rarely cultivated, although it was introduced so long ago as 1780. Probably the largest specimen in Scotland is a plant growing on a western wall in the Comely Bank Nurseries of Messrs. Cunningham & Fraser, Edinburgh, where it annually produces its velvety, pale, yellow-coloured, Pea-shaped flowers throughout July and August. The flowers are borne in racemes on short stalks in the axils of the pinnate leaves, which have six to seven pairs of orbicular-shaped leaflets. A slow-growing, much-branched, hardy deciduous shrub, this specimen is fully 3 feet high, and produces annual shoots averaging 6 inches in length, on which the flowers are borne. Loudon, in his *Arboretum et Fruticetum Britannicum*, mentions that the *Calophaca* forms an attractive plant when in fruit, as the flowers are succeeded by reddish-coloured pods, but the climatic conditions near Edinburgh are not sufficiently favourable for the legumes to mature. Propagation of the *Calophaca* is usually effected by grafting on stocks of the *Laburnum*, but it may also be increased by seeds, which are catalogued by some of the Continental nurserymen. *Wm. Smith, Royal Botanic Garden, Edinburgh.*

CAMPANULA PETRÆA.

THIS little-known *Campanula* (see fig. 84), which was given to me by a friend, has bloomed well with me this summer. It is exceedingly free-blooming, for, besides the terminal bunch of pale yellow flowers which are well shown in the illustration, a small subsidiary bunch appeared at the axil of every leaf. Of these I counted no fewer than thirty-two on the branch from which the illustration has been prepared. Owing, however, to the almost total absence of sunshine, and the frequent rains, many of these did not open their flowers. The plant is figured by the great German authority, Reichenbach, both in his *Flora Germanica*, vol. xix., t. 1,595, and in his *Icones Criticae*, vol. vi., t. 571. The plant, being a biennial, dies after flowering. *W. E. Gumbleton, Belgrave, Queensland.*

FIG. 84.—*CAMPANULA PETRÆA*: COLOUR OF FLOWERS PALE YELLOW.

Single flower and stamen $\times 4$; pollen grains $\times 300$.

There is the inevitable "wild" garden, where the cultivator, though as persistent as in other portions of the garden in his care for particular species, nevertheless screens the evidences he might leave of his work, and so produces an effect that is less artificial in character than the gayer portions that visibly advertise themselves as the result of art.

Some of the rarer and choicer trees and shrubs have been planted in various positions in the pleasure grounds during recent years, and these will become more and more effective for some considerable time to come. These include flowering species as well as those which are cultivated solely for their beauty of form and foliage. A specimen of *Sophora pendula*, about 9 feet high, showed itself to be a lawn tree of distinct appearance, and therefore valuable for occasional planting to give relief to others in a collection.

Most of the fruit trees are planted together in an area of about 2 acres, which is protected from birds by wire netting. This orchard is

in the illustration. They were beautiful at the time of our visit, being in excellent health, and flowering most freely. Some of the varieties were charming in the shades of colour they presented, and the flowers themselves were of very large size. Details of the cultivation they have been afforded may be found on reference to an article on the subject written by Mr. Clarke and published in our issue for May 20, 1905, p. 308.

THE ROCK GARDEN.

PATRINIA GIBBOSA.

OF the ten or a dozen species of *Patrinia*, a genus belonging to the Natural Order Valerianaceae, a few only are represented in British gardens. I have had in my garden for a considerable number of years *P. gibbosa*, and although the flowers of this species individually are small, yet they are numerous produced, and the range of flowering extends over a long period. My plant

THE BULB GARDEN.

GLADIOLUS SAUNDERSII AND G. PRINCEPS.

GLADIOLUS *Saundersii*, although it was introduced into this country nearly forty years ago, is rarely seen in gardens. One reason for this, probably, is that its habitat being in South Africa, it is considered too tender for open-air culture. As a matter of fact, it appears perfectly hardy, never being given the slightest protection, and coming up stronger each year. A large clump with thirty or more flower-spikes is a glorious sight towards the end of August. The spikes reach a height of 3 feet 6 inches, and the flowers, three of which are expanded on a spike at the same time, are very handsome. In colour they are a light shade of scarlet, the three lower segments having a white centre plentifully spotted with vermilion. The upper petal, which is lance-shaped, is inclined forward, and the side petals are much reflexed, the expanded blossoms measuring rather more than 3 inches across. If the petals, however, are stretched out the flower will measure 6 inches. Considering its hardiness, beauty, and the attractive form of the flowers, it is a pity that this *Gladiolus* is not more widely grown. It is a far more reliable garden plant in the south-west than *Gladiolus princeps*, which has proved a very bad doer in many places, although described as being perfectly hardy when first sent out. Here it entirely died out, and of a dozen bulbs procured this spring and planted in good soil, only four have flowered, six being apparently dead. In another garden, a few weeks ago, I saw where two dozen fine bulbs of *G. princeps* had been planted. All that had appeared above ground were several weak leaf-growths, none of which would bear bloom. *G. princeps* has proved a very disappointing plant, and its culture has in consequence been given up in many gardens. *G. Saundersii*, on the contrary, gives no trouble, increases year by year, and always flowers magnificently, so that it can be strongly recommended to take the place of *G. princeps* where that plant does not succeed. *S. W. Fitzherbert, Devonshire.*

MARKET GARDENING.

NOTES FROM WORTHING.

TOMATO plants were, as usual, allowed to develop four or five internodes above the point where the first flowers appeared, but, owing to the poor prospects of the later fruits maturing, the plants have been shortened to a point immediately above the second, or at most the third, fruit truss.

Houses are being prepared for planting Cucumbers at the middle of September. Royal Kidney Potato was being lifted, and the crop was an excellent one. The variety Sir John Llewelyn had tubers of the first quality, but the yield was light.

Warner's King, Ecklinville Seedling, and Cox's Pomona Apple trees are carrying the best crops for several years past.

IVY ARCH NURSERIES.—Gros Colmar Grapes in these nurseries were of fine quality. A few bunches of Black Alicante averaged 3 lb. each. I was informed that all through the season bunches of Muscats of Alexandria weighing 2 lb. and upwards were in demand. From this nursery is sent away 50 to 100 bunches at a single cutting.

NEWLY-PLANTED VINERIES.—Houses of both Gros Colmar and Black Alicante vines, some of which were planted in 1906, and others this season, were doing well. Tomatos are accommodated in the vinery the first season, but when the vines are two years old, only half the quantity of Tomatos is planted, in order that the rods should have room, not only to grow, but also to mature. Invariably these vines in the second year, and in some cases the first year, are trained with double rods. *Stephen Castle.*

The Week's Work.

THE FLOWER GARDEN.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Border Carnations.—The season has been very favourable for the rooting of layers, and shoots that were prepared at the beginning of last month may now be lifted and planted in their winter quarters. A dull day should be selected for this operation, and the young plants are better if they are planted somewhat deeply. Make the soil about them as firm as possible, and it will be well to secure the shoots from damage by rough winds. This may either be done by tying them to short sticks or by placing three sticks close around each plant. Marguerite and perpetual-flowering Carnations should be tied to neat stakes, and while they are in flower it is advisable to protect them in some efficient manner from wet and frost. This protection should be of a temporary nature, so that it may be removed on all favourable occasions.

Lavender.—After five or six years from the planting of this shrub, the quality of the flower-spikes begins to deteriorate, so that it is necessary to periodically make new beds. This may be done by laying shoots about 4 inches in length, and with a heel attached, in rows in a nursery-bed. Bury about half the shoot and tread the soil covering them firmly. Roots will form during the autumn and winter, and at this time next year the plants may be placed in a bed at 18 inches apart, ultimately removing every alternate plant before the plants become crowded. The Lavender thrives best in a light and rather poor soil.

Lawns.—Showers and heavy dews will now hamper the work of grass-mowing; therefore, as a rule, wherever the grass is sufficiently dry, the lawn-mowers should be kept at work. The sun's rays being less powerful at this season, all danger of the grass "burning" is over, and the mowers should be gradually adjusted so that they cut the grass shorter. The turf around trees should be frequently clipped in those places where the mower does not reach it.

Late-flowering Tulips.—Darwin, Cottage, Parrot, and many species of Tulips require a longer period of growth than the ordinary bedding kinds. They should therefore be planted as early as possible after this date. Home-grown bulbs should first be cleaned and sorted; any outer scales that are at all imperfect should be rubbed off. These Tulips should be planted closely together, and in heavy soils, at about 4 inches deep, but if the soil is light they may be planted slightly deeper. Most late-flowering Tulips succeed well when grown under partial shade and under conditions suitable for the smaller Fritillarias, which should also be planted at the present time.

THE HARDY FRUIT GARDEN.

By J. MAYNE, Gardener to LORD CLINTON, Bickton, East Devon.

Gage Plums.—Plum trees generally this year are yielding good crops of fruits, and choice varieties of wall trees, including Reine Claude de Bavay, Guthrie's Late Green, Jodoigne Green Gage, Golden Transparent Gage, and Late Orange should be covered with either hexagon netting or the proper wasp-excluding hexagon supplied by most horticultural sundriesmen. Isolated fruits can be tied up in muslin, or some similar material, but these bags sometimes cause the fruits to decay, especially during dull, wet weather. Coe's Golden Drop forms an excellent dessert Plum if it is allowed to thoroughly ripen on the tree; the fruits should be protected from wasps and flies.

Pears.—The variety Williams' Bon Chrétien is now ripening, especially on trees occupying a warm position on a wall. Early ripening varieties of Pears should not be gathered in bulk; the trees should be examined for ripe fruits at intervals of a few days, and any just turning ripe should be placed in the fruit room or some other suitable place where they will finish ripening in a few days. Beurré d'Amanlis and Autumn Nelis are two good varieties of Pears suitable for early autumn use. The green, melting flesh of the former variety has the highest flavour when grown against a warm wall.

Preparations for planting.—If an extensive planting of fruit trees and bushes is to be undertaken this autumn, the ground should be trenched, and given what manure is necessary as soon as possible. This will allow plenty of time for the soil to settle before the work of planting is carried out. It is well to have ready some suitable soil for placing amongst the roots. This should consist of a mixture of fibrous loam, lime, soot, and wood ashes. Mortar rubble and old plaster may be substituted for the lime. All trees bearing stone fruits should be given some of this compost at planting time, and I find Apple and Pear trees also benefit by its presence. The heap of soil awaiting use should be protected from heavy rains by spare sashes or doors thrown over the top. When planting Gooseberry and Currant bushes, some partly-decayed manure should be used in addition to the new soil, especially if a few only are to be planted or gaps merely made good.

THE KITCHEN GARDEN.

By WILLIAM H. HONESS, Gardener to C. COMBE, Esq., Cobham Park, Surrey.

Cauliflowers.—The plants raised from the earliest sowings should now be large enough for pricking out. For late districts these will probably be the most satisfactory, but they may prove too early for more favoured localities, in some of which it would not be too late even now to make another sowing for forming a gradual succession, if not the main supply. In all cases these and similar plants should be transplanted as soon as they are large enough to be handled conveniently. This will ensure their making a sturdy growth previous to being placed in their permanent quarters.

Tomatos.—The out-door crop is very backward, and the earliest fruits have only now finished swelling. To hurry the development of the later fruits the plants had better be stopped harder than is usual. If some old glass lights can be placed in front of the plants, or even a covering be provided at night-time, using any light shading material for the purpose, some good will result. If rains are frequent when the fruits are ripening, insert the spade into the soil at a distance of about 18 inches from the main stem, and by severing the roots thus counterbalance the excessive supply of moisture, which would be likely to cause the fruits to crack.

Parsley.—Where it is necessary to afford shelter to Parsley throughout the winter, it will be well to lift some of the plants raised from sowings made in July and plant them out in unheated frames, keeping the lights off until severe weather sets in and protection becomes necessary. The plants will then grow strong and hardy, and if air be afterwards admitted freely on every favourable opportunity, the plants will be less likely to suffer from damping.

Onions.—The spring-sown Onions, including those that were raised in boxes or frames and were subsequently transplanted to beds in the open garden, and that, having been lifted, have become well dried and ripened through exposure to the sunshine, should now be stored in a light, well-ventilated shed until a more convenient time, when it will be necessary to tie them up into bunches or ropes. The matter of thoroughly drying and ripening Onions is a very important one, especially where the bulbs are required to last in good condition through the winter and well into next spring, for unless the drying is done thoroughly decay is sure to set in at about mid-winter. As regards the tying together of the bulbs, we find that tying them in bunches of from 12 to 20 bulbs each is more convenient and economical than roping them, but this, of course, is a matter of opinion.

Coleworts.—Make the final plantations of Coleworts without delay, and fill all blanks that have occurred in the earlier plantations.

Endive.—Further plantations of Endive should still be made in order to provide for successional crops. Sufficient plants may be left in the seed bed to form a crop on that ground, for these will be found to succeed equally as well as those that have been transplanted therefrom to other quarters.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Odontoglossum crispum.—Plants of this species and its numerous varieties that flowered early in the year, and which were repotted soon after that time, if they are still in a healthy condition, will require no such attention now, but any plants which have deteriorated should at once be turned out of their pots, have their roots well washed, all decayed parts cut away, and be potted anew. Afford them fresh pots sufficiently large enough to accommodate them for one season only. Plants that flowered later in the season are now growing freely, and the new growths will be pushing out numbers of young roots; the present is therefore a suitable time to examine such plants, and to afford any which require it some fresh rooting-material in clean pots. Some plants, perhaps, are only now commencing to grow; the potting of these should be left until the more forward specimens have been given attention. When repotting, turn the plants carefully out of their pots, and cut away all useless back pseudo-bulbs, it being necessary only to leave two pseudo-bulbs behind each leading growth. This will necessitate the removal of the greater portion of the compost at the back of the plant, but unless the old soil has become sour or decomposed under the leading growths and where the principal young roots are found no more of it should be disturbed than is absolutely necessary. In the majority of cases, when treated in this manner, the plants may be repotted into pots of the same size as they have previously occupied. The receptacles should be made clean and dry, and they should be provided with material for drainage to one-third of their depth, using broken crocks, and placing the larger pieces at the bottom, covering the whole thinly with rough sphagnum-moss.

Compost for Odontoglossums.—A suitable compost for *Odontoglossums* consists of good fibrous peat and sphagnum-moss in equal proportion. These should be mixed together in a rough condition, and afterwards be cut into small pieces, but not too fine, with a strong pair of shears, adding sufficient crocks to ensure porosity. A mixture of *Osmunda* fibre and *Polypodium* fibre in equal parts may be used with equally good results, provided it receives the addition of moss and small crocks, as previously advised. I have entirely discarded the use of leaf-mould as a rooting-medium for these plants, as, after considerable experience, I find that its durability is deficient when compared with the other materials I have just mentioned; also that when grown in the leaf-mould mixture, the pseudo-bulbs shrivel more quickly under the strain of flowering, and the flowers do not retain stability nor freshness, when cut, so long as they do when grown in the composts recommended above. When preparing the moss for use, and in clearing it from leaves and rubbish, search for slugs, and if any are found it will be advisable to place the moss in water, and wash it thoroughly, so as to cleanse it from these pests or their eggs, which are almost imperceptible to the naked eye.

Potting.—Pot the plants with moderate firmness, and have the base of the pseudo-bulbs level with the rim of the pot. When the potting is finished, prick in a few pieces of living moss over the surface of the compost. For a few weeks after repotting, it is advisable to afford water sparingly, and sufficient only to favour the growth of the sphagnum. A moist atmosphere should be maintained, by syringing between the pots both morning and afternoon. Admit plenty of fresh air, especially when the weather is mild and damp. Shade the plants from direct sunshine at all times. It is impossible here to enumerate all the different species of *Odontoglossums* and their numerous hybrids, but among them will doubtless be many plants requiring similar treatment at the present time as advised for *Odontoglossum crispum* and its varieties.

PLANTS UNDER GLASS.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Chrysanthemums.—The earliest-flowering varieties of those grown in pots for the decoration of the conservatory or other plant houses should be removed to positions under glass before the

blooms have fully opened, or they may be damaged by frequent showers. If the weather is bright after the plants have been housed, they had better be afforded shade from the sunshine during the hottest part of the day, and it will be necessary to damp the stages and paths. The blooms will be better and last longer if kept as cool as possible. The main batch of *Chrysanthemums*, grown for the production of large blooms, need very close attention. The "taking" or selection of buds for developing blooms, the tying of shoots, and the removal of superfluous shoots are important details. The affording of necessary manures should be strictly attended to, in order to get the best blooms possible. An occasional change of manure is beneficial, but most gardeners have their particular preferences in this respect. In any case, cultivators should be careful to avoid applying manures in too strong a form at any particular time. Be quick to discover the presence of any pest, whether insect or fungoid, and adopt preventive measures as often as necessary. As soon as the earlier blooms begin to show colour, place such plants under glass at once, or the outer florets of the blooms will suffer damage. Bush plants grown for use as decorative plants or for supplying blooms for cutting should have the shoots staked well out, so that each may be exposed to the sunshine, and for the same reason the plants should be arranged together somewhat thinly. These details are especially important in respect to the varieties that will flower at about Christmas-time.

Perpetual-flowering Carnations.—The flower-buds on the earliest plants that are grown for flowering in winter will now be getting into a forward condition, and no time should be lost in housing them. If allowed to remain outside after they commence to show colour, the blooms are never so clean and free as when developed under glass. Thoroughly wash the interior of the house before removing the plants. Attend to the details of tying and disbudding, this latter operation being essential if the finest blooms are desired. Arrange the plants thinly on the stage, and fumigate the house at the first opportunity, to get rid of any fly that may be lurking unseen on any of the plants. If, after housing, any hot weather is experienced, it will be advisable to use the blinds for an hour or two in the day, and to give the plants a slight spraying with the syringe late in the afternoon; this will have an effect similar to the night dews to which the plants are accustomed when out-of-doors.

General work.—Dull and damp weather being the rule this season, shading should be dispensed with as much as possible, affording a little extra ventilation on all suitable days in order that the growth of various plants may become hardened before winter. In the next few weeks gardeners will be very busy housing the plants that have been grown out-of-doors during the summer, but which must be removed to a safe position before frost occurs. There is no gain in leaving everything to the last week, therefore look around the houses to see what may be thrown out, or stored away for the winter. Get the interior of the houses washed and disinfected from insect and fungus pests. When housing the plants give as much room to each individual plant as can be spared, remembering that one good plant is worth more than several poor ones, which are the results of overcrowding.

FRUITS UNDER GLASS.

By ALEXANDER KIRK, Gardener to J. THOMSON PATON, Esq., Norwood, Alloa, Clackmannanshire.

The vinery.—Vines from which the fruit has been gathered should be syringed each afternoon to prevent attacks by red spider, for it is essential that the foliage should remain healthy as late in the season as possible. Do not allow the borders to become either dust-dry or saturated at this season. An application of liquid manure is valuable at this stage, for it assists in building up the buds and aids the maturation of the wood. Vines that are making gross growth should not be given any stimulant. Young vines, which were planted in the borders in March and June, will continue to grow vigorously as long as the conditions for growth are favourable. The atmospheric temperature of the house at night should be 65°, and by

day (allowing for an increase with sun heat) 85°, but on dull days the temperature need not exceed 70° to 75°. Maintain plenty of moisture in the atmosphere. Should red spider appear syringe the foliage each afternoon. Test the border for its condition of moisture, for it must not be allowed to become dry. As soon as the leading shoot reaches the top of the trellis, pinch out the growing point. Tie in the lateral shoots if growth is weak, but if it is gross pinch the side shoots at the first leaf. Maintain artificial heat in the house at night-time, but always allow the top ventilators to remain open a space of 4 inches. In order for the canes to thoroughly ripen, a free circulation of air must be allowed, and the top and the bottom ventilators opened daily when the weather is favourable.

The Orchard house.—All trees that have been cleared of their fruits should be placed out-of-doors and be plunged to the rim of the pots in coal ashes. Apply water to the roots cautiously; an occasional dose of manure-water will be of benefit to the trees. Later varieties of Pears in pots, including Pitmaston Duchess, Doyenné du Comice, and Marguerite Marillat should have their fruit secured by soft matting or twine wound around the fruit-stalk and affixed securely to the branch or shoot.

Strawberries.—Plants that were potted finally last month are now rooting well and making strong leaves. Apply manure-water to the roots occasionally. Remove all runners as they appear. See that the plants have ample room to receive the full benefit of light and air. Turn the pots round occasionally to prevent the roots growing through the drainage hole.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of the Parks and Open Spaces in the City of Cardiff.

Street Trees (continued).—In planting trees in streets it is necessary to excavate holes about 2 feet 6 inches square. If the soil is not of a suitable nature, fresh, good loam must be supplied to a further depth of 2 feet 6 inches, and enriched with manure, so as to give the young trees a good rooting medium at the start. When the trees are planted, paving stones should not be placed nearer the stem than 1 foot 6 inches, as this open space is necessary in order that air and moisture may reach the roots. Although it would be beneficial for the trees to keep the soil around the stems an inch or two below the surface of the pavement, inasmuch as rain could be the better collected, this is not practicable on account of the inconvenience it would cause to pedestrians, hence the soil has always to be kept flush with the general surface of the path or road.

Trees for street-planting should be rarely less than 10 feet high, should have clean, straight stems, and have no branches for at least a distance of 6 feet above the ground. It is essential to protect young trees in public streets, and for this purpose they are usually enclosed in iron ornamental tree guards. It is the provision of these latter which makes tree-planting such an expensive undertaking, but when once the guards are provided they can be used again and again if they are given the necessary repairs. A small bar of wood or iron, run horizontally across the top of the guard, is required as a stay on which to tie the trees—a matter which should be attended to immediately after planting. As the stem may be easily damaged by rubbing at the point where it is bound to the stay, it is a good practice to have this part protected by a piece of mat or carpet kept in position by wire netting. When by any means a tree breaks away from its stay and rubs against the top of the tree guard, this carpet band keeps the bark of the stem from becoming chafed until such time as it may be attended to and re-tied.

When in the course of a few years after planting the stems become stout enough to be self-supporting the tree guards may be removed. To prevent the trunk from being cut and damaged by mischievous persons, it is often found necessary on the removal of the tree guard to protect it by a band of 1-inch mesh wire netting up to a height of 6 feet. After the stems become 4 or 5 feet in circumference wire netting is not generally required.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, SEPTEMBER 14—Newton Mearns Fl. Sh.

MONDAY, SEPTEMBER 16—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, SEPTEMBER 17—
Roy. Hort. Soc. Coms. meet.
Brit. Gard. Assoc. Ex. Council meet.

SATURDAY, SEPTEMBER 21—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—56° 8'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 11 (6 P.M.): Max. 73°; Min. 47°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 12 (10 A.M.): Bar. 30.1; Temp., 63; Weather—Overcast.

PROVINCES.—Wednesday, September 11 (6 P.M.): Max. 67°; Dover; Min. 57°; Scotland E.
